Dear Sir,

Accompanying this well report for your inspection and reference, are all logs and relevant data (computer recorded) pertaining to the drilling of OPAH # 1. If you have any queries or suggestions on the presentation of this well report and data found within, do not hesitate to contact us.

Core Laboratories appreciates being of assistance to ESSO AUSTRALIA during the entire drilling operation of OPAH # 1 and look forward to our continuing association on future exploratory work in Australia.

Yours Sincerely

S.R. LA ROSA
(UNIT SUPERVISOR)

OPAH # 1 was drilled by ESSO AUSTRALIA in the Gippsland Basin of the Bass Strait. The exploration well was drilled by ODECO's semi-submersible drilling rig - Ocean Endeavour. The well was spudded in a water depth of 258' on 26 February 1977 and total depth of 8,205' was reached at 0514 hours on 11 March 1977.

Well location co-ordinates are:-

Latitude: 38° 31' 45.806" S.
Longitude: 148° 16' 42.205" E.

A Core Laboratories Extended Service fully integrated computer unit was located on board the Ocean Endeavour to monitor all drilling parameters below 20" casing depth. All computer data found within this report is stored on magnetic tape and can be retrieved at any time at the request of the client.

The Core Laboratories well-site crew consisted of:-

Unit Supervisor - Sal La Rosa
E.S. Engineer - Ingolf Hansen
E.S. Engineer - Michael Warner
Mud Loggers - Joseph Greener
 Ronald Wigham
 David Gilbert

RIG DESCRIPTION

The Ocean Endeavour is a self-propelled octagonal shaped semi-submersible drilling rig, constructed for Ocean Drilling & Exploration Company by Transfield (WA) Pty. Ltd., Perth, Western Australia.

The unit is 320' long, 266' wide with 7,000 HP twin screw diesel electric propulsion. The hull consists of four parallel pontoons, each measuring 28' in diameter. Four 12" diameter and eight 24" diameter stabilising columns are connected to the four pontoons. The tops of the columns which support the main deck of the rig are 120' from the base of the pontoons. The unit has capabilities of drilling at 70' draft in water depths up to 1,000'. The Ocean Endeavour is designed to withstand waves up to 110' with 15 seconds periods, simultaneously with 3 knot current and 100 knot winds and still remain within the American Bureau of Shipping allowable stress levels.

DESCRIPTION OF LOGS

Core Laboratories Extended Service Package includes sensors, recorders and computer facilities useful in the prediction and measurement of abnormal formation pressures and in obtaining rapid, effective and safe drilling. In addition to plots of variables important for pressure detection and drilling optimisation there are available wireline log interpretation programs for the wellsite geologist, well bore hydraulics (synthesis and analysis), well kill, bit nozzle selection, swab and surge created by drill pipe movement, drill bit performance programmes for the well-site drilling supervisors. As there are two computer systems on board, these programmes can be run while the main computer system is in the real-time drilling mode.

The E.S. Logs include the following:

E.S. Drill Log - Scale 1:6000

Information plotted on this log includes rate of penetration, 'd' exponent corrected for mud weights, total mud gas as measured by the hot wire detector, shale density of drilled cuttings, casing depth, bit runs, dates and other relevant drilling information. Both rate of penetration and total gas are plotted on a semi log scale and shale density on a linear scale. The 'd' exponent is the primary overpressure detection plot. Corrected 'd' exponent, 'dcs' is rate of penetration normalised for rotary speed, weight on bit per inch of diameter and mud weight. The modification of 'dcs' was first implemented by Rhem & McClendon, to compensate for increases in mud weight. This particular procedure involves multiplying the standard 'd' exponent value by the

inverse ratio of the mud weight increase. A multiplier of nine (9) was originally used for convenience to return the magnitude of the 'dcs' to a comparable value of its uncorrected state. In Core Lab's real-time drilling programmes a multiplier of ten (10) is used. An overlay is used on the 'dcs' to give a quantitative measurement of formation pore pressure. This method of pore pressure prediction is very accurate for homogenous shales but where the sandstone/siltstone ratio varies a great deal, inaccuracies may occur, consequently all other variables are considered in assigning a value to pore pressure.

E.S. Temperature Log

The three variables on the Core Laboratories E.S. temperature log are:-

1. Temperature differential between suction and flowline drilling fluids, is on the left of the E.S. log.
2. Flowline temperature is the middle plot.
3. The end to end normalised flowline temperature is on the right of the log.

The temperature differential plot or delta T plot emphasizes changes in flowline temperature caused by surface effects such as mud addition or cooling during trips. Accompanying the plot are notations identifying the causes for temperature irregularities. The flowline temperature plot illustrates the change in flowline temperature during a bit run. Each bit run is labelled and the temperatures are logged to correspond to mud circulated from the bottom as the foot was cut. There are also notations to explain accountable

variations. The end to end normalised flowline temperature plot is the principle interpretive plot. The information from the other two plots are taken into account, normalised and plotted as one continuous bit run. The flowline temperature is normalised for an annular velocity of 100 ft./minute and a hole of constant diameter. There is also a compensation for specific changes in temperature of the drilling fluid. This factor is obtained by the implications of changes in surface dissipation of heat. For example, if the flowline mud temperature at the surface is reduced by a stabilised 30°F. then chemicals are added to the mud system, the temperature of the same quantity of mud is reduced only 15°F. for the same initial flowline temperature and the same pit volume then the specific heat has changed by a factor of two. In this manner the correction for chemicals added can be accounted for from bit run to bit run as long as initial conditions are kept constant, including the same initial suction pit temperature at the start of the bit run. Along with this plot are temperatures from Schlumberger electric log runs, the time after circulation and depth. When two or more points are available, there is projected bottomhole temperature obtained using inverse time versus log temperature plots, when bottomhole temperature is the temperature corresponding to the logarithmic value at $1/\text{Time} = 0$.

E.S. Pressure Log

Information plotted on this log includes formation pore pressure, E.C.D. (equivalent circulating density) and formation fracture pressure. The formation pore pressure

plotted on this log is estimated from all formation pressure indicators. This is a conclusion log, therefore plotted data may well be modified on results from formation breakdown tests (PIT Tests), FIT's or DST's. The E.S. pressure log is the best estimation of downhole formation pressure conditions by the Core Lab well-site E.S. Engineer, based upon all relevant well data processed throughout the well drilling operations. This log is plotted on linear graph paper at a vertical scale of 1:6,000 to coincide with all other E.S. logs.

E.S. Geoplot 1

This log includes rate of penetration, corrected 'd' exponent, drilling correlative porosity, formation fracture pressure, pore pressure and equivalent circulating density. It is plotted by the computer, either during the actual drilling of the hole or after TD, from the drilling data stored on magnetic tape. Once again this log is plotted on a 1:6,000 vertical scale. The horizontal dashed lines indicate the initiation of a new bit run.

E.S. Geoplot 2

This log is similar to the Geoplot 1 in that it is computer plotted. However the following variables are plotted:- weight on bit, rotary speed, pump pressure and mud density in.

HP Quartz Pressure Gauge

This highly accurate bottomhole pressure gauge is used in conjunction with the Schlumberger F.I.T. tool. The Hewlett

Packard Quartz Pressure Guage measures well bore pressure with a resolution of 0.01 psi over a dynamic range in excess of 10,000 psi. This capability makes it possible to accurately measure pressure changes that cannot be detected with conventional gauges using bourdon tube transducers.

WELL LOG PARAMETERS

1. Grapholog

Scale 1:400, containing drilling rate, hot wire total gas, chromatographic analysis, percentage strip lithology, lithology descriptions and remarks column, casing points, individual bit runs, dates, mud data, deviation surveys and core descriptions.

2. E.S. Drill Log

Scale 1:6,000, containing rate of penetration, hot wire total gas, corrected 'd' exponent, shale density, bit runs, dates and casing points.

3. E.S. Temperature Log

Scale 1:6,000, containing flowline temperature, ΔT :- flowline temperature minus suction temperature, end to end plot (dimensionless).

4. E.S. Pressure Log

Scale 1:6,000, containing formation pore pressure, equivalent circulating density, formation fracture gradient.

5. E.S. Geoplot 1

Scale 1:6,000, containing rate of penetration, corrected 'd' exponent, drilling porosity, formation pore pressure, equivalent circulating density and formation fracture gradient.

6. E.S. Geoplot 2

Scale 1:6,000, containing weight on bit, rotary RPM, mud density in and pump pressure.

OPAH # 1 WELL SUMMARY

OPAH # 1 was spudded on 26 February 1977, with 20" casing being set at a depth of 761'. Drilling fluid used for the surface hole was sea-water, with all returns to the sea-floor. As was noted on the previous well drilled in this area, SWORDFISH # 1, surface hole drilling attained high penetration rates and corresponding high drilling porosity which are indicative of extrusive drilling; that is drilling by jet abrasion rather than conventional drilling by cutting action of the bit teeth. The lithology throughout the surface section, to an approximate depth of 2,200', was a calcareous soft to firm siltstone, with traces of carbonaceous material, glauconite and pyrite occasionally, also with abundant skeletal fragments throughout the section. From 2,200' to the programmed 13.375" casing point of 2,912', the lithology varied to a calcarenite, firming up at the base of the section. As noted, the formation became slightly more compacted and as seen on the plots, gradually established the drilling porosity and 'd' exponent trends. Absence of drilling problems, low

background gas, no connection gas, all these factors indicate a normal pore pressure gradient over this interval. After drilling to 2,912' the following Wireline Logs were run: ISF-Sonic, FDC, Gamma Ray. Due to the absence of clean competent shales over the logged interval, no pressure predictions from the Wireline Log data were performed.

13.375" casing was set at 2,861' in a firm calcarenite, providing a good casing seat. On drilling through the casing shoe no actual PIT was run, thus preventing obtaining an accurate measurement of the formation fracture pressure for OPAH # 1. Over the section 2,912' to 5,600', few hole problems were experienced, mainly due to the fact that good drilling practices were maintained by optimizing Impact Force, Jet Velocity and available Horsepower. Lithologies encountered over this interval being calcarenite and calcilutite, giving a reasonably good trend line, with a definite lateral shift at 4,875'. This shift in trend line could possibly indicate an abnormal pressure zone. But at this particular point of the well operation no other monitored parameters, such as increasing background gas, non-existent connection gas or hole sloughing indicated that possibility. But these tell-tale factors could well be masked by the more than adequate over-balance being maintained. A second possibility exists. The correction of 'd' exponent for mud weight in use is an empirical one, but quite adequate where the over-balance of a mud system is minor. A given increase in over-balance has less effect on rate of pene-

tration when a substantial over-balance exists, but the 'd' exponent correction assumes the same effect, the 'd' exponent then tends to be over-corrected and this over-correction increases with increasing over-balance, that is, for a constant mud weight, with increasing depth. This can produce a vertical or near vertical trend line. Again, an increasing silt content of lithologies encountered, would tend to straighten the trend line. Mud samples from the desilter over this interval indicated a higher percentage of silt in the formation than was actually apparent from samples taken over the shale shaker screens.

At approximately 6,420' a pump pressure increase was noted, associated with lower pump strokes and partial mud returns, indicating a possible 'packing-off' in the soft clay formation. After circulating the hole and a trip for a new bit drilling resumed, only to 'pack-off' once again at 7,645'. The hole was again circulated clean, conditioned and drilling continued after a trip for a new bit, with no further major hole problems.

At 7,911', the first major objective was encountered, a sandstone with loose medium to coarse quartz grains, with no visual fluorescence, but only a strong white cut was noted. Gas composition recorded for this first break was good but suggests that the zone would probably be non-productive. Two more drilling breaks were circulated out before reaching total depth of 8,205'. The two breaks were at 7,989' and 8,016'. Once again both breaks proved to be very poor with no shows recorded.

Hydrocarbons noted on the grapholog at intervals 8,050' - 8,100' and 8,140' - 8,160' could possibly be attributed to re-circulated gas from the upper gas bearing sand body. The following should also be noted about the gas readings recorded on OPAH # 1 in the lower section of the hole. Generally one Hot Wire unit is equivalent to 500 parts per million methane in air. With the presence of ethane, propane, butane, pentane, and hexane, the Hot Wire can no longer be used quantitatively, because the catalytic combustion detector element is sensitive in varying degrees to the carbon number of the hydrocarbon atoms present and is looking at all gaseous components simultaneously and not individually as in the case of the chromatograph. Some divergence between Hot Wire and Chromatograph can therefore be expected where a high proportion of "heavies" occurs.

On reaching total depth of 8,205', Wireline Logs were run, thereafter seven (7) Schlumberger F.I.T./Hewlett-Packard Quartz Pressure Gauge pressure tests were performed on the formation at varying depths. The final test, taken at a depth of 8,123' produced an equivalent formation pore pressure of 8.2 ppg representing the drawn-down pressure produced by the surrounding reservoir fields.

As can be seen from all data obtained, processed and analysed, our opinion is that OPAH # 1 was normally pressured throughout.

DUMP A

DEPTH	-	Well depth in feet
TIME	-	Time of day in hours and minutes
ROP	-	Rate of penetration in feet per hour
WOB	-	Weight on bit in thousands of pounds
RPM	-	Rotary speed in revolution per minute
MID	-	Mud density in, in pounds per gallon
MDO	-	Mud density out, in pounds per gallon
ECD	-	Equivalent circulating density of the drilling fluid at the bottom of the hole. The sum of the hydrostatic pressure and the annular pressure drop, measured in pounds per gallon
PP	-	Pore pressure gradient, in pounds per gallon, is the pressure exerted by the fluids in the pore space of the formation. It is determined by analysing deviations from the trend line of the drilling porosity.
FG	-	Fracture gradient is the pressure required to fracture the formation, expressed in pounds per gallon. It is derived from the pore pressure, calculated by the program using the Matthews and Kelly equation and an appropriate matrix stress curve
POR	-	Drilling porosity. This is the calculated porosity of the formation being drilled, derived from the general drilling equation. It is a function of the drilling variables: WOB, ROP, RPM, Toothwear, differential pressure and rock strength
DEXP	-	Calculated 'd' exponent. The 'd' exponent is a function of WOB, ROP, RPM and hole size. A correction is made to the 'd' exponent for variations in mud density to give the corrected 'd' exponent

DUMP B

- RS - Calculated rock matrix strength. A dimensionless number derived from previous field data which relates to the strength of the rock.
- MTI - The mud temperature in, in degrees farenheit
- MTO - Mud temperature out, in degrees farenheit
- MRO - The mud resistivity out, in ohm-metres
- YPM - The yield point of the mud in lbs/100 sq. ft.
- PVM - The Plastic viscosity of the mud in centipoise
- MVI - The mud flow rate in gallons per minute, computed from the pump rate and pump output
- MDOV - The mud density override setting

DUMP C

- DEPTH - Well depth in feet
- STEP - Depth increment in feet
- CHRS - Cumulative bit hours. The number of hours that the bit has actually been 'on bottom' as opposed to in the hole, recorded in decimal hours
- WOB - Weight on bit in thousands of pounds
- HKLDX - Maximum hookload. This is the total weight of the string. The value for maximum hookload picked up by the computer is the average value of the total weight of the string over a 5 second interval beginning after the rotary table has made five revolutions after the slips have been pulled. This value is then fixed in the computer memory until the next time the slips are set, when a new value is taken.
- HKLD - Current hookload. This is the weight of the string when 'on bottom' i.e. whilst actually drilling. The difference between the maximum hookload is the computer calculated weight on bit.
- BWOV - The weight on the bit override setting. This is used in the event of a hookload sensor malfunction to enable the operator to inform the computer of the WOB in use.
- SPM1 - Stroke rate/minute for pump number 1
- SPM2 - Stroke rate/minute for pump number 2
- PMPR - The pump pressure, psi
- PCSG - Casing pressure. This is the pressure exerted on the casing after the well has been shut in following a 'kick'.
- HSP - Hydrostatic pressure. This is the pressure exerted by the column of mud in the hole, measured in psi.

PE603567

This is an enclosure indicator page.
The enclosure PE603567 is enclosed within the
container PE906230 at this location in this
document.

The enclosure PE603567 has the following characteristics:

- ITEM_BARCODE = PE603567
- CONTAINER_BARCODE = PE906230
 - NAME = ES Drill Log
 - BASIN = GIPPSLAND
 - PERMIT = VIC/L5
 - TYPE = WELL
 - SUBTYPE = MUD_LOG
- DESCRIPTION = ES Drill Log for Opah-1 containing Rate
of Penetration, Corrected 'd' Exponent
and Gas units
- REMARKS =
- DATE_CREATED = 20/04/77
- DATE_RECEIVED =
- W_NO = W687
- WELL_NAME = OPAH-1
- CONTRACTOR = CORE LABORATORIES AUSTRALIA LTD
- CLIENT_OP_CO = ESSO AUSTRALIA LIMITED

PE603568

This is an enclosure indicator page.
The enclosure PE603568 is enclosed within the
container PE906230 at this location in this
document.

The enclosure PE603568 has the following characteristics:

ITEM_BARCODE = PE603568
CONTAINER_BARCODE = PE906230
NAME = Geoplot Log 1
BASIN = GIPPSLAND
PERMIT = VIC/L5
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Geoplot (1 of 2) for Opah-1 containing
porosity and pore pressure data
REMARKS =
DATE_CREATED = 20/04/77

PE603569

This is an enclosure indicator page.
The enclosure PE603569 is enclosed within the
container PE906230 at this location in this
document.

The enclosure PE603569 has the following characteristics:

- ITEM_BARCODE = PE603569
- CONTAINER_BARCODE = PE906230
- NAME = Geoplot Log 2
- BASIN = GIPPSLAND
- PERMIT = VIC/L5
- TYPE = WELL
- SUBTYPE = WELL_LOG
- DESCRIPTION = Geoplot (2 of 2) for Opah-1 containing
Rotary RPM, Pump Pressure and Mud
Weight data
- REMARKS =
