

2-98 Anemone 1A

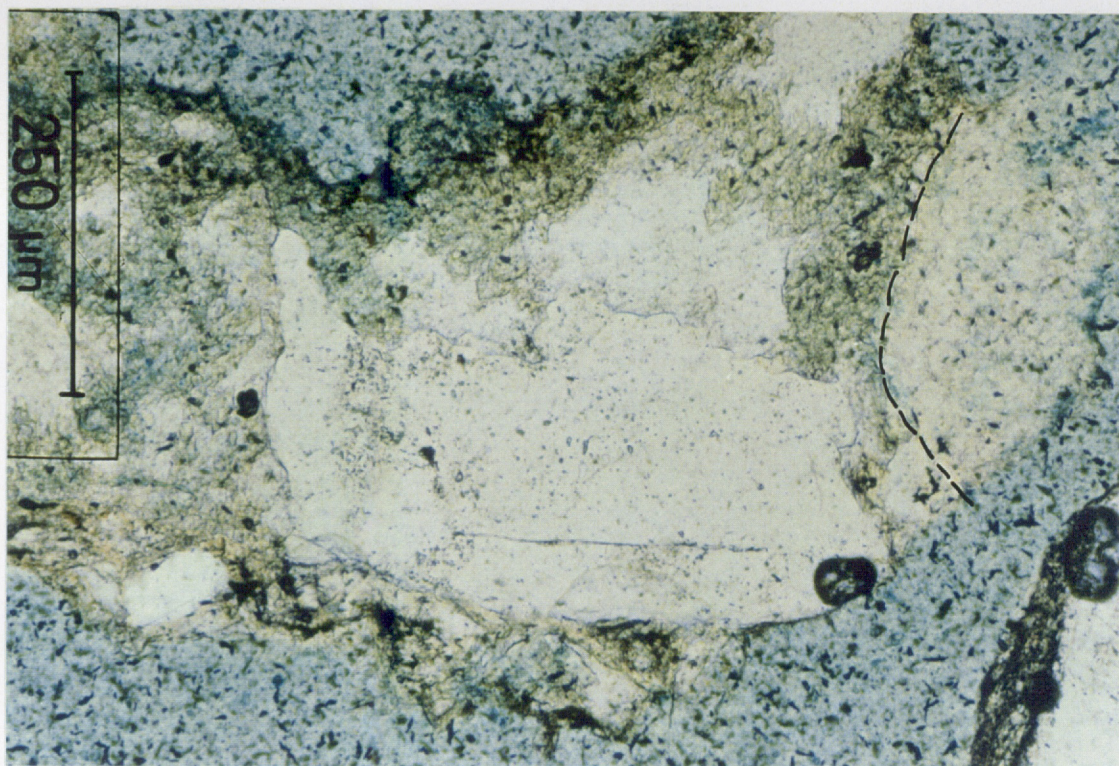

Figure 12 - Anemone #1A, cuttings 4540 - 45m. (Plane polarized light). Detail of a chip from the sample shows a composite microcline-orthoclase grain which has been extensively dissolved to create secondary porosity. The edge of the grain is shown in part by the dashed line. Outside that line is a primary pore now lined with illite then filled with kaolin.
