ABSTRACT

The samples studied are from the Angahook 85, Boonah 12 & Boonah 13 bores. These onshore bores are located on the Torquay Embayment at the eastern end of the Otway Basin, Victoria.

One sample from each bore was examined for Palynological dating. The sample from Boonah 12 at 5.05 - 5.1m and Boonah 13 at 14.90m lie within the Eastern View Coal Measures. The spore pollen assemblages for these samples indicate an age of Late Paleoccoe (Upper L. balmei Zone). The Angahook 85 sample at 20.36 - 2(.4m, from the Demon's Bluff Formation, contains a spore pollen assemblage of Late Eocene - early Oligocene (Upper N. asperus Zong).

The samples were submitted by A M Cooney of the Engineering Geology Section, Geological Survey.

RESULTS

SAMPLE	TYPE	DEPTH (m)	CONFIDENCE RATING	SPORE-POLLEN ZONE (STOVER & PARTRIDGE '73)	AGE
Angahook 85	core	20.36-20.4	1	Upper <u>N. asperus</u> Zone	Late Eocene - Early Oligocene
Boonah 12	core	5.05 - 5.1	1	Upper L. balmei Zone	Late Paleocene
Boonah 13	core	14.9	1	Upper L. balmei Zone	Late Paleocene

COMMENTS

Microplankton are of rare occurrence in the Angahook 85 sample and suggest a restricted marine environment. Based on an absence of index species for the Middle <u>N. asperus</u> Zone and the <u>P. tuberculatus</u> Zone, and on the presence of <u>Proteacidites rectomarginus</u> (relatively common), <u>P. stipplatus</u> and <u>S. barungensis</u>, and age of Upper <u>N. asperus</u> Zone (Late Eocene - Early Oligocene) is indicated.

The samples from Boonah 12 and Boonah 13 contain spore pollen assemblages of Upper L. balmei Zone (Late Paleocene age). (Species include) Lygistepollenites balmei, Proteacidites grandis, P. leightonii, P. annularis, Malvacipollis subtilis, Gambierina rudata and G. edwardsii.

Reworked Cretaceous species are present in the Boonah 12 and Boonah 13 samples, and the Permian species <u>Parasaccites gondwanensis</u> occurs in the Boonah 12 sample.

The zonation scheme used is that of Stover and Partridge 1973 in Proc. R. Soc. Vic., Vol. 85 Pt 2 : pp 237 - 286.

1

CONFIDENCE RATINGS - DEFINITIONS

0: SWC or CORE, <u>EXCELLENT CONFIDENCE</u>, assemblage with zone species of spores, pollen and microplankton.

2

h

- 1: SWC or CORE, <u>GOOD CONFIDENCE</u>, assemblage with zone species of spores and pollen <u>or</u> microplankton.
- 2: SWC or CORE, <u>POOR CONFIDENCE</u>, assemblage with non-diagnostic spores, pollen and/or microplankton.
- 3: CUTTINGS, <u>FAIR CONFIDENCE</u>, assemblage with zone species of either spore and pollen or microplankton, or both.
- 4 : CUTTINGS, <u>NO CONFIDENCE</u>, assemblage with non-diagnostic spores, pollen and/or microplankton.
