

FIGURE 2a: 1814.5 m  
Crossed Nicols (1 mm). Quartz grains embedded in single crystal of carbonate (speckled buff colour) which locally occludes all porosity. A corroded muscovite flake (centre, bright colours) is also shown.

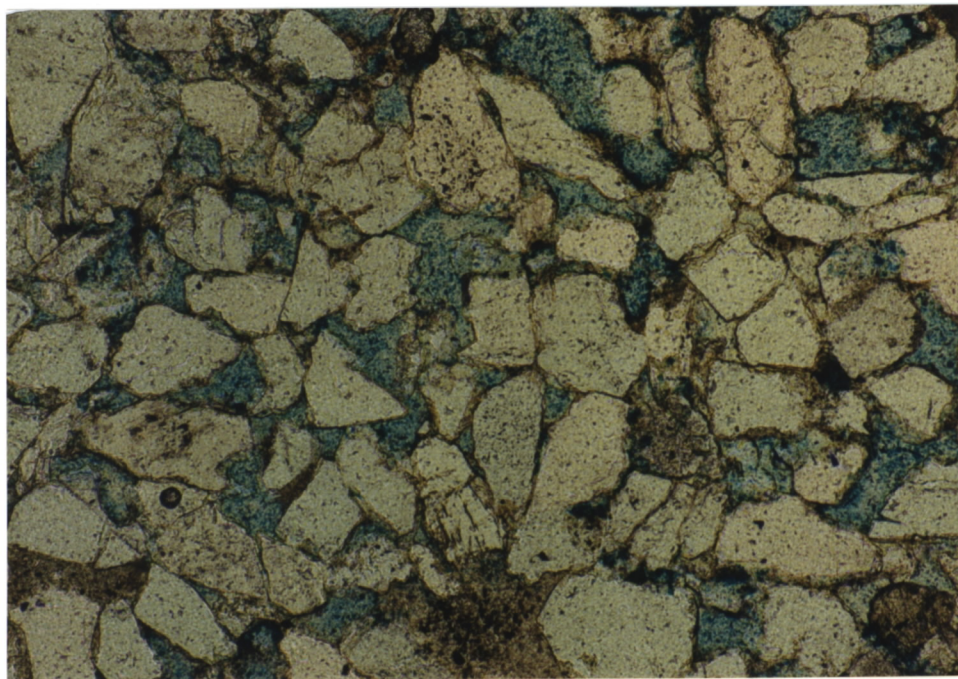

FIGURE 2b: 1814.5 m  
Plane polarised light (2 mm). Typical view. Blue-stained pores are abundant. A little brown clay is present in patches and as a film on some grains.
