Log Evaluation

INTRODUCTION:

The well Spermwhale 1 was drilled in permit Vic/P-11 in the Gippsland Basin, to evaluate the hydrocarbon potential in the Latrobe and Strzelecki groups.

The Latrobe group was logged between about 800 and 950 m; the uppermost 40 metres of this interval are hydrocarbon bearing.

The Strzelecki below about 950 metres was found to be water bearing.

The pay zone contain predominantly gas, with a small oil leg of less than five metres.

Lithological Units

no	interval	
1	804,5 - 809,5	claystone
2	809,5 - 813,5	sandstone
	813,5 - 818,5	silty claystone, probably containing a coal band near the base

2	818,5 - 845,0	alternating sand and silty claystone
	845,0 - 851,5	predominantly silt/claystone; 2 or 3 minor coal streaks near base
	857,5 - 925,5	mainly sand and siltstones, alternating with zones of higher clay content, associated with minor coal streaks,
	925,5 - 947,0	probably sand/siltstone
	below 947,0	silt/claystones; probably increasing carbonate cement.

All depth statements refer to log depth measured from derrick floor at 9.4 metres above sea level.

Discussion of the Results
- and the method of Interpretation:

The zones containing producable hydrocarbons are:

interval	gross	net	mean ϕ	mean Sw	type
m	m	m	%	0	
809,5-813.5	4,0	4.0	31	8	gas
818.5-830.0	11.5	10.0	26	14	gas
831.5-833.5	2.0	2.0	28	31	oil

It is quite likely, that residual oil exists down to about 870 metres; some cautious judgement is required because the here presented interpretation is not corrected for coal. The large porosities and apparent low water saturations at 818, 835, 854 and 856, 880 and 882, 895, 916 metres are due to coal beds.

The presence of oil at 832 metres has been deduced from the neutron response mainly; it has been proven by wireline formation tests.

The resistivity of the formation water has been derived from log as 0.64 ohmmetres at 110 degrees Fahrenheit. Comparing with the water salinities of the test samples, this could be regarded to be slightly too high, but only minor contamination with the saline mud filtrate leads to large distorsions of this value.

The interpretation was computed with the Realog program, using its matrix method. The contact water content was calculated as percentage of the apparent clay content.

NOTE to SONIC INTERPRETATION

Since quite some time (start in 1974; BOCAL) I am testing alternate equations relating sonic transit time to porosity. These equations deviate from the time average equation

$$t = \phi * t_f + (1 - \phi) * t_{gr}$$

The best match to core data was given by the weighted geometrical average of the compressibility K of fluids and solids involved.

$$\ln(K_b) = \phi * \ln(K_f) + (1 - \phi) * \ln(K_{gr})$$

in its simplest form.

The compressibility is defined by

$$v^2 * \rho = K + 4 * G / 3$$

or

$$\rho / t^2 = 3 * K * (1 - c) / (1 + c).$$

The constant c, being Poisson's constant, can be determined by the analysis of sonograms and the determination of the shear velocity $v_s^2 * \rho = G$. Studies of appropriate well data lead to the conclusion that the term $3(1-c)/(1+c)$ and its effect on the compressibility/porosity equation can be derived from crossplots. It represents principally a compaction correction.

Incorporated into the first equation above, one obtains

$$\ln(K_b) = c1 * \phi * \ln(K_f) + c2 * (1 - \phi) * \ln(K_{gr})$$

- 2 -

or $\ln(K_b) = a + b * \phi$.

In 1980, Schlumberger published their triplet of new Sonic/Porosity transforms (see enclosure). The above sketched method was checked against most reference data and the transforms of Schlumberger and were found to agree with the Schlumberger results.

Because of its simplicity, its physical meaning and its easier application, the above equation is now implemented into our programme REALOG for general use.

This method has been part of the here presented interpretation. In crossplots, the new log parameter ρ_0/t^2 is named BULK MOD for bulk modulus or the inverse value of compressibility.

PE604612

This is an enclosure indicator page.
The enclosure PE604612 is enclosed within the
container PE904241 at this location in this
document.

The enclosure PE604612 has the following characteristics:

ITEM_BARCODE = PE604612
CONTAINER_BARCODE = PE904241
NAME = Volume Percentage Plot, 2 of 4
BASIN = GIPPSLAND
PERMIT = VIC/P11
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Volume Percentage Plot, 2 of 4, Sperm
Whale-1
REMARKS =
DATE_CREATED = 5/07/82
DATE_RECEIVED = 14/04/83
W_NO = W762
WELL_NAME = SPERM WHALE-1
CONTRACTOR = PETRODATA AG

This is an enclosure indicator page.
The enclosure PE604613 is enclosed within the
container PE904241 at this location in this
document.

The enclosure PE604613 has the following characteristics:

ITEM_BARCODE = PE604613
CONTAINER_BARCODE = PE904241
NAME = Volume Percentage Plot, 3 of 4
BASIN = GIPPSLAND
PERMIT = VIC/P11
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Volume Percentage Plot, 3 of 4, Sperm
