Dear Sir,

Core Laboratories Intermediate Extended Service Well Logging Unit FL802 was in use during the drilling of BREAM # 4A from surface to a total depth of 2421 metres.

Please find enclosed the IES well report, appended drilling parameter logs and the Corelab grapholog for your reference.

We appreciated being of assistance during the drilling operations and look forward to continuing our association on future wells.

If you require clarification of this report, please do not hesitate to contact us.

Yours very truly,
CORE LABORATORIES INTERNATIONAL LTD.

A. DODSON
Unit Supervisor

1 INTRODUCTION

BREAM 4A was drilled by ESSO Australia Ltd. in the Bass Strait, Australia.

Well co-ordinates were: - Latitude : $38^{\circ} 30' 26.928''S$
Longitude : $147^{\circ} 44' 50.240''E$

The well was drilled by South Seas Drilling Company's semi-submersible rig "Southern Cross", and monitored by Core Laboratories Intermediate Extended Service Field Laboratory 802.

BREAM 4A was spudded on 23rd July, 1981 and reached a total depth of 2421 metres on 18th September, 1981, a total drilling time of 26 days. The main objective of the well was to establish the western most extent of the Bream Field, and to confirm and evaluate the dimensions of the oil column.

Elevations were: - 21.0m Kelly bushings to mean sea level
58.6m Water depth
79.6m Kelly bushings to mud line

All depths used in this report and accompanying logs refer to depth below rotary kelly bushings (RKB).

Core Laboratories personnel involved in the logging of were as follows:

A. DODSON	- UNIT SUPERVISOR
N. DANKER	- LOGGING CREW CHIEF
B. GIFTSON	- WELL LOGGER
A. McCONVILLE	- WELL LOGGER
J. LANG	- WELL LOGGER

2 CORE LABORATORIES EQUIPMENT

Core Laboratories Field Laboratory 802 monitoring equipment includes the following :

A. MUD LOGGING

- 1.T.H.M. total gas detector and recorder
- 2.Hot wire total gas detector and recorder
- 3.F.I.D. (Flame Ionization Detector) chromatograph and recorder
- 4.Gas trap and support equipment for the above
- 5.Rate of Penetration recorder and digital display
- 6.Pit volume totalizer,display and recorder
- 7.Digital depth counter
- 8.Two integrated pump stroke counters,with digital display
- 9.Ultra-violet fluoroscope
- 10.Binocular microscope

B. INTERMEDIATE EXTENDED SERVICE PACKAGE

- 1.Hewlett Packard 9825B desktop computer
- 2.Hewlett Packard 9872B plotter
- 3.Hewlett Packard 2631A printer
- 4.Two Hewlett Packard 2621P visual display units,(one located in the client's office)
- 5.Hookload/weight on bit transducer and recorder
- 6.Rotary speed tachogenerator and recorder
- 7.Standpipe pump pressure transducer and recorder
- 8.Mud flow out sensor and recorder
- 9.Mud temperature sensors and recorder (in and out)
- 10.Mud conductivity sensors end recorder (in and out)
- 11.Rotary torque sensor and recorder
- 12.Shale density apparatus
- 13.Hydrogen sulphide gas detector
- 14.Carbon dioxide gas detector

3 CORE LABORATORIES MONITORING EQUIPMENT

DEPTH

Depth registered every 0.2 metres and rate of penetration calculated each metre (or every 0.2 m while coring). ROP displayed on digital panel and chart.

WEIGHT ON BIT

A Tyco 0-1000 psi,solid state pressure transducer is connected to the rig's deadline anchor.The weight on bit is calculated in the Rig Functions panel, and displayed (with hookload) on a digital meter and recorder chart

ROTARY SPEED

This is a DC generator for which 1 volt = 100 rpm, and which is belt-driven from the rotary drive shaft.The value is displayed on digital meter and recorder chart.

PUMP PRESSURE

This is a Tyco 0-5000 psi transducer mounted on the standpipe manifold. The pressure is displayed on digital panel meter and recorder chart.

PIT VOLUME

Six individual pits can be displayed on the meter.The pit volume total is calculated in the PVT panel and displayed on a digital meter.The sensors are vertical floats driving potentiometers accurate to +/- 1 barrel.Each sensor is equiped with a wave compensating device. In addition a sensor is fitted to the rig's trip tank, so that hole fill-up during trips may be closely monitored.A recorder chart displays the levels of the active pits, the pit volume total , and the trip tank.

PUMP STROKES

These are the limit switch type, counting individual strokes.The Pulse Data Box can monitor one or two pumps individually or integrate the total number of strokes from both pumps.The pump rate per minute is displayed on recorder chart.

ROTARY TORQUE

An American aerospace Controls bi-directional current sensor is clamped over the power cable of the rotary table motor. Torque is displayed on digital panel meter and recorder chart.

MUD TEMPERATURE

This is a platinum probe resistance thermometer, calibrated 0-100 deg.C. Temperature in and out is displayed on recorder chart and digital meter.

MUD CONDUCTIVITY

A Balsbaugh electrode-less conductivity sensor measures the current in a closed loop of solution coupling a pair of toroidal transformer coils.

The conductivity in and out is displayed on analog and digital meters, and recorder chart.

All the sensors are 5 to 24 v DC powered with the exception of the air driven gas trap. Along with monitoring and maintaining the above equipment, Core Lab furnished and operated certain other items.

CUTTINGS

Microscopic and ultra-violet inspection of cuttings samples at predetermined intervals. Dry samples were washed, dried and boxed. Wet samples were washed sacked and boxed. Geochemical samples were canned and boxed.

GAS

1. Flame Ionization Total Hydrocarbon gas detector.

The T.H.M. accurately determines hydrocarbon concentrations up to 100% saturation.

2. Flame Ionization Detector chromatograph.

The F.I.D. is capable of accurate determination of hydrocarbon concentration from C1 to C6+.

3. Hot wire gas detector (Wheatstone Bridge type)

A back up system for total gas detection.

SHALE DENSITY

Manual determination of shale density in an accurately calibrated variable density column.

4 INTERMEDIATE EXTENDED SERVICE INTRODUCTION

The Core Laboratories Intermediate Extended Service Package includes sensors, recorders and computer facilities useful in the drilling operation; for the detection of abnormal formation pressure; and the optimization of drilling.

Presented graphically on Core Laboratories I.E.S. logs (discussed individually in the following section of this report) are the various functions necessary for well control, abnormal formation pressure detection and drilling optimization.

Other available services include electric log interpretation programs for the wellsite geologist, hydraulics (synthesis and analysis), well kill, cost per foot, bit nozzle selection, swab and surge created by pipe movement and bit performance programmes for the wellsite drilling engineer.

Core Laboratories I.E.S. logs include the following :

I.E.S. PRESSURE LOG

Information plotted on this log includes formation pore pressure, mud weight in and formation fracture pressure. This is plotted on linear graph paper at a vertical scale of 1:5000. The formation pore pressure and fracture pressure gradients are based on all available information. This is a conclusion log, therefore the information may be modified by results from formation drill stem tests, data from adjacent wells, kicks, and formation breakdown tests.

CORELAB DRILL DATA PLOT

This plot, which is drawn while drilling is in progress, is the primary tool by which formation overpressure is detected. Drawn on a 1:5000 scale it is particularly useful in that five plots are drawn side by side, and thus any trend can be readily recognised.

The main plot is that of the corrected 'd' exponent, which is presented on a logarithmic scale. The 'd' exponent was first developed by Jordan and Shirley in 1966 to assist in interpreting rate of penetration data by normalizing for rotary speed and weight on bit per inch of bit diameter.

The modified 'dc' exponent was proposed by Rhem and McClendon to compensate for increases in mud weight. This involves multiplying the standard 'd' exponent value by the inverse ratio of the mud weight. A multiple of 9 ppg was used for convenience to return the magnitude of the 'dc' to a comparable value of it's uncorrected state. In this case, a multiplier of 10 ppg was used. The equation for 'dc' is therefore :

$$\begin{aligned} \text{Log } & \left(\frac{\text{RDP}}{\text{RPM} \times 60} \right) \\ "dc" = & \frac{\left(\frac{\text{WOB} \times 12}{\text{Bit diam} \times 1000} \right) \text{MDI}}{10} \end{aligned}$$

Deviations from the normal "dcs" trend may be interpreted as being due to a change in formation pore pressure. An equation derived by Eaton is used in an attempt to evaluate pore pressure from deviations in the "dcs" plot. This method of overpressure detection can be fairly accurate for homogeneous shales, but where the sand/silt/shale ratio varies a great deal, inaccuracies often occur.

The other main plots are a logarithmic rate of penetration, which complements the "dcs" plot and a linear plot of total mud gas.

Shale densities are also plotted on a linear scale in order to show up a decreasing density trend, and hence a possible transition into abnormally pressured shales. The points are determined by measuring the density of air dried shale samples in an accurately calibrated density solution.

An interpreted lithology column is also included on the log, as is a plot of mud density in, to assist in interpretation. All relevant information, such as casing points, bit runs, etc. are also included.

I.E.S. GEO-PLOT LOG

This is plotted by the computer while drilling is in progress. At a later date this plot can be re-run on different scales to suit the client. The data is stored on magnetic tape during the drilling operations. Functions plotted on this log are : rate of penetration, corrected "d" exponent, break-even analysis, formation pore pressure, mud density in and formation fracture pressure.

Two Geo-plots are included in this report, at scales of 1:2000 and 1:5000.

I.E.S. FLOWLINE TEMPERATURE, FLOWLINE TEMPERATURE END TO END PLOTS

Flowline temperature and end to end plot of flowline temperature are the two main plots relating to the temperature of the returning drilling fluid. These are plotted on a vertical scale of 1:5000. The use of these plots as an indicator of the presence of over-pressure takes secondary role to the I.E.S. drill log. Continuous observation of flowline temperature may indicate an increase in geothermal gradient. Factors affecting temperature are noted on the log, such as new bit runs, changes in the circulation rates, circulating cuttings out and the addition of water and chemicals to the active mud system. Since the goal of the end-to-end plot is to provide a representation of the geothermal gradient, all surface changes which would cause artificial changes in the flowline temperature are disregarded.

ELECTRIC LOG PLOT

A plot of shale resistivity (ohm-metres squared/metre), sonic travel time (microseconds per foot), bulk density (gm./cc) and neutron porosity (%), is made, using data supplied by Schlumberger. Two-cycle semilog paper is used, with a vertical scale of 1:10,000. As far as possible only clean shale points are selected and plotted. The relatively compressed vertical scale makes deviations from the normal compaction trend easier to identify.

The wireline log plot was omitted from this report as no suitable lithologies were drilled in Bream No 4A.

PROGRESS LOG

This is the traditional presentation of footage against elapsed time in days. It shows actual drilling time from spud to total depth.

DATA RECORDING

Data is recorded on tape while drilling both as raw input numbers and computer calculated numbers. This data can be accessed later for use in interpretative programs or to review data. Comprehensive data lists are included in this report.

MUD DATA SHEETS

These are a record of the mud properties while drilling and are derived from the mud engineer's daily report.

DRILLING PARAMETER PLOT

The drilling parameter plot shows : rate of penetration, weight on bit, rotary speed, pump pressure, hydraulic horsepower, impact force and jet velocity. This plot is drawn by the computer and is designed to aid the drilling engineer in drilling optimization. The scale chosen here is 1:5000.

HYDRAULIC ANALYSES

During drilling, routine hydraulic analyses are calculated by the computer, and these are made available to the drilling engineer. This report includes a sample hydraulics for each 100 M.

GAS COMPOSITION ANALYSIS

For each significant gas show, the chromatograph results are analysed using two techniques:-

1. Log plot
2. Triangulation plot

Both plots are included in this report.

GRAPHLOG

This is plotted on the industry standard form on a vertical scale of 1:500. Rate of penetration is plotted in metres per hour, together with mud gas chromatography results. Total gas is also plotted, and a percentage lithology log is drawn. A lithology description is presented in an abbreviated form. All relevant drilling data is included, as is bit and mud data.

MISCELLANEOUS

Various data collected from this well are also included in this report for reference. These include formation leak off test data, and R.F.T. and well test data where appropriate.

7 WELL HISTORY

WELL HISTORY

Bream 4 was drilled from 19-7-81 to 10-8-81. A 26" hole was drilled to 220m and 20" casing was run, however the riser parted whilst being run, and the B.O.P. fell to the seabed. The riser and B.O.P. stack were then recovered and dismantled, and the rig towed to the next location while the B.O.P. stack was being repaired.

Bream 4 A

- 18/8/81 Stabbed into the T.G.B. and drilled 3m of 26" hole. Moved the rig to centralise the hole opener in the T.G.B. Drilled a 26" hole to 172.9m and ran a deviation survey. (172.9m, $\frac{1}{2}^{\circ}$). Drilled to 220m spotting hi-vis pills each connection. Pumped 150 bbl. of hi-vis mud and ran a deviation survey. (220m, misrun). Flushed the hole with sea water and started to P.O.O.H. but found tight hole at 220m-210m, 100,000 lbs drag. Made a wiper trip and reamed the tight hole. Flushed the hole with mud and retrieved the survey tool at the B.H.A. Continued to P.O.O.H. and layed out the 17 $\frac{1}{2}$ " bit and 26" hole opener. Moved the T.G.B. and prepared to run the 20" casing.
- 19/8/81 Ran the 20" casing, installing centralisers on the first five joints and filling with sea water. Landed the 10 joints (length 127m) at 203.5m. On landing the slope indicator showed $2\frac{1}{2}^{\circ}$; after picking up and relanding the indicator showed $1\frac{1}{4}^{\circ}$. Rigged up the cement lines and pumped 150 bbl. of sea water. Pressure tested the cement lines to 5000 p.s.i. and set the casing at 203.5m using 627 sx class "N" cement mixed with 194 bbl. of 12% equivalent dry blend gelwater and 2% calcium chloride. Average slurry weight was 12.3 p.p.g. Tailed with 350 sx of class "N" cement mixed with 43 bbl. of 2% calcium chloride water. Average slurry weight was 15.6 p.p.g. Displaced with 15 $\frac{1}{2}$ bbl. of sea water, the float equipment holding O.K. Backed out the running tool and P.O.O.H.
- 20/8/81 Waited on the riser adaptor; - required to connect the well head and riser, the B.O.P. stack still being under repair.
- 21/8/81 Received the riser adaptor and commenced making it up.
- 22/8/81 Continued to make up the adaptor.
- 23/8/81 R.I.H. with wear bushing, installed and P.O.O.H. Made up the 17 $\frac{1}{2}$ " B.H.A. and R.I.H. Tagged the cement at 184.04m. Drilled out the cement and shoe, finding 5m of cement below the shoe. Reamed to the bottom and drilled a 17 $\frac{1}{2}$ " hole from 220m to 225m. Circulated out and brought the mud weight up to 9.0 p.p.g. P.O.O.H. and broke out the 17 $\frac{1}{2}$ " bit. Ran the TV and observed the well. Layed down the excess drill pipe. R.I.H. and drilled a 12 $\frac{1}{4}$ " hole from 225m to 498m. C.O. and ran a deviation survey. (498m, $\frac{1}{2}^{\circ}$)
- 24/8/81 Retrieved the survey tool and drilled a 12 $\frac{1}{4}$ " hole from 498m to 554m where the drill string was lost and dropped 14m when making a connection. Tagged and retrieved the string. P.O.O.H. and layed down DG and DP. Made up the bottom hole assembly for NB #3 and R.I.H. to 553m - found 1m fill. Drilled a 12 $\frac{1}{4}$ " hole from 554m to 678m. No T.G. was detected from 554m.

- 25/8/81 Drilled a $12\frac{1}{4}$ " hole from 678m to 804m. Circulated for 3/4 hr at 804m, pumped a slug and P.O.O.H. to the 20" casing shoe at 203m. R.I.H. to bottom; - found no fill. Circulated out and found 25u W.T.G. from 804m. Took a deviation survey (804m, $3\frac{1}{4}$ "). Pumped a slug and P.O.O.H. finding no drag. Broke down the B.H.A. and ran ISF-BHS-GR-CAL wireline logs. Made up the cement head and 13 3/8" casing hanger and running tool and stood back. R.I.H. with drill pipe and layed down to ream the hole from $12\frac{1}{4}$ " to $17\frac{1}{2}$ ". Made up the B.H.A. for RR # 3 and $17\frac{1}{2}$ " H.O.
- 26/8/81 Made up the bottom hole assembly and R.I.H. finding no trip gas as drilling was started at the 20" casing shoe. Reamed the hole from 184m to 789m.
- 27/8/81 Reamed from 789m to 804m. C.O. and took a deviation survey (804m, $3\frac{1}{4}$ "), pumped a slug and P.O.O.H. to the shoe, finding tight hole at 794m to 646m; - 165,000 lbs drag. R.I.H. to 804m and found no fill. Circulated out and detected 29u W.T.G., pumped a slug and P.O.O.H. to the shoe, finding no drag. Retrieved the wear bushing and ran the 13 3/8" casing. (61 joints of K55, 54.5 # Ft, 711m length, set at 789m). Installed centralizers on the float shoe and collar, and the first four joints and between joints 48 and 54. Filled the casing every five joints. Picked up and ran the landing string. Landed the hanger, and circulated 400 bbl of mud at 76 S.P.M. Changed a leaking chicksan and pressure tested the cement lines to 5000 p.s.i. and cemented with 10 bbl of freshwater followed by 692 sx grade "N" cement mixed with 85 bbl of fresh water. Average slurry weight was 15.6 p.p.g. Tailed with 250 sx class "N" cement mixed with 31 bbl of seawater. Average slurry weight was 15.6 p.p.g. Displaced with 2 bbl of water and 352 bbl of mud. Plug did not lump. Float equipment held OK. Rigged down the cement head and washed the hanger assembly using the chicksans.
- 28/8/81 Ran in with the jetting tool and washed the well head. P.O.O.H. set sea assembly, unlatched the riser and recovered the riser.
- 29/8/81 Unloaded the B.O.P. stack parts from the workboat.
- 30/8/81 Continued unloading the B.O.P. parts and started assembly of the stack.
- 31/8/81 to
2/9/81 Continued to assemble the B.O.P. stack and tested the stack.
- 3/9/81 Continued to test the B.O.P. stack and stabbed the riser into the stack. Ran the marine riser and connected the tensioner lines and choke and kill lines. Tested the casing rams, connector and shear rams. Tested the choke and kill lines to 5000 p.s.i. P.O.O.H. and layed down the test tool.
- 4/9/81 Made up the B.H.A. and R.I.H. with N.B.# 4, H.T.C. - X3A, $12\frac{1}{4}$ " and tagged the cement at 760m. Drilled out the cement, float and shoe, and cleaned out the rathole. Maximum rathole gas was 13u. Drilled from 804m to 810m (gas 4u), circulated out and pulled back to the shoe. Performed a P.I.T. to 600 p.s.i., with 9.0 p.p.g. mud, giving a P.I.T. of 13.5 + p.p.g. Drilled from 810m to 903m spotting hi-vis pills as required.

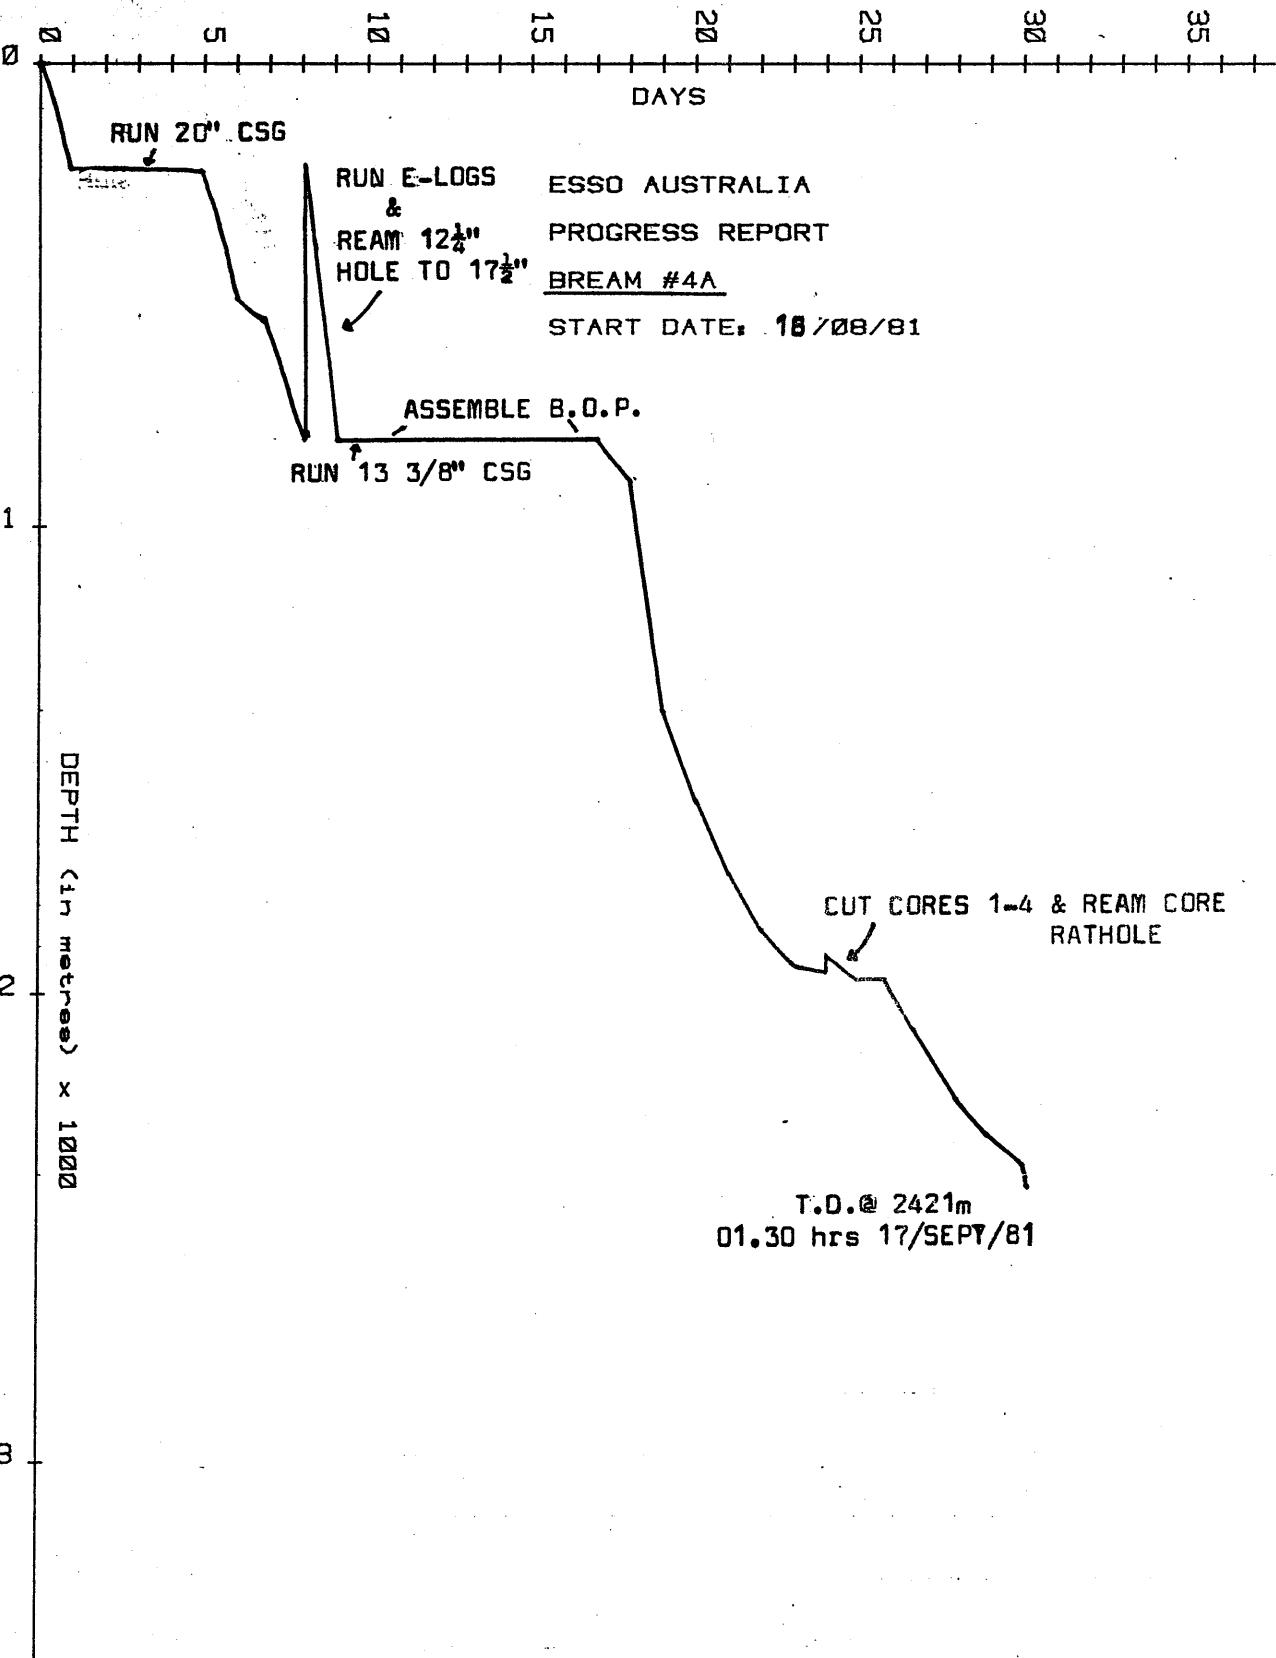

- 5/9/81 Drilled from 903m to 1150m where the hole packed off and 40 bbl of mud was lost. Drilled from 1150m to 1196m where due to the possibility of connection gas at 1164m, 1174m and 1183m (10-15-9 u) a '10-10-10' was performed. This was negative at 7-2-4u. It is possible that the cause of the connection gas was that more cuttings were coming over the shakers when the connection gas was due, as hi-vis pills were being pumped each connection. Drilled from 1196m to 1400m, circulated out and took a deviation survey. (1400m, 3°). Maximum gas throughout this zone was 27u at 1196m; - due to the repeated movement of the pipe while performing the 10-10-10. Background gas throughout this interval was 5u from 1100m to 1150m; 12u from 1150m to 1195m, and from 7 to 2u from 1195m to 1400m. Pulled out of the hole to the shoe finding drag of 10 to 50,000 lbs on the first seven stands.
- 6/9/81 R.I.H. and circulated out (W.T.G. 1-41-1u) and P.O.O.H. to 1100m and took a deviation survey (changed to 8° instrument) (1100m, 3/4"). Continued to P.O.O.H. R.I.H. with N.B.#5, H.T.C. - X3A, 12½" with the top stabiliser layed down.
- Started changing to a freshwater mud at 1400m and had a fully freshwater mud system at 1437m. Took a deviation survey at 1437m (1437m, 2½°). Trip gas from 1400m was 68u. The hole packed off at 1503m. Gas from this depth was 20u, this was probably caused by the repeated swabbing action when the annulus was blocked and the pipe worked at this depth. Drilled from 1503m to 1540m where the flowline plugged. Changed the shaker screens and drilled to 1559m where the flowline plugged again and the riser was flushed. Drilled to 1578m where the riser was flushed.
- 7/9/81 Drilled to 1620m where the flowline plugged and the riser was flushed. The riser was flushed every second single and the flowline jetted every single to prevent the gumbo blocking the annulus. Drilled to 1778m. The average background gas while drilling this section was 1 to 2u.
- 8/9/81 Drilled to 1778m, circulated out and took a deviation survey (1778m, 1½°) before pulling out of hole for a bit change. R.I.H. with N.B.#6, HTC-X3A, 12½" found no fill running in. Trip gas from 1778m was 6u. Drilled to 1866m with 0.3u background gas. The lithology was claystone and siltstone with occasional traces of loose sand. The gas composition at this depth started to become 'heavier' with C1 to C4 and occasionally C5 present. No drilling breaks were encountered.
- 9/9/81 Drilled to 1903m and circulated out, maximum gas was 77u, C1 to C6 however the lithology remained 90% siltstone and 10% sandstone. Drilled to 1915m and circulated out again. A drilling break occurred from 1912m to 1916m; the R.O.P. changing from a uniform 10 m/hr to 34 m hr. Maximum gas from the drilling break was 58u, C1 to C6, the lithology remained the same. Drilled to 1920m and circulated out, maximum gas was 170u, C1 to C6 with a lithology change to 60% loose sand. It was decided to cut a core at this point. The riser was flushed and a deviation survey taken. (1920m, 3/4°). Pulled out of the hole. R.I.H. with a Christensen C-22 core head and core barrel to cut core#1. Ran to bottom and circulated out. Trip gas was 62u. Cut core #1, 1920m to 1929.5m - cut 9.5m, recovered 9.5m (100%). Maximum gas while coring was 9u at 1921m. (The flowrate was 265 gpm). The core was cut in 6.0 hrs. P.O.O.H. and recovered the core and ran in the hole with a new C-22 core head as the first core head was found to be 80% worn when recovered.

- 10/9/81 It was not possible to get into the rathole with the core barrel so the head was run to 1920m and washed and reamed to 1929.5m. Circulated out and found 25u T.G. from 1929.5m. Flushed the riser and cut core #2; 1929.5m to 1939.4m, cut 9.9m, recovered 9.2m. (93%) P.O.O.H. and recovered the core, and R.I.H. with the same head to cut core # 3. Found fill at 1923.9m, so washed and reamed to 1939.4m. Circulated out and found 25u T.G. from 1939.4m. (no gas was detected from the cored zones of core # 2,3, and 4 due to the low flowrates while coring). Cut core # 3 from 1939.4m to 1948.9m; cut 9.5m, recovered 9.1m (96%).
- 11/9/81 P.O.O.H. and recovered # 3. R.I.H. with the jetting tool. P.O.O.H. with the jetting tool and recovered the wear bushing. Ran the B.O.P. test tool and tested the B.O.P. stack. R.I.H. with R.R. # 6, HTC - X3A, 12 $\frac{1}{4}$ " to ream the core rathole. Reamed the 8 15/32" rathole from 1920m to 1948m, circulated out (5u T.G. from 1948m) and flushed the riser.
- 12/9/81 P.O.O.H. and ran in the hole with a new Christensen C-22 core head and 30' barrel to cut core # 4. R.I.H. to 1935m and circulated out, went to bottom and took weight at 1948m. The pump pressure did not increase until 1951m. Flushed the riser and cut core # 4 from 1951.0m to 1960.1m, cut 9.1m, recovered 4.6m. (50.5%) P.O.O.H. and recovered core # 4. While recovering core # 4 Core Lab detected 30 p.p.m. hydrogen sulphide gas in the atmosphere when the detector was placed immediately above the core trays with the recovered core. R.I.H. with N.B. # 10, H.T.C. - X.D.G., 12 $\frac{1}{4}$ ". Found tight hole at 1945m, reamed from 1945m to 1950m with high torque. It was probable that the fill and torque were due to the unrecovered core of core #4 (4.6m unrecovered).
- 13/9/81 Reamed from 1950m to 1961m, and drilled from 1961m to 2030m where it was decided to pull the bit due to the low R.O.P. below 2026m (see computer data list A) and the high cumulative cost (see computer data list B). Flushed the riser at 2030m, took a deviation survey (2030m, 3/4") and P.O.O.H. Although N.B. # 10 had a drilling time of 9.0 hrs. (8.5 hrs on bottom) the teeth were very badly worn (graded 7-3-3/16") and it was decided to run an insert bit next. R.I.H. with N.B. # 11, H.T.C.-J22, 12 $\frac{1}{4}$ ". Detected 6u trip gas from 2030m and drilled from 2030m to 2064m, with a background gas of 2u.
- 14/9/81 Drilled from 2064m to 2213m, with an average R.O.P. of 6 m/hr. Background gas was 2u, and the maximum gas detected was 32u at 2202m (sandstone). The riser was flushed at 2204m and a flow check made at 2208m. The coals in this section drilled with a high torque.
- 15/9/81 Drilled from 2213m to 2231.6m, the R.O.P. decreasing to around 2.2 m/hr. (See computer data list A). It was decided to change the bit at this time. Took a deviation survey, (2231m, 3/4") flushed the riser and P.O.O.H.
- When the bit was examined it was found that it was not as worn as was expected, (graded 2-4-In). R.I.H. with N.B. # 12, H.T.C. - XDV, 12 $\frac{1}{4}$ " found no fill and drilled from 2231.6m to 2317m. The lithology was interbedded sandstone and siltstone with occasional coals, the background gas was 3u. Trip gas from 2231m was 9u and the maximum gas recorded was 30u at 2224m in coal. Flushed the riser at 2317m.

- 16/9/81 Drilled from 2317m to 2336m, the R.O.P. decreasing to around 2.6 m/hr. (See computer data list A). The increasing cumulative cost also indicated that the bit should be changed at this time. (See computer data list B and the cost analysis log). Due to the low R.O.P. it was decided to change the bit. A deviation survey was attempted but gave a misrun. Started to P.O.O.H. and found shiny spots at 66.5m indicating wear at the ball joint. The alignment tool was run, but the ball joint alignment was found to be alright; the riser angle was 1. 3/4°. Bit # 12 was graded at 6-4-1/8, however it was expected that T.D. was to be around 2421m; - only 80m deeper, so the same bit type was chosen. R.I.H. with NB # 13; - H.T.C. - XDV, 12½". Found no fill on bottom and found 9u T.G. from 2336m. Drilled from 2336m to 2358m. Drilling breaks occurred at 2340m to 2341m, the break was not circulated out, it was found to be coal giving 23u gas. A further drilling break occurred at 2356m to 2358m, the R.O.P. increasing from 6 to 15 m/hr; drilling was stopped and the break circulated out, no shows were found. Circulation gas from circulating the break was 2u and the shakers were reasonably clean. Drilled on to 2394m with 3u background gas.
- 17/9/81 Drilled to 2421m, circulated out and took a deviation survey. (2421m, 3/4°) P.O.O.H. to the shoe and ran back to bottom and found no fill, there was very little drag while P.O.O.H. and no swabbing. Circulated out at T.D. and found 4u W.T.G., P.O.O.H. with no swab and very little drag. Flushed the riser and rigged up to run wireline logs.
- Run #1: ISF-BHC-MSFL-GR, 2421 - 789m, Max B.H.T. 171.5°F
- 18/9/81 Continue to run wireline logs: -
- Run #2: LDT-CNL-GR , 2421 - 789m, Max B.H.T. 178°F
Run #3: DLL-GR , 2420 - 1850m, Max B.H.T. 183°F
Run #4: HDT , 2420 - 1850m, Max B.H.T. 195°F
- Ran velocity survey tool, took readings between 2419m and 475m and ran the R.F.T. taking 9 pretest from 1917 to 1990m.
- 19/9/81 Continued to run the R.F.T., took 5 presets from 2013 to 2279m. After pretesting at 2279m the tool would not pull free, this was the first indication of hole problems. Worked on the tool, the pressure readings indicated that the tool was moving down but the tool would not pull above 2279m. Stretching indicated that the wire was free and only the tool was stuck. Worked the tool with 4500 lbs of overpull but would not come free. Stripped into the hole with an overshot and drill pipe, circulated the pipe volume and flushed the overshot and engaged the fish at 2267m. Broke the Schlumberger line with 6000 lbs pull and retrieved the line.
- 20/9/81 Recovered the R.F.T. and R.I.H. to make a wipertrip. Found very little drag and no fill. Circulated and conditioned the mud at 2421m, on circulating 12% CO₂ was detected and 8u T.G.Flushed the riser and P.O.O.H. Made R.F.T. run #2 and took a sample at 1944.5m came out of hole with the R.F.T.

- 21/9/81 Made R.F.T. run #3 taking a sample at 1934.5m and recovered the sample. Made R.F.T. run #4 taking a sample at 1938.5m with the 2 3/4 gall. chamber and at 1935.5m with the 1 gall. chamber. Recovered the sample and made R.F.T. run #5 taking a sample at 1949.5m with the 1 gall. chamber and at 1935.5m with the 6 gall. chamber. Recovered the sample. Tested the B.O.P. and made a wiper trip.
- 22/9/81 R.I.H., found no fill and circulated and flushed the riser. Detected 18u T.G. P.O.O.H. Made R.F.T. run #6, took a segregated sample with the six and one gallon chambers at 1951m. Recovered the sample and ran CST # 1 taking 51 shoes with 100% recovery between 2407.5 and 1935.5m. Layed down CST # 1 and run CST # 2 taking 51 shoes between 1929.8 and 808.5m.
- 23/9/81 Recovered CST # 2 (recovered 50, lost 1). R.I.H. with O.E.D.P. to 1890m and circulated, maximum gas was 16u from 1890m. Pumped 7 bbls of water and tested the cement lines to 2000 p.s.i. Set plug # 1 from 1980 to 1836m with 305 sx of class "N" cement using 1% HR-6L in 38 bbls of mix water. Slurry weight was 15.6 p.p.g. P.O.O.H. ten stands and circulated out and found around 40 bbls. of contaminated mud. Layed down the excess drill pipe and R.I.H. slowly and broke circulation at 1781m. Continued to R.I.H. slowly and tagged the cement at 1836m with 30,000 lbs weight. P.O.O.H. to 820m laying down D.P. and circulated, the returns going via the choke and kill lines the flowline connector being unlatched. Pressure tested the cement lines to 3000 p.s.i. Pumped 14 bbls of water followed by plug # 2 from 820m to 720m. Cemented with 282 sx of class "N" cement used neat with 35 bbls of seawater, average slurry weight was 15.6 p.p.g. This was followed by 2 bbls of water and 40 bbls of mud. P.O.O.H. 10 stands and reverse circulated out, dumping around 10 bbls of contaminated returns. P.O.O.H. and layed down 15 joints of drill pipe.
- 24/9/81 Rigged up Schlumberger and ran 13 3/8" GR-JB-CCL to 360m. Tested cement plug # 2 and shear rams to 1000 p.s.i. Ran a 13 3/8" EZSV bridge plug and set at 350m. Made up and ran the perforating gun between 150 and 152m. Made up and ran the cement retainer at 135m. Run in with stinger and sting into retainer. Pumped 390 sx of class "N" cement in saltwater. Squeezed 390 sx below the retainer and dumped 81 on top of the retainer, slurry weight was 15.2 p.p.g. P.O.O.H. to 85m and circulated with seawater. P.O.O.H. and layed down drill pipe. Retrieved the wear bushing and rigged up to retrieve the B.O:P. Had to wait on weather.

11 GEOLOGICAL SUMMARY

WELL: - BREAM 4A

GEOLOGICAL PROFILE

The primary object of Bream 4A was to establish the western most extent of the Bream field and evaluate the dimensions of the oil column. A brief summary of lithologies encountered while drilling Bream 4A is given below:-

All depths from RKB

GIPPSLAND LIMESTONE DEPTH 80m-1005m

As predicted in this zone, Limestone was the most predominant lithology encountered. The limestone being calcaranitic, light grey to grey, firm to medium grained, occasionally sandy to silty and carbonaceous in part and with traces of fossils, shell fragments, grading to marl, and with minor traces of dolomite and glauconite. Occasionally cuttings displayed mineral fluorescence. The other major lithology encountered in this section was sandstone. From 250 mtrs sandstone was encountered as minor stringers but increasing with depth until 500 mtrs. The sandstone was found to be white, very fine to fine grained, sub-rounded, very consolidated to occasionally unconsolidated quartz grains grading to calcaranite, silty to very silty, friable, and with traces of forams and shell fragments. Background gas in this zone was averaging about 2-5 units the maximum gas was about 11 units from 784 metres.

LAKES ENTRANCES DEPTH 1005m-1859m

The upper portion of this zone was found to be limestone which was very similar to those described above. Siltstone was first encountered as thin seams and gradually increasing in thickness with depth. The siltstone was light grey to grey occasionally dark grey, sticky, blocky, very calcareous, sandy in part and with a carbonaceous matrix. Traces of pyrite and glauconite were present throughout this section, and to a lesser extent traces of forams. Towards the middle of this section a very calcareous shale was encountered, the shale being light grey to grey, soft-firm, occasionally blocky to splintery and brittle, laminated, fissile to sub-fissile. With increasing depth the shale was found to be less laminated, hard to moderately hard and becoming more silty and sandy in part. Sandstone was present in minor stringers, and found to be clear to grey occasionally yellowish, loose, soft to friable, very fine to fine grains, poorly sorted to moderately sorted, sub-rounded, sub spherical, very calcareous and carbonaceous with traces of glauconite, forams, fossils and very to occasionally pyritic. The other lithology found to a lesser extent was claystone, which was light grey to grey, soft with a carbonaceous matrix, and very calcareous. Background gas was averaging about 2-8 units and the highest gas reading was about 27 units from 1148 meters, and from 1820 meters onwards cl-c6 were recorded from the chromatograph.

TOP OF GURNARD FORMATION 1859m to 1916m

As predicted siltstone was dominant in this portion and was found to be quite similar to those described in the above section, claystone was light grey to grey, soft, sticky, silty in part and with a carbonaceous matrix. Sandstone occurring as minor stringers and gradually increasing in volume with depth was described as light grey to grey, soft to friable, very fine to fine grains, poorly to moderately well sorted, sub angular

to sub rounded, calcareous with a carbonaceous matrix. Traces of glauconite were present throughout this section. The average background gas was about 9-11 units and the highest peak was about 143 units from 1916 metres, Cl-C6 was present throughout this section.

TOP OF "COARSE CLASTIC" 1916m-1960m

This section was predominantly sandstone with minor coal interbeds. The sandstone was similar to those of the above section but displayed bright yellow fluorescence, and a fast streaming cut present. Four cores were cut in this section with primary objectives of confirming the dimensions of the oil column. Recoveries from the cores were fairer.

TOP OF P. ASPEROPOLUS TO T.D. 1960m to 2421m

Coal was predominant in the upper portion of this section, occurring in thick interbeds. The coal was found as black to brown, shiny, moderately hard to very hard and blocky to platy. From the middle section of this zone sandstone was present. The sandstone was found to be clear to white to milky, medium coarse to coarse grained, loose, sub-angular to sub-rounded and occasionally traces of yellow fluorescence were, but did not cut. Traces of pyrite, calcite and glauconite were occasionally present. Siltstone was also present to a lesser. The siltstone being light brown to reddish brown, hard to very hard, fissile, blocky to platy, calcareous to non calcareous with a carbonaceous matrix and sandy in part. Traces of glauconite and pyrite were observed. The average background gas was 4 to 8 units and the highest recorded was 30 units from 2155 metres, Cl was present throughout this zone with traces of C2.

14 GAS COMPOSITION ANALYSIS

The composition of entrained reservoir gas in the mud is significant in determining the origin and the value of a show. Two graphical methods are employed for processing the mud gas chromatography results. These techniques however are empirical and by no means definitive.

LOG PLOT

The ratios of C₁/C₂, C₁/C₃, C₁/C₄, C₁/C₅ and C₁/C₆ are plotted on three-cycle log paper for each hydrocarbon show. The plots can be evaluated by the following criteria :

1. Productive dry gas zones may show only C₁, but abnormally high shows of C₁ are usually indicative of saltwater.
2. A ratio of C₁/C₂ between approximately 2 and 15 indicates oil and between 15 and 65, gas. If the C₁/C₂ ratio is below about 2, or above about 65, the zone is probably non-productive.
The actual values of the gas/oil/water limits will vary from area to area.
3. If the C₁/C₂ ratio is low in the oil section and the C₁/C₄ ratio is high in the gas section, the zone is probably non-productive.
4. If any ratio (with the exception of C₁/C₅, if oil is used in the mud) is lower than the preceding ratio, the zone is probably non-productive.
5. The ratios may not be definitive for low permeability zones; however, steep ratio plots may indicate a tight zone.

TRIANGULATION PLOT

The triangular diagram is obtained by tracing lines on three scales at 120 degrees to each other, corresponding respectively to the ratios of C₂, C₃ and normal C₄ to the total gas (C₁ to nC₄). The scales are arranged in such a way that if the apex of the triangle is upward, a gas zone is indicated, while if the apex points downward, an oil zone is suggested.

A large triangle plot represents dry gas or low GOR oil, while small triangles represent wet gases or high GOR oils. The homothetic centre of the plot should fall inside the top part of the triangle, otherwise the heavier hydrocarbon is abnormal and may indicate a dead show, (or coal gas).

DISCUSSION OF GAS COMPOSITION ANALYSIS PLOTS

Gas analysis plots could not be made for the cored zone due to the low flow rate whilst coring. The gas from the cored zone was not circulated to the surface while drilling.

Gas analysis plots were made from chromatograph results at the following depths: -

- (a) 1916m (RKB)

This plot indicates that the reservoir fluid at this depth is dry gas and the formation probably having medium to good permeability.

- (b) 1918m (RKB)

This plot again indicates that the reservoir fluid is gas, and the formation probably having medium to good permeability. However it can be seen that the plots indicate that the gas is wetter than at 1916m.

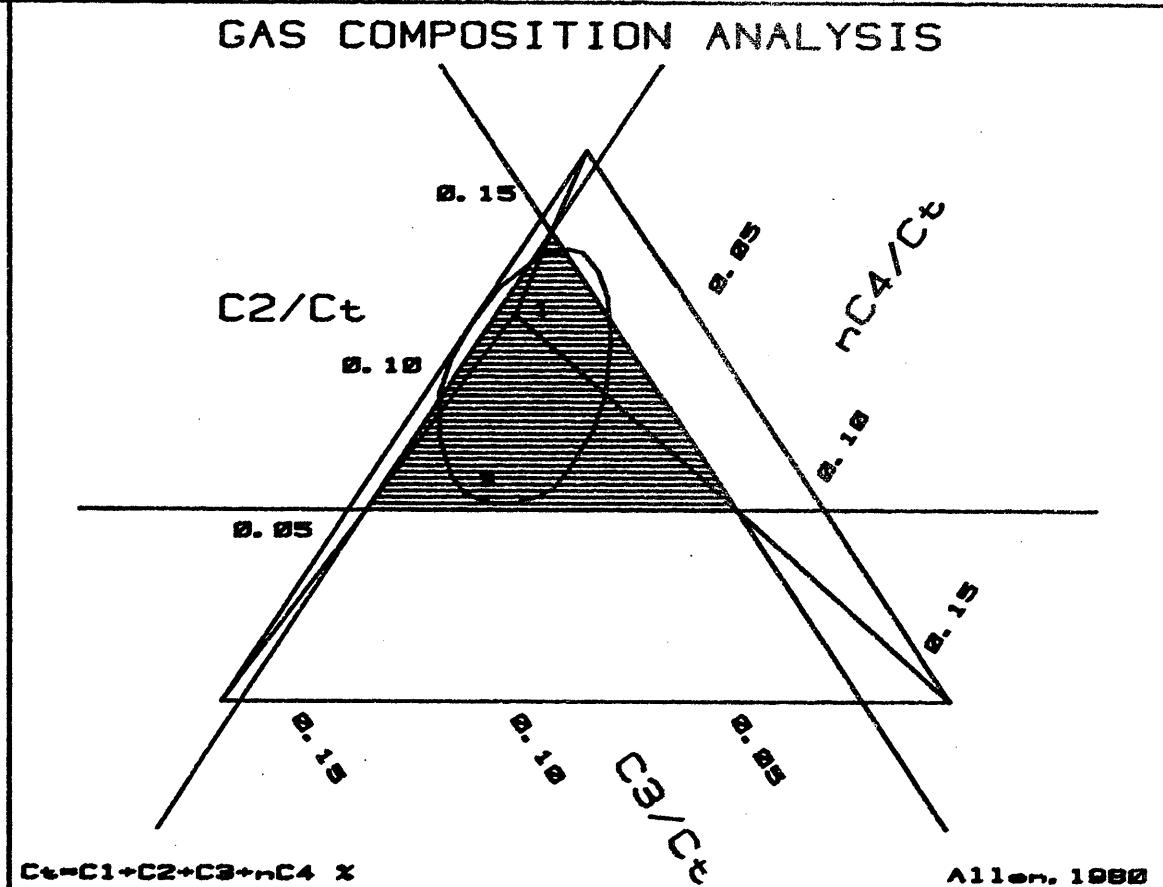

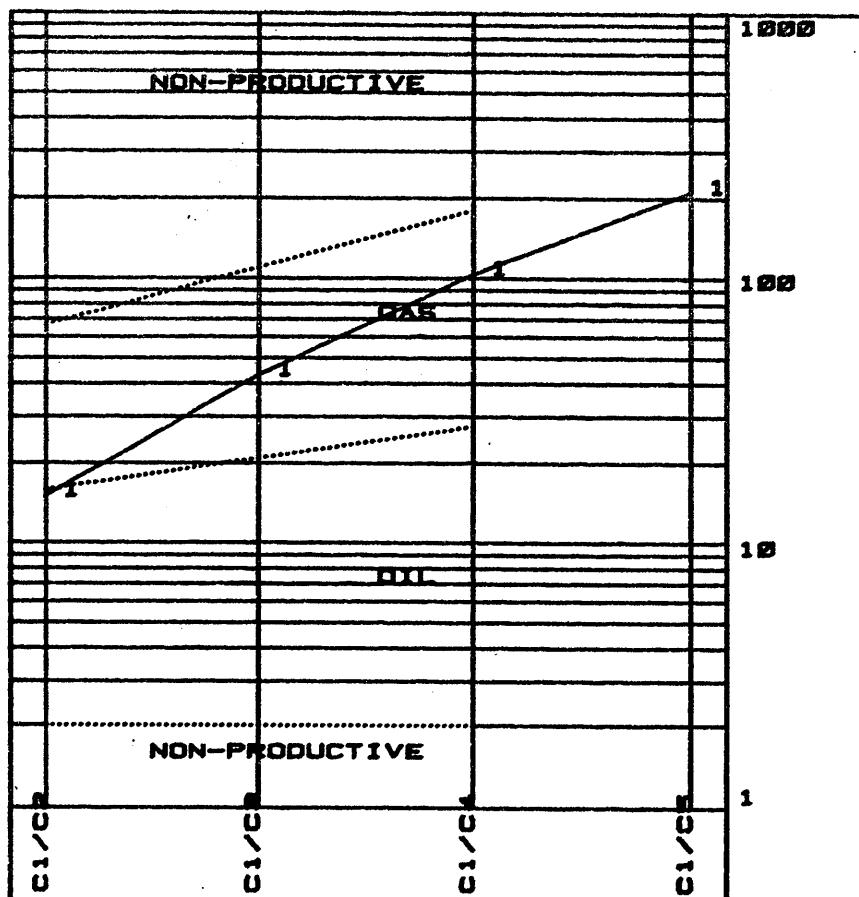

- (c) 1919m (RKB)

This plot is in agreement with the analysis made for the reservoir fluid at 1918m. The plot again indicates a dry to wet gas. At 1920m the first core was taken and further analyses could not be carried out.

16. PORE PRESSURE INTERPRETATION & LOT / PIT DATA

BREAM # 4A, PORE PRESSURE AND L.O.T. SUMMARY

Bream # 4A was drilled in the Gippsland basin, it is thought that this basin is normally pressured and abnormal pressure was not expected. Core Laboratories unit FL 802 monitored and calculated various parameters associated with pressure detection, the primary means of detection being the Drill Data Plot. (see plots at end of report)

The "Drill Data Plot" shows the dc exponent trend. As can be seen from the plot a good trend does not develop until around 670m. There is a lateral shift in the trend at 864m where the bit size was changed after running casing. A normal trend is followed to 1070m where there is a reversal; this was due to a slight change in lithology, the calcarenite becoming more silty. From this point there is a very gradual increase in the silt content and this shows up as a reversal in the trend.

At 1400m the bit was pulled and the mud changed, the shift here is due to the increased rate of penetration of the new bit. From 1400m to 1550m the dc exponent shows an exaggerated trend with the rate of penetration being controlled due to the 'gumbo' problems encountered here. A good normal trend is established between 1710m and 1860m. From 1916m where the top of the 'coarse clastics' formation is located until total depth at 2421m. The dc exponent points are completely scattered due to the unfavourable lithologies; - interbedded sandstones and coal beds. No trend can be established in this section.

In summary the dc exponent shows a normal trend to 1916m, from which point a trend cannot be established. The only abnormality in the mud gas plot is the slight increase in background gas around 1150m from five to ten units. It is possible that this and the possible connection gas shown at 1164m and 1178m are due to the increased swabbing action of the high yield mud, and because at this point hi-vis pills were slugged resulting in a greater volume of cuttings going over the shakers.

No shale density measurements were taken as no true shales were encountered. Silty sub-fissile shales occurred around 1450m but these cuttings disintegrating too easily in the density column.

As may be expected the temperature plot does not show any deviations away from normal. The geothermal gradient was $3.50^{\circ}\text{C}/100\text{m}$ ($6.32^{\circ}\text{F}/100\text{m}$).

As previously mentioned it was not possible to draw a 'Wireline Plot' as this log plots shale parameters and the few shale points encountered in the well were insufficient to draw a plot from, and were from poor quality shales.

The 'Pressure Plot' is the conclusion log for the well. As can be seen it shows that the formations encountered in the drilling of Bream # 4A are believed to be normally pressured throughout. The quantitative data for this log is from the R.F.T. tests run in the sands around 1917m to 2279m (from R.K.B.). As can be seen the pressure pre-tests in the water saturated sands had a pressure gradient of 1.445 p.s.i./m, this is equivalent to a pore pressure of 8.5 p.p.g. (FM. M.S.L.) or 8.6 p.p.g. (FM R.K.B.). It is believed that this pore pressure of 8.5 p.p.g. E.M.W. is representative of the pressure gradient for the formations above the Latrobe.

Overburden gradient calculations and a plot of the gradient are included in the report. It was not possible to derive a true fracture gradient as insufficient L.O.T. were taken; in fact only one P.I.T. was taken below the 13 3/8" casing. There was no need to carry out L.O.T. as high mud weights were not anticipated. The P.I.T. that was carried out gave a value of $13.5 + p.p.g.$ E.M.W. (See Well History section). Based on this information the fracture gradient on the "Pressure Plot" was drawn. The shape of the curve is based on data from wells in the U.S. Gulf Coast basin, and offset to match local data. A true fracture gradient for the Gippsland Basin cannot be drawn until further leak-off data is available.

17 COMPUTER DATA LISTINGS

Data is fed to the computer while drilling is in progress, using the Drill program and is stored on the tape at 10,1, or 0.2 m intervals. This data is then available at a later date for use in other programs (for example,KICK,SURGE,COST,OPTBIT and HYDRL).

The data can also be accessed by the REPORT program, which allows the operator to list both raw and calculated data in various formats. Either detailed data or data averaged over any particular depth interval, may be listed.

In addition, the data may be plotted in various formats, at any scale the operator desires.

The following data lists have been made for this well :

- a. Bit record
- b. Hydraulic analyses
- c. Data list A
- d. Data list B
- e. Data list C
- f. Data list D

COMPUTER PLOTS

Using the REPORT program, the following plots have been drawn for this well :

GEOPLOT - 1:5000 SCALE - 2m average

GEOPLOT 1:2000 SCALE - 2m average

DRILLING PARAMETER PLOT - 1:5000 SCALE - 2m average

COST ANALYSIS PLOT - 1:2000 SCALE - 2m average

Since all the data is stored on tape, further data lists or plots are available at any time on request.

HYDRAULIC ANALYSIS

Data listed from data tape every 100m for each bit run.

DEPTH. Metres

FLOW RATE. Rate of mud flow into the well,
in gallons per minute

ANNULAR VOLUMES. . . Barrels, Barrels/metre

ANNULAR VELOCITIES . . Metres/minute

CRITICAL VELOCITIES. . The annular velocity above which
the flow becomes turbulent

SLIP VELOCITY. . . . The rate of slip of cuttings in the
annulus under laminar flow

ASCEND VELOCITY. . . . The rate of ascent of cuttings in the
annulus under laminar flow

PRESSURE UNITS . . . Pounds per square inch

HHP. Hydraulic horsepower at the bit

IMPACT FORCE The impact force at the bit,
in foot pound per second squared

JET VELOCITY The velocity of mud through the bit
nozzles, in metres per second

DENSITY UNITS. . . . Pounds per gallon

COMPUTER DATA LISTING : LIST A

INTERVAL	All depth records (data not averaged)
DEPTH.	Well depth,in metres
ROP.	Rate of penetration;in metres/hour
WOB.	Weight on bit,in thousands of pounds
RPM.	Rotary speed,in revolutions per minute
MW	Mud weight in,in pounds per gallon
"dc"	Calculated "d" exponent,corrected for variations in mud weight in, using a correction factor of 10 ppg
HOURS.	Cumulative bit hours.The number of hours that the bit has actually been "on bottom",recorded in decimal hours
TURNS.	Cumulative bit turns.The number of turns made by the bit,while actually"on bottom"
ICOST.	Incremental cost per metre,calculated from the rate of penetration,in A dollars
CCOST.	Cumulative cost per metre,calculated from the drilling time,in A dollars
PP	Pore pressure gradient,in equivilant pounds per gallon.The pressure exerted by the fluid in the pore spaces of the formation
FG	Fracture gradient,in equivilant pounds per gallon.The pressure required to fracture the formation,calculated by the DRILL program using Eaton's equation It is dependant on the pore pressure,the overburden gradient and the matrix stress. This value may be modified by leak-off information

COMPUTER DATA LISTING : LIST B

INTERVAL 10 m average

DEPTH. Well depth, in metres

ROP. Rate of penetration, in metres per hour

BIT RUN. Depth interval drilled by the bit, in metres

HOURS. Cumulative bit hours. The number of hours
that the bit has actually been "on bottom",
recorded in decimal hours

TURNS. Cumulative bit turns. The number of turns
made by the bit, while actually "on bottom"

TOTAL COST Cumulative bit cost, in A dollars

ICOST. Incremental cost per metre, calculated
from the drilling time, in A dollars

CCOST. Cumulative cost per metre, calculated
from the drilling time, in A dollars

IC ICOST minus CCOST; expressed as a positive
or negative sign. When the bit becomes worn,
this should change from negative to positive

COMPUTER DATA LISTING : LIST C

INTERVAL 10 m average

DEPTH Well depth, in metres

FLOW RATE Mud flew into the well,
in gallons per minute

PSP Pump pressure, in pounds
per square inch

PBIT Bit pressure drop,
in pounds per square inch

% PSP Percentage of surface pressure
dropped at the bit

HHP Bit hydraulic horsepower

HHP/SQ IN Bit hydraulic horsepower per
square inch of bit diameter

IMPACT FORCE Bit impact force, in foot
pound per second squared

JET VELOCITY Mud velocity through the bit
nozzles, in metres per second

COMPUTER DATA LISTING : LIST D

INTERVAL 10 m average

DEPTH Well depth, in metres

SPM1 Stroke rate per minute,
for pump No 1

SPM2 Stroke rate per minute,
for pump No 2

FLOW RATE Mud flow rate into the well,
in gallons per minute

ANNULAR VELOCITIES : (in metres per minute)

DC/OH - Between drill collars and the open hole

DC/CSG - Between drill collars and casing

HW/OH - Between heavyweight drill pipe and the open hole

HW/CSG - Between heavyweight drill pipe and casing

DP/OH - Between drill pipe and open hole

DP/CSG - Between drill pipe and casing

DP/RIS - Between drill pipe and riser

PE603673

This is an enclosure indicator page.
The enclosure PE603673 is enclosed within the
container PE903952 at this location in this
document.

The enclosure PE603673 has the following characteristics:
ITEM_BARCODE = PE603673
CONTAINER_BARCODE = PE903952
NAME = Bream 4A Drill Data Plot
BASIN = GIPPSLAND
PERMIT = VIC/P1
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Bream 4A Drill Data Plot. From
Attachment 1 of WCR.
REMARKS =
DATE_CREATED = 17/09/81
DATE RECEIVED = 29/04/82
W_NO = W752
WELL_NAME = Bream-4A
CONTRACTOR = Core Laboratories Australia (QLD) Ltd.
CLIENT_OP_CO = Esso Australia Ltd

(Inserted by DNRE - Vic Govt Mines Dept)

PE603674

This is an enclosure indicator page.
The enclosure PE603674 is enclosed within the
container PE903952 at this location in this
document.

The enclosure PE603674 has the following characteristics:

ITEM_BARCODE = PE603674
CONTAINER_BARCODE = PE903952
NAME = Bream 4A Geoplot Log
BASIN = GIPPSLAND
PERMIT = VIC/P1
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Bream 4A Geoplot Log from Attachment 1
of WCR
REMARKS =
DATE_CREATED = 17/09/81
DATE RECEIVED = 29/04/82
W_NO = W752
WELL_NAME = Bream-4A
CONTRACTOR = Core Laboratories Australia (QLD) Ltd.
CLIENT_OP_CO = Esso Australia Ltd

(Inserted by DNRE - Vic Govt Mines Dept)

PE603675

This is an enclosure indicator page.
The enclosure PE603675 is enclosed within the
container PE903952 at this location in this
document.

The enclosure PE603675 has the following characteristics:

ITEM_BARCODE = PE603675
CONTAINER_BARCODE = PE903952
NAME = Bream 4A Temperature Log
BASIN = GIPPSLAND
PERMIT = VIC/P1
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Bream 4A Temperature Plot from
Attachment 1 of WCR.
REMARKS =
DATE_CREATED = 17/09/81
DATE RECEIVED = 29/04/82
