SYNTHETIC SEISMOGRAM REPORT

ATHENE NO. 1 17 AUG 1983

Phillips Petroleum Company Far East (Singapore)
Seismic Stratigraphy Section

WCA, TW

Well: Phillips Athene No. 1 is located S 38° 35' 52.188" and E 148° 27' 20.628" or approximately SP 1809 Line G72A-601 in the Gippsland Basin, Victoria, Australia. The final well logs were run July 8, 1983 to a TD of 3386 m. At the time of this writing the rig was still on location.

Logs: Sonic and density logs were edited to remove cycle skips and noise. The sonic log was interpolated from the start of the log at 550 m (RKB) to the sea floor at 288 m. A break from 180 μ sec/ft to 200 μ sec/ft was input at the sea floor in order to give a sea floor reflection. From 0 to 2750 m the density log was not recorded, Gardner's equation was used to estimate the density response within this interval.

Checkshots:

Checkshots were reviewed and edited. Values at 500, 750, 1100, 2370, 2861, 3117, 3224, 3299, and 3255 m were not used. Table 1 is a list of checkshots applied. A plot was made of the difference between the time-depth curve derived from integrating the sonic log without checkshots and the time-depth curve derived from the checkshot corrected sonic. This difference is the net checkshot correction applied to the integrated sonic log (figure 1). A fourth order trend was fit to the checkshot correction (not to the checkshots) in order to insure that no false, checkshot induced, reflection coefficients would be introduced into the data. This smoothed checkshot correction (figure 2) was applied to calibrate the integrated sonic log. Table 2 is a listing of the final, checkshot corrected, time-depth function.

Wavelets: Three Ricker wavelets (17, 20 and 25 Hz) and a Butterworth Bandpass wavelet (7-10-40-57) were used to generate synthetic seismograms. The Butterworth wavelet ties the seismic section (G72A-601 SP 1809, GSI migrated TCOMP) very well. Below 2100 ms the 20 Hz Ricker gives a marginally better match.

Problems: The matching polarity (+) at the Athene is opposite that of Helios, Hermes, and Selene wells (-). This is due to a polarity error in the plotting of seismic section G72A-601.

Other Displays:

Enclosure 5 is an interpretation montage showing the correlation between seismic sequences and the well stratigraphy. Enclosures 6 and 7 are condensed log displays in time and depth. Enclosure 8 is a composite display of the synthetic seismogram, gamma ray and resistivity logs.
