

2-98 Anemone 1A

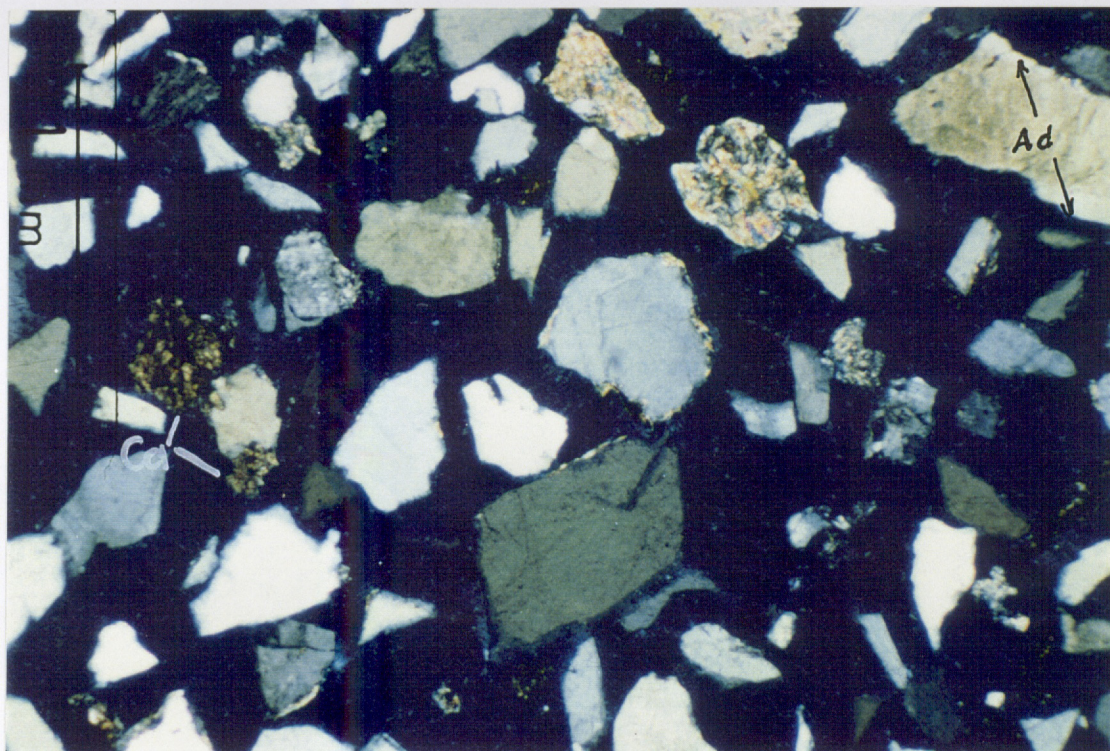

Figure 7 - Anemone #1, cuttings 4600 - 05m. (Plane polarized light). The larger grains in this field of view probably represent the true grain size from this interval. Some dark, hydrocarbon stained carbonate can be seen as individual grains as well as attached to, and corroding, framework grains. One dusty, incipiently sericitized feldspar grain has clear rims of adularia, or authigenic feldspar. Other feldspar show considerable dissolution.
