BIOSTRATIGRAPHY

TABLE-1: INTERPRETATIVE DATA

TABLE-2: ANOMALOUS AND UNUSUAL OCCURRENCES OF SPORE POLLEN

PALYNOLGY DATA SHEET

TABLE-3: BASIC DATA

INTRODUCTION

Nineteen sidewall cores samples and three conventional core samples were processed and analysed for spore-pollen and dinoflagellates. Although recovery and preservation were adequate throughout, relatively few samples contained zone indicator species. Consequently many age determinations are of low confidence.

Lithological units and palynological zones from the base of the Lakes Entrance Formation to T.D. are summarized below. Anomalous and unusual occurrences of taxa are listed in Table 2. Basic data are given in Table 3.

SUMMARY

AGE	UNIT	ZONE	DEPTH (m)
Early Oligocene -Early Miocene	Lakes Entrance Formation	<u>P. tuberculatus</u>	1111.5
log break at 1119.0m			
Late Eocene	Unnamed marl	Upper <u>N. asperus</u>	1119.2-1126.2
log break at 1137.0m			
Late Eocene	Gurnard Formation equivalent	Middle <u>N. asperus</u>	1142.0
log break at 1144.25m			
Late Eocene	Latrobe Group coarse clastics	Middle <u>N. asperus</u> Lower <u>N. asperus</u>	1168.3 1175.0-1299.0
T.D. 1321m			

GEOLOGICAL COMMENTS

1. The Perch-2 well contains a continuous sequence of zones from the Middle Eocene, Lower N. asperus Zone to the Early Oligocene, P. tuberculatus Zone.
2. A highly calcareous siltstone dated as Upper N. asperus Zone occurs near the base of the Lakes Entrance Formation (SWC 26, 1119.2m). Sediments at 1125.2m, above Top of Latrobe picked on logs as occurring at 1137.0m, are also calcareous and Upper N. asperus Zone in age. Glauconite is rare. Log data indicate both samples are part of the same unit, extending from 1137.0m to 1119.0m. Essentially the same sequence of Upper N. asperus Zone facies extends across the picked Top of Latrobe in Palmer-1 and may be present in the unsampled interval above 3750 ft in Perch-1 (see Stacy 1982). The Upper N. asperus Zone calcareous shale unit in Perch-2, cited here as an unnamed marl, may be the equivalent of the glauconite-free marl occurring between 6700 and 6820 ft in Bullseye-1.
3. The unnamed marl is underlain by a non-calcareous siltstone, defined by the gamma ray spike between 1137.0 and 1144.5m. This siltstone which contains rare glauconite but abundant fine pyrite, is Middle N. asperus Zone in age and is likely to be the time equivalent of the Gurnard Formation in adjacent wells. The absence of moderate to abundant pelletal glauconite in Perch-2 is in marked contrast to Palmer-1, where a 27m thick greensand of Middle N. asperus zone age is recorded (Stacy ibid). Greensands are also present in the top section of a core taken in Perch-1 (3720-3722.5 ft, 1133.9-1134.6m). The actual thickness of greensands in this well (Perch-1) is unknown but possibly up to 31m given that the Top of Latrobe picked on logs is at 1103.5m. Removal by erosion of a greensand of this thickness at Perch-2 is considered highly unlikely and a more realistic explanation is that a thin greensand, associated with a marked gamma kick between 1128.5 and 1134.5m in Perch-1, is either absent or, less likely, was not sampled in the equivalent unit between 1140 and 1144.5m in Perch-2.

BIOSTRATIGRAPHY

Zone boundaries have been established using the criteria of Stover and Partridge (1973) and subsequent proprietary revisions.

Lower Nothofagidites asperus Zone: 1175.0m - 1299.0m.

The base of the zone is provisionally picked at 1299.0m on the occurrence of the rare species Proteacidites reflexus. The sample concerned is a coal containing a Phyllocladidites mawsonii-Proteacidites-Clavifera triplex palynoflora. The coal at 1295m contains a Nothofagidites-dominated palynoflora in which Clavifera triplex and Proteacidites recavus are frequent. A more reliable lower boundary for the zone is at 1278.0m, a sample containing frequent Proteacidites asperopolus and Nothofagidites. Tricolporites leuros, which usually first appears in this zone, is present at 1256.2m. The upper boundary is picked at 1175.0m, the highest sample lacking species diagnostic or typical of the Middle N. asperus Zone. Nothofagidites falcatus shows this sample is no older than Lower N. asperus Zone in age.

Middle Nothofagidites asperus Zone: 1142.0-1168.3m.

This interval is characterised by assemblages containing only the general N. asperus Zone indicators, e.g. frequent to abundant Nothofagidites spp. The base of the zone is provisionally picked at 1168.3m, a sample containing abundant Vozzhenikovia extensa. The upper boundary is defined by the only occurrence of the zone indicator species Triorites magnificus in this well.

Upper Nothofagidites asperus Zone: 1119.2-1126.2m.

Two samples are assigned to this zone on the absence of indicator species of the Middle N. asperus Zone or the P. tuberculatus Zone. Although the majority of the dinoflagellates could not be identified, the assemblages resemble those recorded elsewhere in latest Eocene - Early Oligocene sediments. The sample at 1126.2m contains Stereisporites punctatus, a spore which is last recorded in this zone, and Proteacidites tuberculatus a species which first appears in the uppermost Middle N. asperus Zone. Other species which also first appear in the uppermost Middle N. asperus Zone are present at 1119.2m - Proteacidites rectomarginis and Verrucosiporites cristatus. An occurrence of the very rare species, Proteacidites truncatus in this sample extends the known range of the species from the Middle Miocene, I. bellus Zone to the Upper N. asperus Zone in the Gippsland Basin. P. truncatus occurs in Middle N. asperus Zone sediments in the Bass Basin.

Proteacidites tuberculatus Zone: 1111.5m.

Occurrence of Cyatheacidites annulatus and Protoellipsodinium simplex confirm a P. tuberculatus zone age for this sample J-1 Zone foraminifera demonstrate that this sample is Early Oligocene (M.J. Hannah pers. comm.).

- CONFIDENCE
RATING:
- O: SWC or Core, Excellent Confidence, assemblage with zone species of spores, pollen and microplankton.
 - 1: SWC or Core, Good Confidence, assemblage with zone species of spores and pollen or microplankton.
 - 2: SWC or Core, Poor Confidence, assemblage with non-diagnostic spores, pollen and/or microplankton.
 - 3: Cuttings, Fair Confidence, assemblage with zone species of either spores and pollen or microplankton, or both.
 - 4: Cuttings, No Confidence, assemblage with non-diagnostic spores, pollen and/or microplankton.

NOTE: If an entry is given a 3 or 4 confidence rating, an alternative depth with a better confidence rating should be entered, if possible. If a sample cannot be assigned to one particular zone, then no entry should be made, unless a range of zones is given where the highest possible limit will appear in one zone and the lowest possible limit in another.

SWC 4	1295.0	Lower N. asperus (2)	<u>Proteacidites recavus</u>	Frequent in palynoflora.
SWC 4	1295.0	Lower N. asperus (2)	<u>Phyllocladidites palaeogenicus</u>	In coal palynoflora dominated by <u>Nothofagidites</u>
SWC 4	1295.0	Lower N. asperus (2)	<u>Tetracolporites</u> cf <u>textus</u>	In coal palynoflora dominated by <u>Nothofagidites</u>
SWC 3	1299.0	(Lower N. asperus)	<u>Clavifera triplex</u>	Common in coal palynoflora dominated by <u>Proteacidites</u> and <u>Phyllocladidites mawsonii</u>
SWC 3	1299.0	(Lower N. asperus)	<u>Proteacidites reflexus</u>	Rare sp.
SWC 2	1299.5	?Lower N. asperus	<u>Clavifera triplex-Phyllocladidites mawsonii</u>	-dominated coal palynoflora
SWC 2	1299.5	?Lower N. asperus	<u>Gephyrapollenites cranwelliae</u>	Uncommon sp.
