# EXTRACT FROM THE MINES (PETROLEUM) ACT 1935, AS AMENDED BY THE MINES (PETROLEUM) ACT 1939.

Section 19.—(1) The holder of a licence shall employ in drilling operations only such methods of drilling as are capable of yielding a core or other samples as is or are prescribed or is or are approved by the Minister.

- (2) In the event of water associated with a petroleum deposit being encountered in the course of drilling operations, the holder of the licence shall immediately report the same in writing to the Minister and state the steps taken to deal with it.
- (3) In the event of the continuance of drilling operations after water has been encountered as aforesaid, the holder of the licence shall shut off all water so encountered and take such other steps as may be prescribed.
- (4) In the event of traces of petroleum, including natural gas, appearing during drilling operations, the holder of the licence shall immediately report the same to the Minister, and shall carry out such operations to test the extent and value of the occurrence of such petroleum as the Minister by notice in writing directs.
- (5) In the event of preliminary tests indicating the probability of payable petroleum, the holder of the licence shall—
  - (a) immediately report thereon to the Minister in writing; and
  - (b) carry out thereafter such operations as may be necessary to test the value of the occurrence of such petroleum as may be approved by the Minister.

Section 45.—Every licensee and lessee shall keep a log, in the form prescribed by the Minister, of all the wells drilled by him showing the strata and character of the ground passed through by the drill, which log or a copy thereof shall from time to time be furnished to the Minister upon demand.

Section 48.—Every licensee and every lessee, unless in any case wholly or partially excused from so doing by the Minister, shall properly case each well with casing in accordance with the best approved methods, landing and effectually cementing one or more strings of the casing in clay or other water-impervious strata or formation between all water-bearing sands or strata and any underlying petroleum deposit, and generally shall take all such steps as are reasonably necessary for effectually shutting off all water overlying and underlying the petroleum deposits, and for effectually preventing any water from penetrating such petroleum deposits.

# EXTRACT FROM THE MINES (PETROLEUM) ACT 1939.

Section 7 (6).—Every licensee shall—

(a) retain for a period of not less than twelve months all cores obtained by drilling and representative samples of other specimens obtained from the land . . . . and, when so required by the Minister, forward the same to the Minister.

tight brown-grey clay, with minor coal beds. 3780 - 3840 : 3840 - 3910 gravelly sand. 3910 - 3935 : grey mudotine, etc. 3935 —

The majority of these beels, if not all belong to equivalents of the Bushy Park Beds. It is very difficult to say whether or not the marine facios (represented by samples from 280 to 340ft) is a Jemmys Pt. Formation equivalent. It descript is definitely either Kalimian or younger. Microfaunas include Ammonia beccarii, and Elphidum discoidale, also miliolido — all typical shellow water species. Traces of Nonion victoriense appear also, while pelagico (Globigerina sp.) are rare. The facina here also contains molluscan fragmento, ostracodo, and rare echinoid spines.

740-1010 feet: Jemmy's Pt. Tambo River Formation.

Marine leeds below 740 ft. contain the highest occurrences
of Ditrupa slargeozoa (typically Cellaria sp.) are typical of the
youngest marine beds in the areas to the east (Seaspray, Well. Pk\_etc). Ammonia beccavii is not recognised, but Nomioni victoriense is quite common together with Astronomion australe, Cancris auriculus, Cibicides eygnorum, Elphidumi spp — including E. imperatrix & E. pseudonodosum, Gruttulina regina, Valvulineria kaliminensis, also miliolido + lagenido. Pelagico (eg. G. bulloides gp.) are rare. Remains of mollusca, ostracodo sedinicido are noted, Between 910 and 1050 feet, a poor microfauna contamo Elphidum spp. — including E-parri, Nomion victoriense, Notorotalia Clathrata and lageneds. Mollusca, Ditrupa and bryozoa occur also, but none of them are common. This interval could tentatively be referred to as the Tambo River Formation, and that above the Jemmy's Point Formation 1010 - 2330 feet: Gippsland Limestone.

De approximate subdivision is as follows: 1010 — 1675 ft. : Bairnsdalian Balcombian. The sandy limestones and calcareous sands contain limited Pricuofarmas which are rather worn. Operculina victoriensis Elphiduin pari occurs also. Amphistequia lessonii was recorded in a cores at \$ 1330-48 ft a 1405 ft, best does not become common until below the latter. 1675 - 1715 ft. : Bates fordiani. Samples contain <u>Lepidocyclina howchini</u>, common <u>Amphistegina</u> lessonii, minoi Oporculina victoriensis, and occasional Globigarinoides bispherica and Globigerina bulloides go.

The Lepidocycline beds are thus particularly restricted here. The microfaunas in this interval contain Astronomian centroplax (ibricides perforetus, and limited pelagics, slightly more common towards the base - which include Globigerina apertura + G. woodi

2330 - 2577 feet: Lakes Entrance Formation. Microfunas in the upper puggy marks represent F.U.S., and consist of include Elphidum crespinae, Gyroidina zedandia, and Globigerina ampliapertura enapertura.

The basal cores of mark, which are closely associated with the underlying coal measures, contain F.U.4 species — Globigerina ampliagentura ampliapentura as well as G. ampl. enapentura, Globigenna linapenta (or G. of inapenta), Globorotalia testarigosa, Spirobolivina emmenderfesi (syn. <u>Bolwina crespinse</u>) etc. 1577 — 3935 feet: Latrobe Valley Coal Measures
The whole seguence appear to be non-marine The interval from 2579 to 3505 ft. represents the Upper Latrobe Valley (M. From 3505 to 3780ft is the Thorpdale Volcanics, and from 3780 to 3935 ft the Childers Finn, with of the Laver Latrobe Valley CM. Below 3935 feet: Strozdecki Group. A non-marine sequence of Mesozoic age. CHARACTERISTICS OF THE LAKES ENTRANCE FORMATION. The top of the formation was picked on: is lithology ii microfaunas although the definition was not outstanding in any of them. therefoliated trade more crystallie ments; contain grains of quartz and of glanconite. These mans (or marly inestones) are softer and more clayey towards the top, the glauconite content is vather low. The mask' become more crystalline (and probably dolomitic) howawards of the glauconite content increases as does the quarty content.

At approx. 2480 feet there appears a narrow bed on the e-log which corresponds to a sample containing a very high proportion of coarse quarty sand, many of the grains having a greenish tings

                                Fetroliferous Core.-
Top: Brown-stained, strongly oil smelling petroliferous marl. The marl is green, very glauconitic but with no permeability and low porosity. Biffuse oil stains. Bottom: Core displays contact of marine, oil stained and glauconitic marl above, and brown coal below. The contact shows the marl penetrating downward into a system of sun-cracked
2555-2577.
                                ting downward into a system of sun-cracked
                                crevices in the coal which the marl fills.
                                This contact denotes exposure of coal prior
                                to marine transgression.
```

Below this level a <u>lag</u> becomes apparent between screen sample depths as indicated by drilling pipe lengths and depths as witnessed by the electric log. From 5 feet, this lag progressively increases with depth to over 35 feet.

Drill pipe figures continue to be shown in the left column . Where possible, corrections to true depth are given in the right-hand column and intermediate depths should be corrected accordingly from these figures.

(5995) (6000) **4**600**8)** FINIS. Mudstone and shale. Occ. fine-gr. sandstone and some coal.

As above. Some fertiary contamination. Mostly mudstone and claystone. As above. Occ. sostone chips.

As above.

50/50 mmtome & fine-gr. sandstone. As above. Slight contamination. Slump material: Tertiary recks.

Core. -Top: Mudstone and shale with calcite--filledoracks, slickensided along the cracks. Carbonaceous streaks about a inch thick. Dip: 25-30.

Middle: Medium -grained arkosic adst.
Bottom: As above with scattered coal.
Med.-gr. feldsp. sdst. with some mudst.
contaminated with Tertiary rocks.
Med.-gr.sdst. contaminated as above.
Mudstone, edstone and black coal.

As above.

As above, sandstone predominating. Coarse sandstone. One lump mudetone. As above. Occ. mudstone and black coal. Core.-

Top: Fine-grained carbonaceous mudst., Dip: 20°-25°-30°, streaks of earb. matter, cracked, slickensided, conjugate cracks filled with pinkcalcite.

Middle: As above, faulted slickeneided in the extreme.

Bottom: Fine-grained carbonacetts sand stone & mudstone. with irregular streaks of black coal . Dip:25°. Fault hades at 60°dip.

Mudetone with occasional sandstone. Much faulted in a conjugate calcite--filled pattern. Carbonaceous matter. Hard Jurassie mudatone.

A - - Land Dacons of the Control

As above.

Hard Mudstone as above, with much calcit fault-filling material. Continuation of the fault-zone. Extremely shattered rock chips.

Core descriptions by Well-sim Geologist-P.W.Bollen. Woodside No.1

Cores of Jurassic 'Arkose' section.

4098'-4108'

Top; 2'5" Gray med-coarse grained arkose with occaisional inclusions of quartz grit.

611 Calcareous arkose, medium-coarse grained.

21 Gray, med-coarse grained arkose.

4915'-4933'

Top.

71 Coarse to medium grained gray-greenish arkose with occaisional bands and strands of coal, scattered mud

pellets, grit size pieces of quartz scattered irregularly. Arkose as above with bands of calcite at angle of 60 degrees to diameter of core, quartz grit present. Arkose as at top of core

319"

5769'-5779'

Top. 13"

Gray siltstone with specks of coal.

6" Gray arkose, med-coarse grained with calcite at angle of 60 degrees to diam of core.

Gray med-coarse grained arkose occaisional bands of calcite & fwe specks of coal. 616"

5950'-5955'

Top.

51 Laminated siltstone ans shale with specks of coal and some bands of coal, calcite veins at angle of 50 degrees to diam of core and slickensided at same angle.

# OIL AND GAS OCCURRENCES IN WOODSIDE NO. 1 and 2 WELLS

The following data was obtained from lithologic logs and drilling reports of the Woodside wells. Oil and gas shows indicated on drilling reports are labelled "D.R".

Description of Show

# WOODSIDE NO. 1.

Depth

Depth	Description of Show
1002 7	Slight gas indication (D.R.)
2539°	Gas indication. Petroliferous odour (D.R.
2556 ° - 2577 °	Diffuse oil stains in marl. Marl, green, very glauconitic, no permeability and low porosity, oil smell. Immediately over-lies Latrobe Valley Coal Measures
36501	Gas Show (D.R.)
3720 * - 3728 *	Oil Show? (D.R.)
≈ 44 <b>3</b> 0°	Arkose and mudstone, strongly smelling of crude petroleum. Dark yellow chloroform reaction.
5830°	Oil show in mud stream. No Gas (D.R.)
WOODSIDE NO. 2.	
980' - 1000'	Gas Show and slight show of oil (D.R.)
1310' - 1500'	Oil show reported in this interval (D.R.)
1310' - 1350'	Oil show in sandy marl. Sandy marl, cream coloured, stained brown, containing large quartz grains. Foraminifera, scaphopods and Ditrupa. Oil described in Chemical Laboratory Report 50/52 - 56 of 10/2/56.
1966' - 1980'	Top of core showed brown oil sand (D.R.)
2493° - 2511°	Indications of oil in top section of core $(D_{\bullet}R_{\bullet})$
3104 1	After drilling through coal series mud became saturated with oil and coal and showed considerable gas constantly (D.R.)
31 <b>7</b> 0°	Large flow of gas encountered with colour in mudstream (D.R.)
49621	Positive chloroform test.
5022' - 5032'	Gas Show (D.R.)
5120' - 5290'	Light oil and paraffin in samples (D.R.)
5235° - 5266°	Gas Show (D.R.)
5351° - 5600°	Gas and oil show in mudstream continuous $(D_*R_*)$
5600° (5635-5640 Boutak.)	Strongly stained sample with free viscous green oil strongly smelling of crude petroleum. Sample 70% arkose, 30% shaly mudstone with a few 1 bands of black coal. Chemical analysis of hydrocarbon in Chemical Laboratory Report 271/272/56 of 6/4/56.
6067 - 6088	Oil sand (D.R.)

# PERFORATION TESTS - WOODSIDE NO. 2.

Perforation tests were carried out by Lane Wells Ltd. with negative results. Well beds cased to 6104° with  $6\frac{5}{8}$ " Casing.

# TEST 1.

Perforated interval 1310° - 1345°. Plug set at 1428° Packer set at 1305°. Test first gave mud moxed with water, then 6lightly brackish water and finally freshwater.

# TEST 2.

Perforated interval 5582' - 5618'. Plug set at 5657' Packer set at 5570'. Nothing recovered from formation.

Reports on Oil Samples (Chemical Lab. Reports)

Samples 50 - 52/56 of 10/2/56

Oil from the 1310 - 1350 level in Woodside Well No. 2. Dark brown to black crude oil of S.G. 0.92 - 0.93. This oil is described as a heavy crude oil free from gasoline, kerosine and other light fractions of a mixed paraffinic asphaltic base.

# Samples 271 - 272/56 of 6/4/56

Oil from 5635' - 5640' level in Woodside Well No. 2. This oil is described as a crude oil which in the 5640 level contains approximately 20% of light, low boiling point fractions of mixed paraggin - asphalt base, is of softening point 40 - 50° c and contains some sulphur.
