ONLINE COMMENTS

All gunstrings operating with gun # 4 as spares.
 Mild swell noise visible on RMS Display for all streamers
 Guns operating at fluctuating depth d/t Wx

PROCESSING QC COMMENTS

Mild swell noise on line effecting 5-10% of traces.
 Strum and head wave energy apparent.
 Some low amplitude <7ubars, high frequency noise with moveout throughtout line. Most likely screw noise from supply vessel along side Bream A platform.

Streamers - TUS Guardian

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Near field data recorded on aux channels 1-12 first 2000 ms	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

Array separation	37.5 m
Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source

ONLINE COMMENTS

All gunstrings operating with gun # 4 as spares.
 Guns depth fluctuating d/t Wx.

PROCESSING QC COMMENTS

Mild swell noise on line, occasional moderate burst. Affects 5% to 10% of traces.
 Strum and head wave energy apparent.

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.
 Partial progressive infill d/t DMU lockup on Seq # 134
 SPs 1879 - 1730 acquired for minimum line length

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.

ONLINE COMMENTS

All gunstrings operating with gun # 4 as spares.
 Gun depth erratic d/t swell.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise
 Strum and head wave energy apparent due to good weather and clean data quality.

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.
 F2 Line d/t Seq 142 DMU lock up
 SPs 1973-1730 acquired for 5km minimum line length
 Mild swell noise visible on RMS Display for all streamers

PROCESSING QC COMMENTS

Mild swell noise affecting < 5% of traces, easing towards EOL.
 Strum and head wave energy apparent due to good weather and clean data quality.

SR/V Veritas Viking II

ONLINE COMMENTS

All gunstrings operating with gun # 4 as spares.
 Original seq 144 - Reshoot
 S27 gun occasionally erratic depth d/t sea state.

PROCESSING QC COMMENTS

Mild level to moderate swell noise on line, generally effecting 5% of traces.
 Strum and head wave energy are observed

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise
 Strum and head wave energy apparent due to good weather and clean data quality.
 Diffraction energy observed on the midway of line, at near offset zone and time gate at 5.5 sac above.
 Work boat screw noise was observed on the RMS noise map.

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.

ONLINE COMMENTS

All gun strings operating with gun # 4 as spare.
 SP 1600 to 1375. Disabled manifold pressure in GCS90 d/t no signal.

PROCESSING QC COMMENTS

Mild level of swell noise energy on line, effecting < 5% of traces. .
 Strum and head wave energy observed along the line

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.

ONLINE COMMENTS

All gunstrings operating with gun # 4 as spares.
 Gun depth indicator on S-27 occasionally deep, max 6.6m

PROCESSING QC COMMENTS

Shots free from any discernable swell noise at the every 200th shot interval QC samples
 Strum and head wave energy apparent due to good weather and clean data quality.
 QCN reports spike in Gyro data d/t Spectra bug. When gyro moves through spectra software creates spike.

SR/V Veritas Viking II

ONLINE COMMENTS

All gunstrings operating with gun # 4 as spares.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise
 Strum and head wave energy apparent due to good weather and clean data quality.
 Some low amplitude ~7ubars, high frequency noise with moveout throughout line. Most likely screw noise from supply vessel

ONLINE COMMENTS

Partial prime d/t bunkering original seq 128.
 All gunstrings operating with gun # 3 as spares.
 Gun depths erratic d/t swell

PROCESSING QC COMMENTS

Mild swell noise on line effecting 5-10% of traces.
 Strum and head wave energy apparent.

ONLINE COMMENTS

All gunstrings operating with gun # 3 as spares.
 Guns operating at fluctuating depth d/t Wx

PROCESSING QC COMMENTS

Mild swell noise on line, occasional moderate burst. Affects 5% to 10% of traces.
 Strum and head wave energy apparent.

SOL/EOL Comments

LPSP 2117. Sp's 2123-2194 are Nav run-out shots to trouble shoot acoustics

Overall Line Observations

Pressure errors from SP 1013 to 1053 d/t depth scan delay being set to 3 and Xducer power delay being set to 1 causing inaccurate pressure reading during acoustic troubleshooting
All gunstrings operating with gun # 3 as spares.
Guns depth fluctuating d/t Wx.
Swell noise visible on data through out the line.

Birds bad/poll disabled:

Birds deep/shallow:

ONLINE COMMENTS

Pressure errors from SP 1013 to 1053 d/t depth scan delay being set to 3 and Xducer power delay being set to 1 causing inaccurate pressure reading during acoustic troubleshooting
 All gunstrings operating with gun # 3 as spares.
 Guns depth fluctuating d/t Wx.
 Swell noise visible on data through out the line.
 LINE Ran out to SP 2240 to Trouble shoot front end acoustics

PROCESSING QC COMMENTS

Mild swell noise on line effecting 5-10% of traces.
 Strum and head wave energy apparent.

ONLINE COMMENTS

All gun strings operating with gun # 3 as spares.

PROCESSING QC COMMENTS

Mild swell noise on line, effecting <5% of traces. Almost negligible.
 Strum and head wave energy are observed Mean Gyro result erroneous d/t spectra software spiking when gyro swings thru zero.

SR/V Veritas Viking II

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.
 Gun depths erratic d/t swell

PROCESSING QC COMMENTS

Mild swell noise on line, effecting <5% of traces. Almost negligible.
 Strum and head wave energy apparent due to good weather and clean data quality.

Streamers - TUS Guardian

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Near field data recorded on aux channels 1-12 first 2000 ms	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

Array separation	37.5 m
Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.
 No Seisnet QC data available until SP 1615 d/t pre SOL system crash

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.
 V1G1 out Sp 1970 - 2044

RTNU	Real Time Navigation Unit	NCN	Navigation Calculation Node

Client: **Esso Australia Pty. Ltd.**Line name: **G06A-2512F1-177**Seq: **177**Dir: **10.5°****Streamers - TUS Guardian**

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Near field data recorded on aux channels 1-12 first 2000 ms	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

Array separation	37.5 m
Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Strum and head wave energy apparent due to good weather and clean data quality.

THE GUN TYPES ARE:

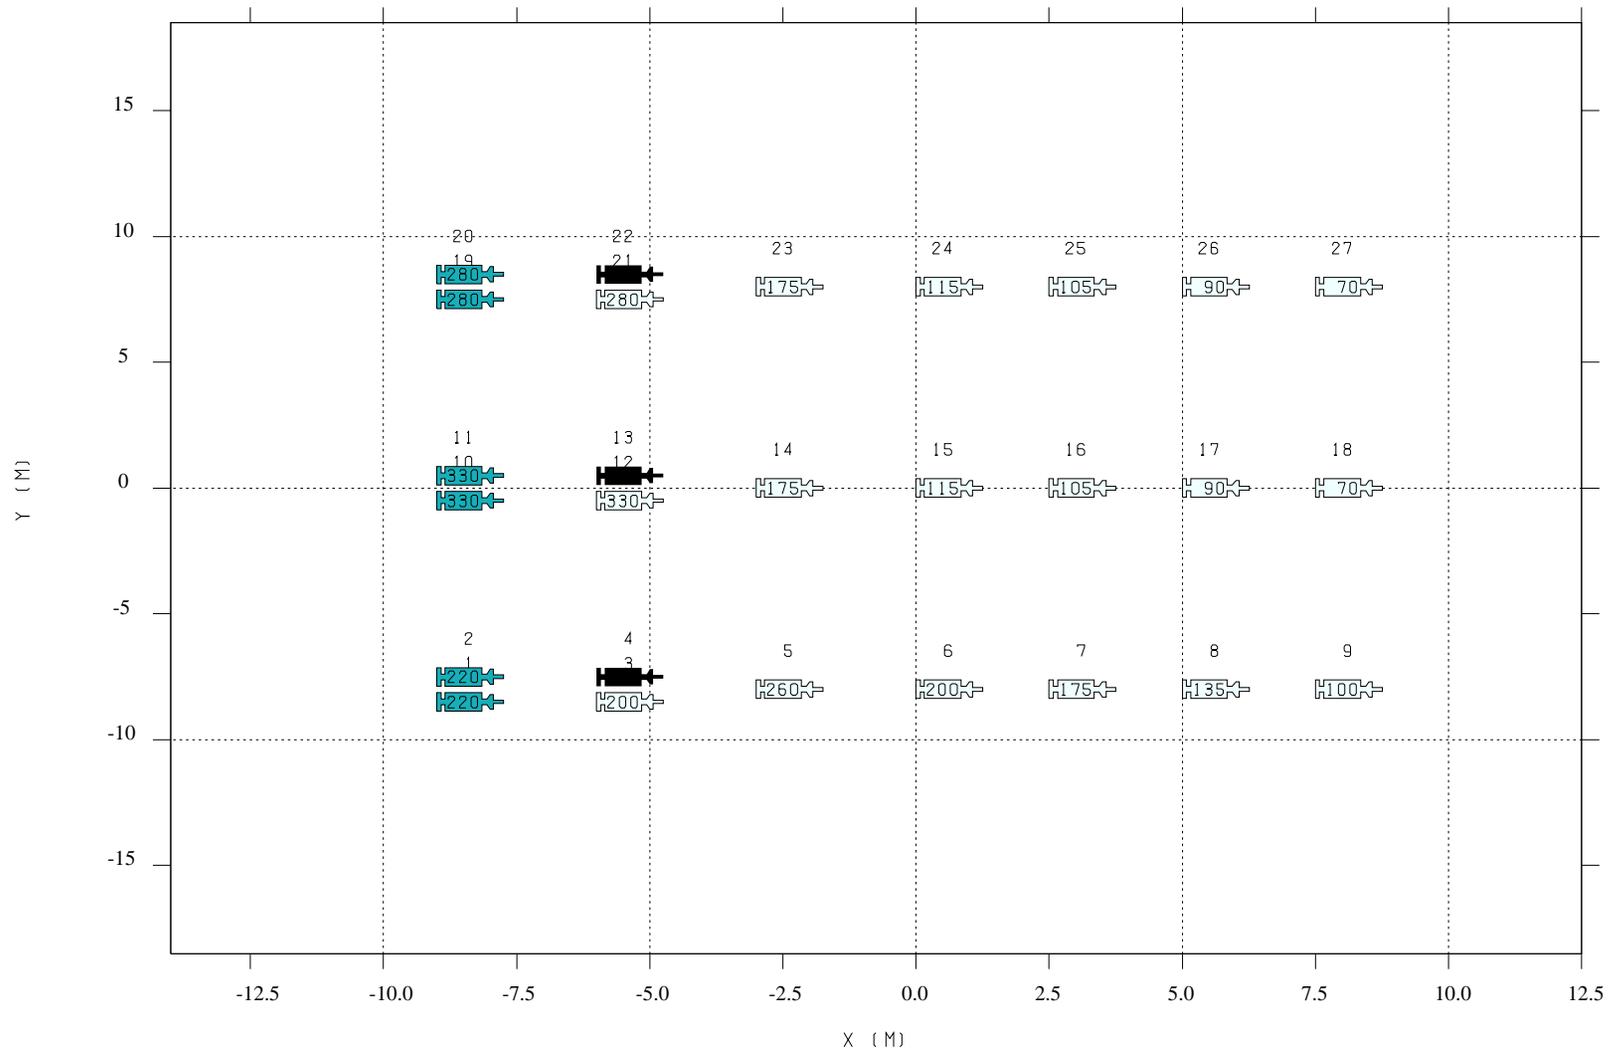

- 13: BOLT 1500 LL
- 18: BOLT 1900 LLXT

"WSK" IS THE RATIO BETWEEN THE PRIMARY VOLUME AND TOTAL CHAMBER VOLUME IN A BOLT 1500C GUN (TYPE 1) WITH WAVESHAP KIT

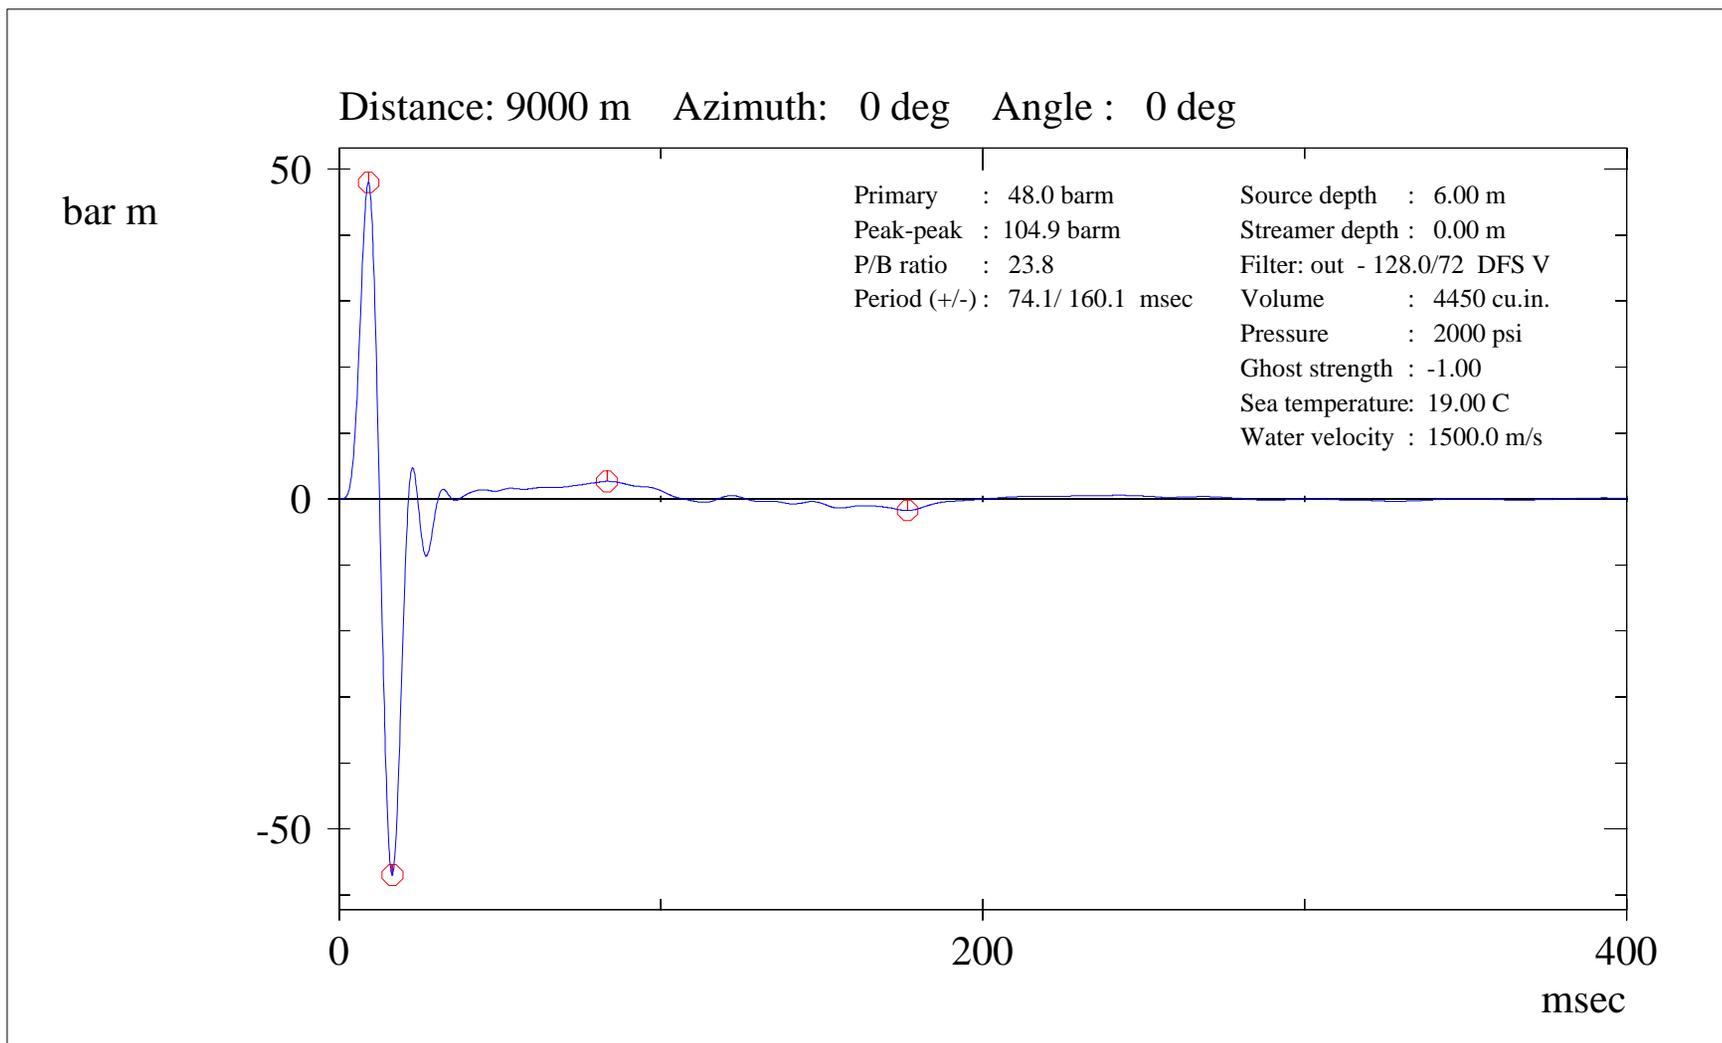

Array : T4450_8m

Total volume : 4450.0 cubic inch

-  Inactive guns
-  Single guns
-  Cluster guns

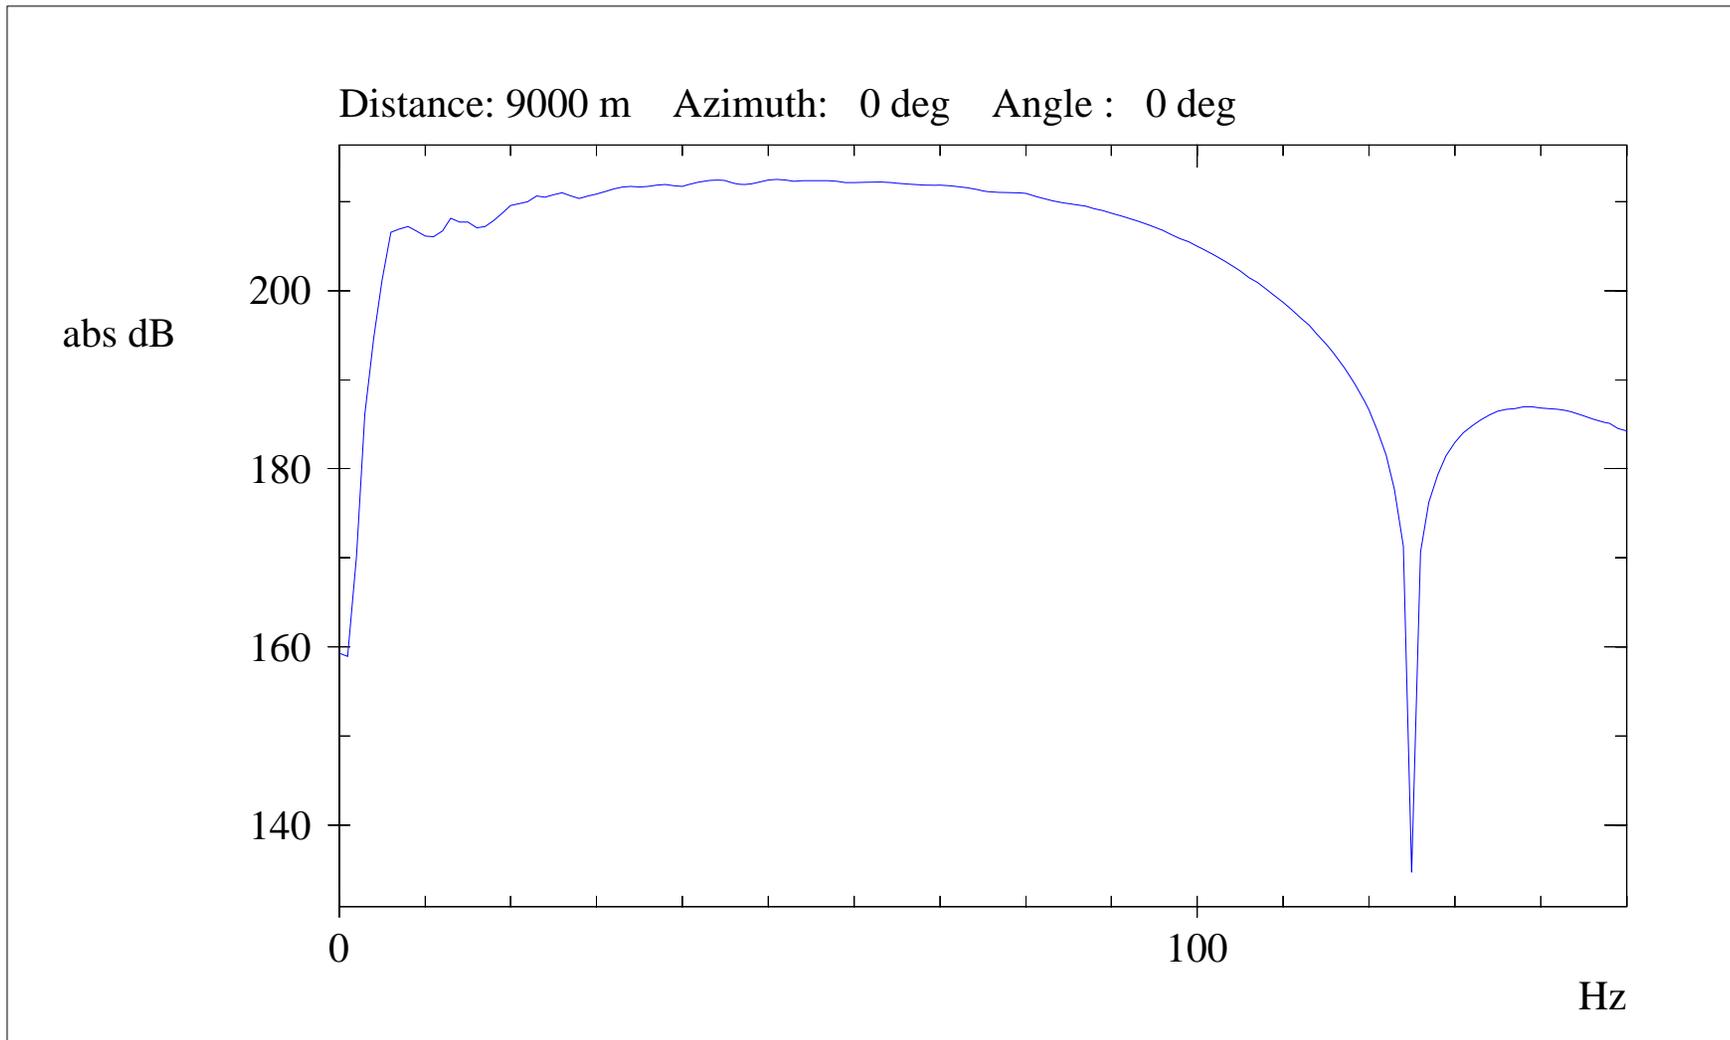

Far-field signature of array : T4450_8m

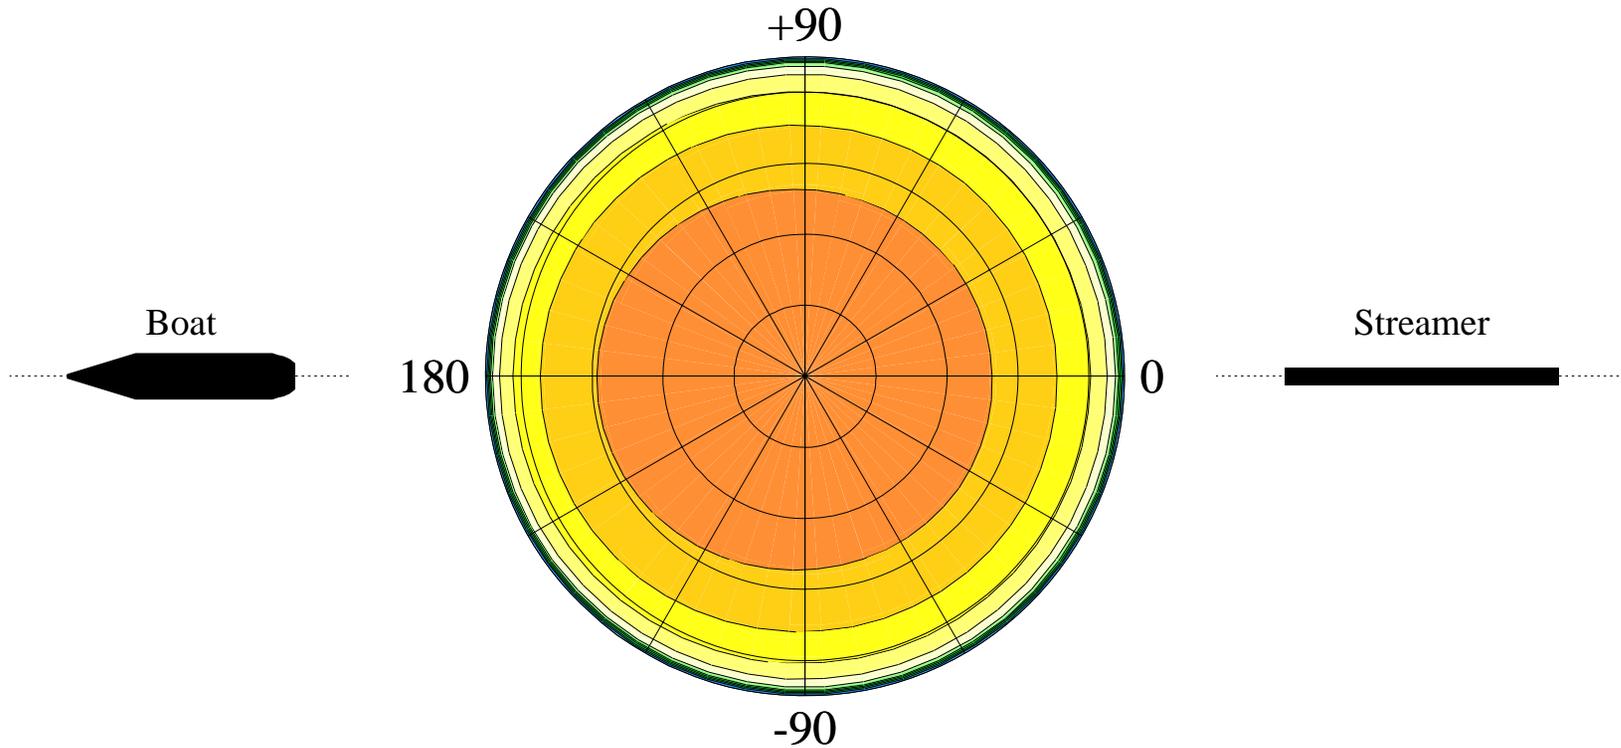

Source Depth 6m - Temperature 19c

Amplitude spectrum of far-field signature of array : T4450_8m

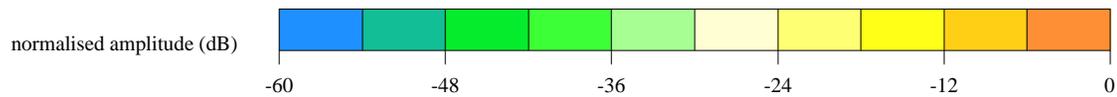

Source Depth 6m - Temperature 19c

Source Directivity Plot - frequency : 30.0 Hz. - array T4450_8m

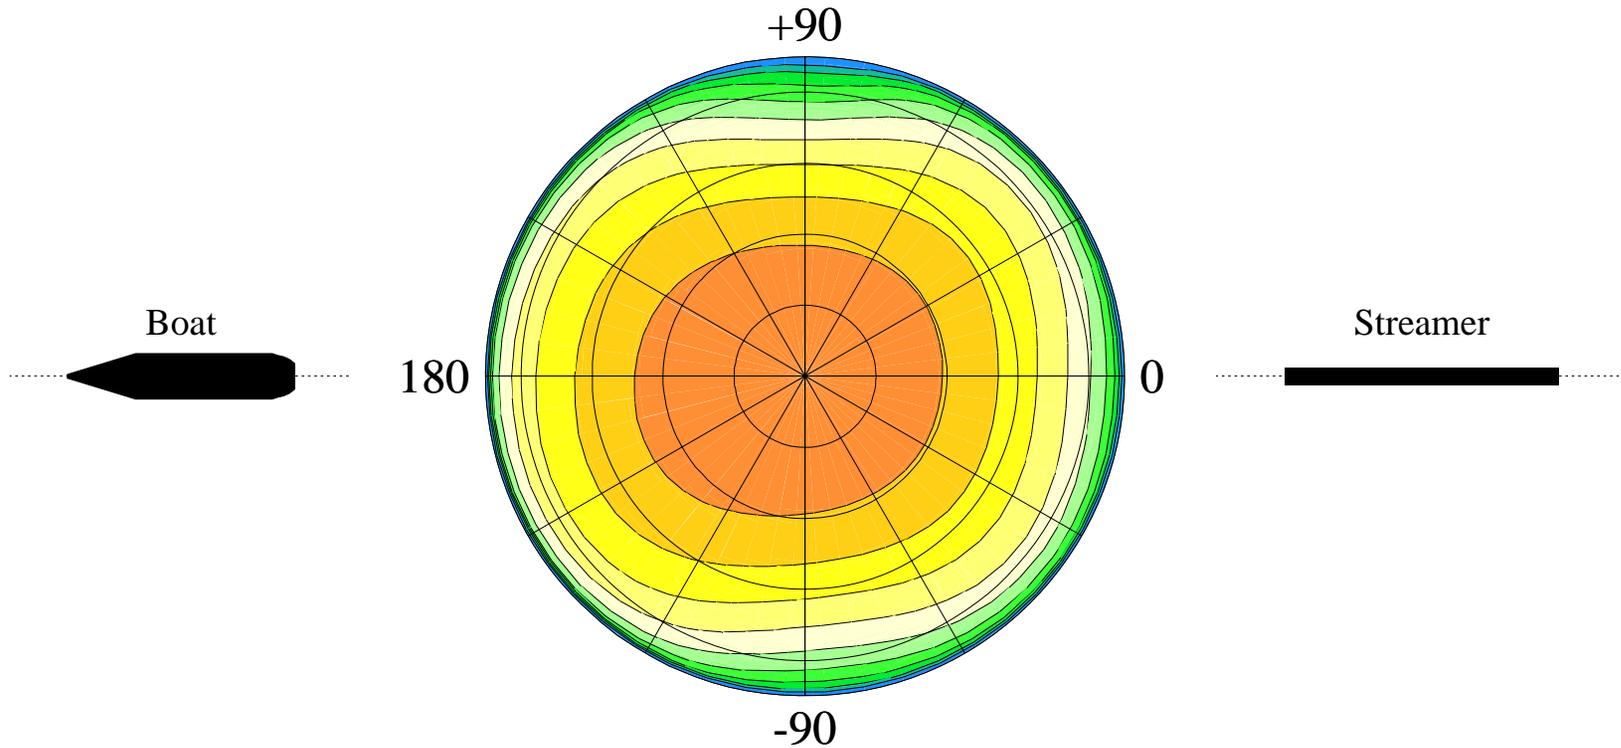

Azimuth angle marked in degrees.
Angle of vertical (0 - 90.0 degrees) plotted along radii.

Source Depth 6m - Temperature 19c

Source Directivity Plot - frequency : 60.0 Hz. - array T4450_8m

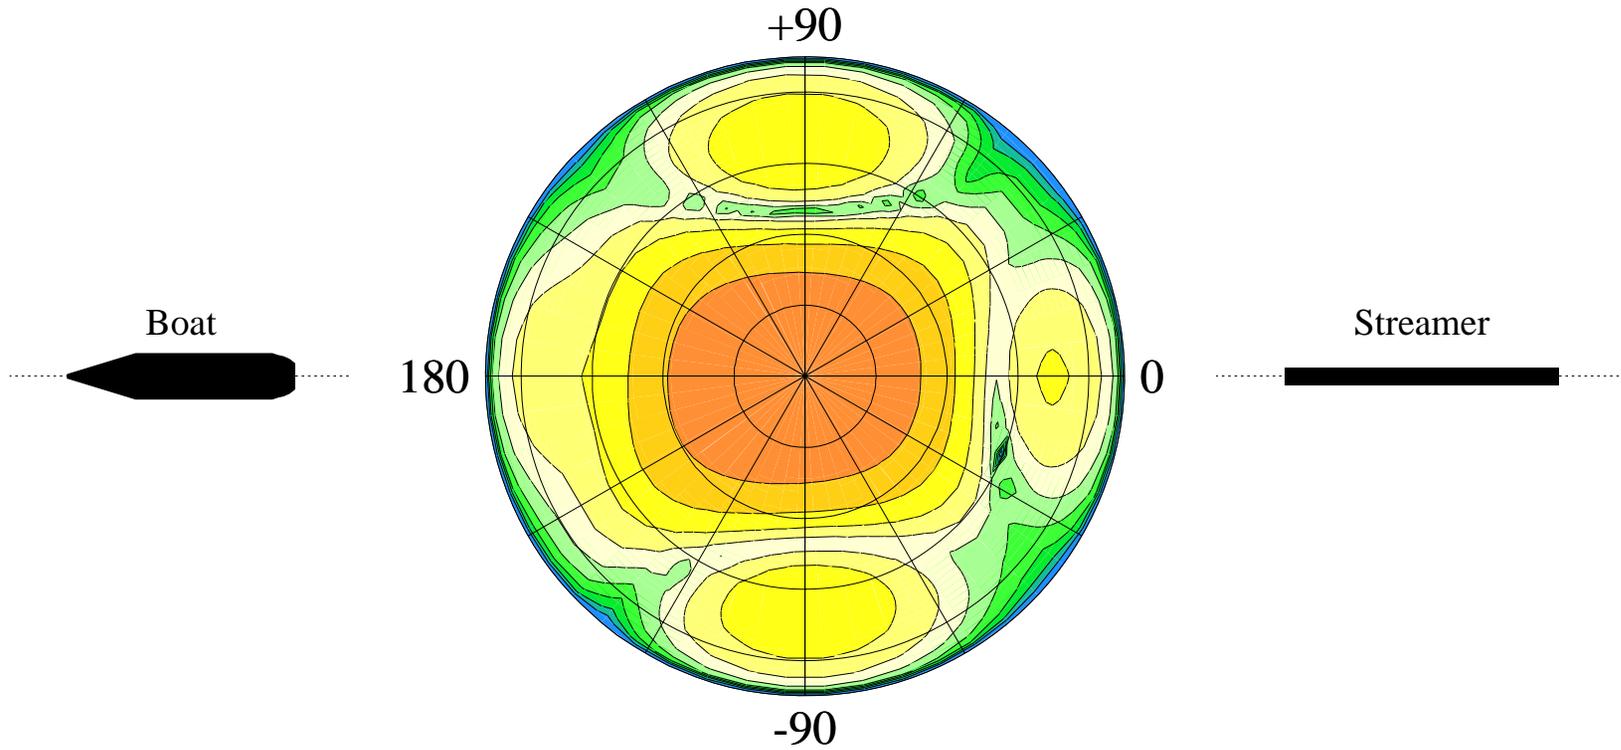

Azimuth angle marked in degrees.
Angle of vertical (0 - 90.0 degrees) plotted along radii.

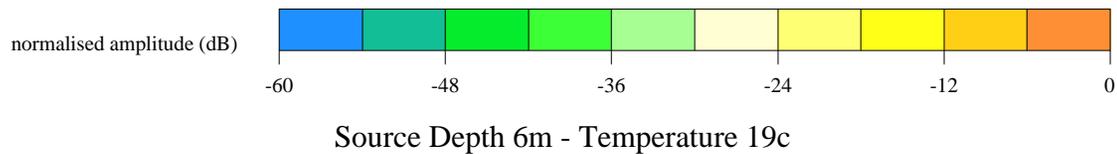

Source Depth 6m - Temperature 19c

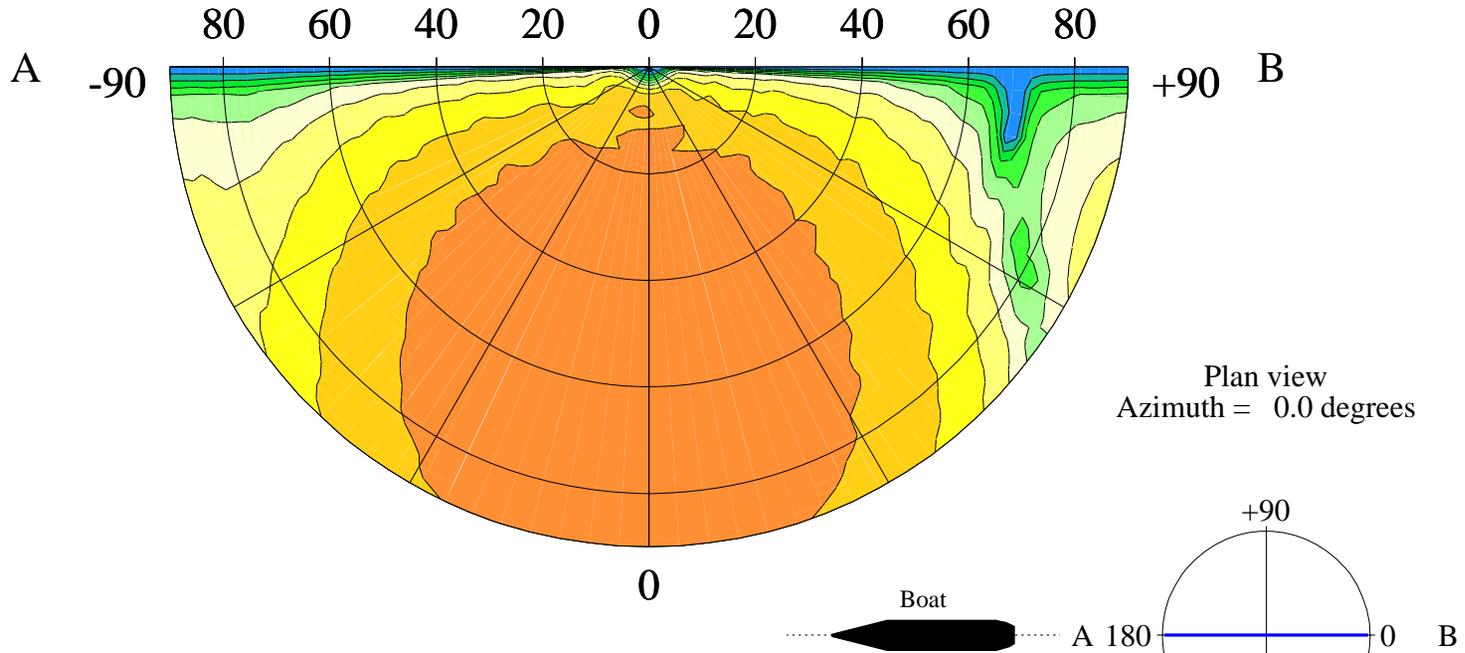

Source Directivity Plot - frequency : 90.0 Hz. - array T4450_8m

Azimuth angle marked in degrees.
Angle of vertical (0 - 90.0 degrees) plotted along radii.

Source Directivity Plot - azimuth : 0.0 degrees - array T4450_8m

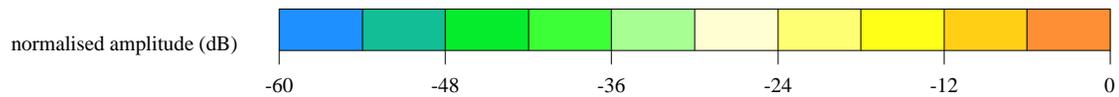

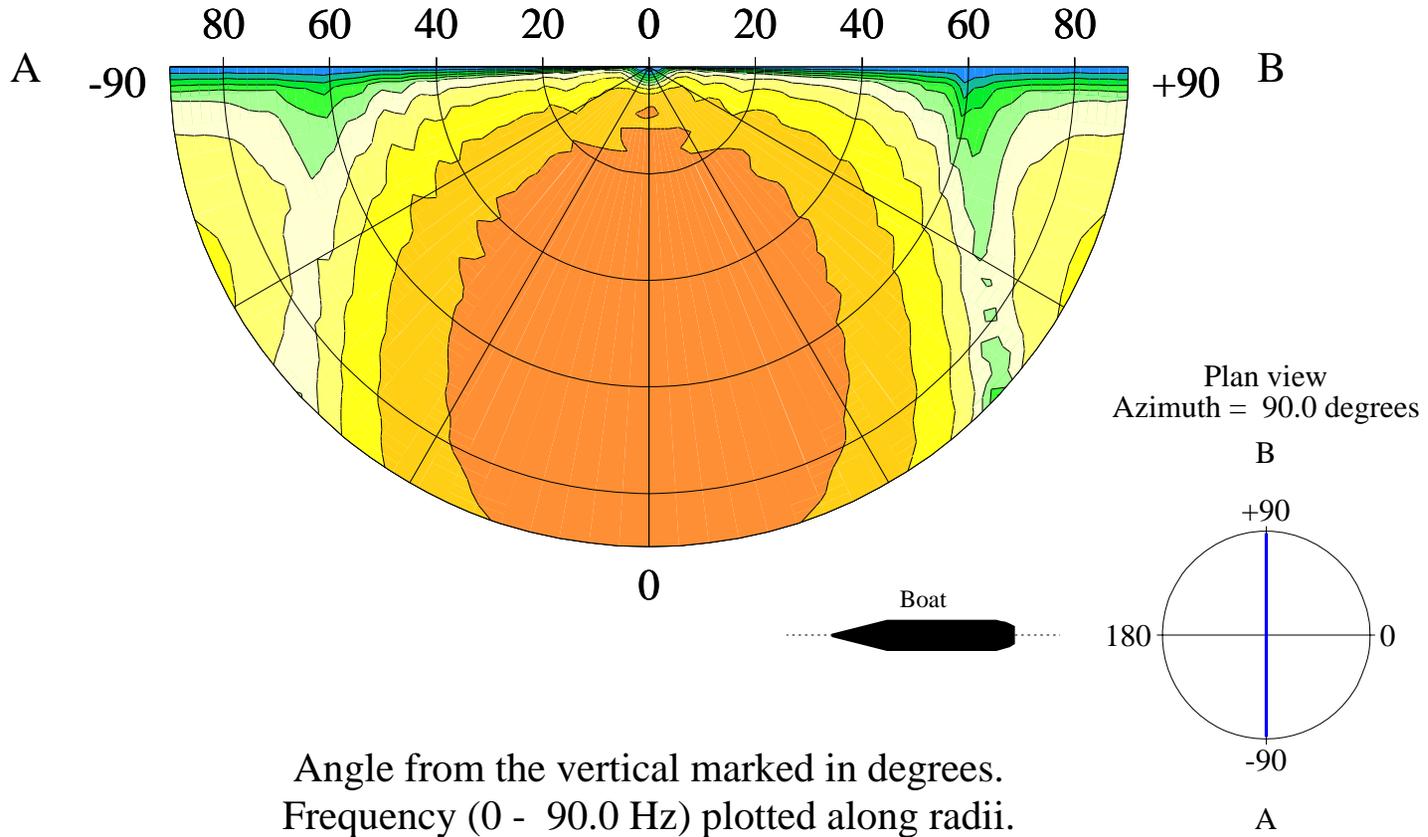

Angle from the vertical marked in degrees.
Frequency (0 - 90.0 Hz) plotted along radii.

Source Depth 6m - Temperature 19c

Source Directivity Plot - azimuth : 90.0 degrees - array T4450_8m

Source Depth 6m - Temperature 19c

Dropout and Spare Substitution Modeling

Criteria for Drop-outs:

Allowable loss in peak amplitude: <11%

Allowable change in p/b ratio : <15%

Allowable correlation coefficient: >0.998

Resulting Drop-out Rules:

Any single gun can be dropped **except:**

280 cu in gun in a cluster or

330 cu in gun in a cluster.

Any direct substitution (280 for 280 or 330 for 330) to mitigate the respective rule above is acceptable.

Any 2 gun drops are acceptable **except:**

- (1) any combination involving the illegal single gun drops listed above
- (2) 260 cu in gun and a non-clustered 330 cu in gun,
- (3) 260 cu in gun and a non-clustered 280 cu in gun,
- (4) 220 cu in gun and a non-clustered 330 cu in gun,
- (5) 220 cu in gun and 260 cu in gun,
- (6) 105 cu in gun and 135 cu in gun,
- (7) 105 cu in gun and 115 cu in gun, or
- (8) both 105 cu in guns.

Any direct substitution to mitigate the respective 2 gun drop rule above is acceptable. (1),(2),(3),(4)

For rule (5), activating the spare 200 cu in gun and spare 330 cu in gun is acceptable.

No acceptable mitigation measure available for rules (6), (7), and (8).

Additional gun drops following a substitution are **illegal** unless confirmed by modeling and approved by onboard client rep.

All 3-gun combinations are **illegal** unless confirmed by modeling and approved by onboard client rep.

Bream 3D Marine Source Modeling – Pacific Sword

Criteria for Drop-outs:

Allowable loss in peak amplitude: <11%

Allowable change in p/b ratio : <15%

Allowable correlation coefficient: >0.998

Resulting Drop-out Rules:

Any single gun can be dropped **except**:

350 cu in gun in a cluster or

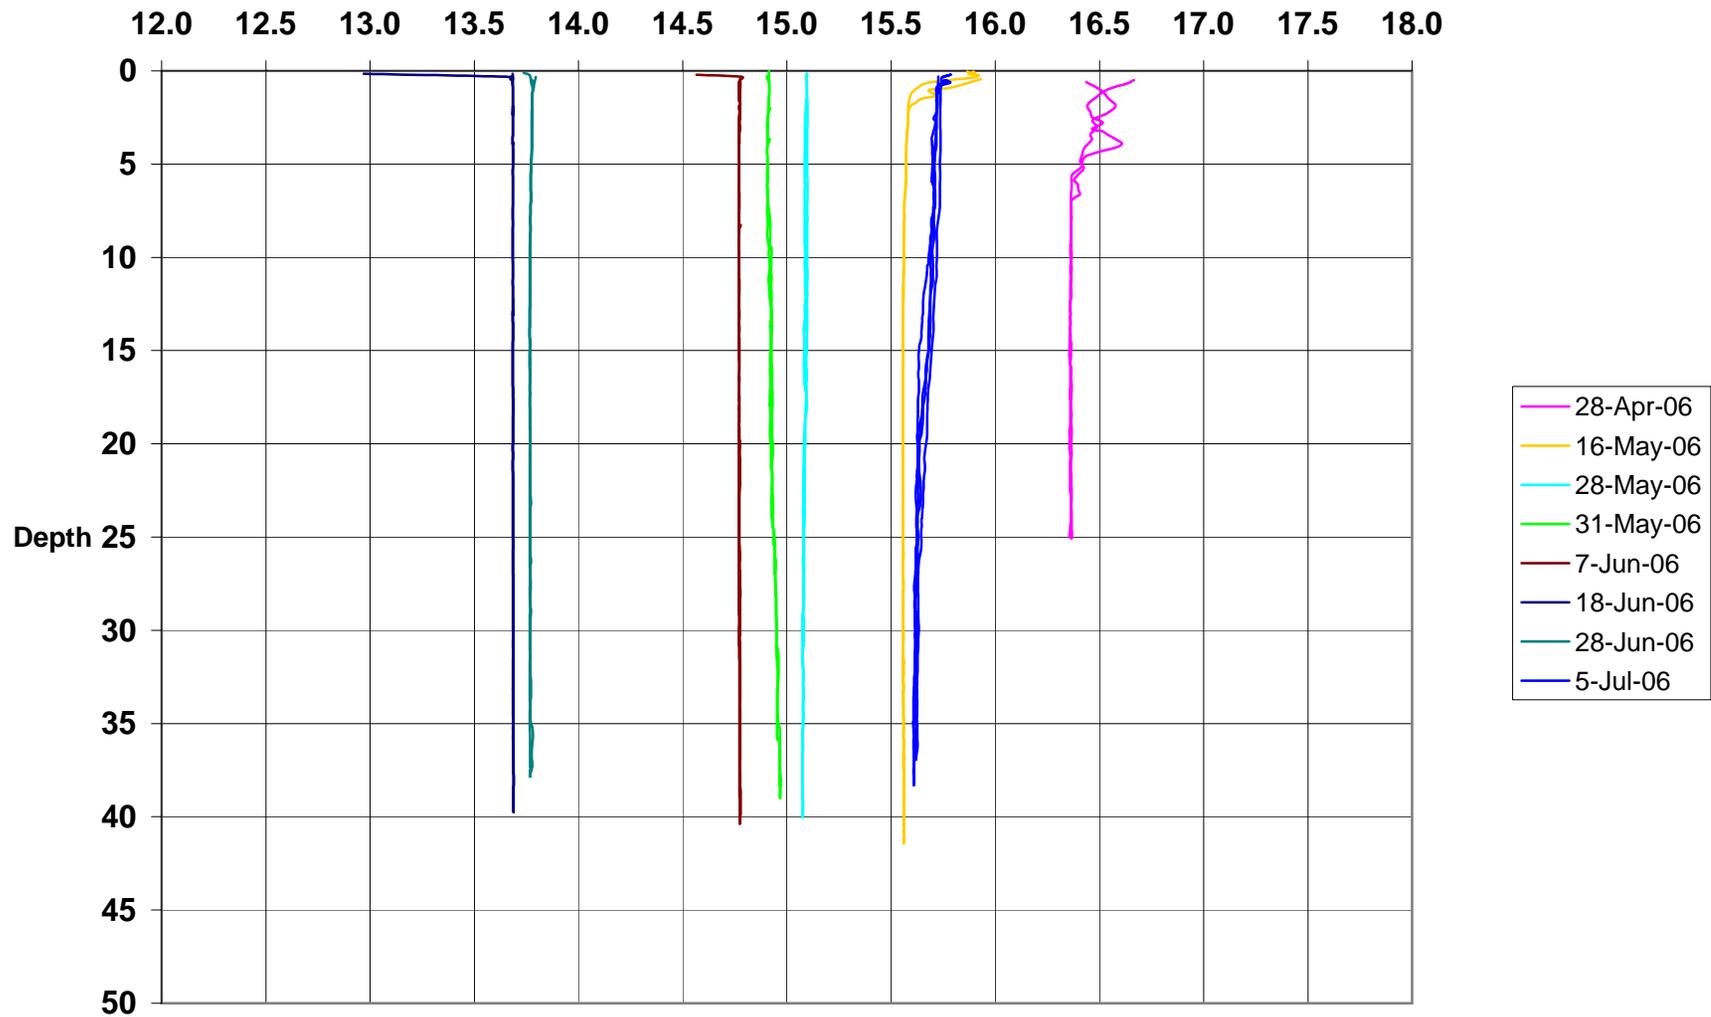

300 cu in gun in a cluster.

Any 2 gun drops are acceptable **except**:

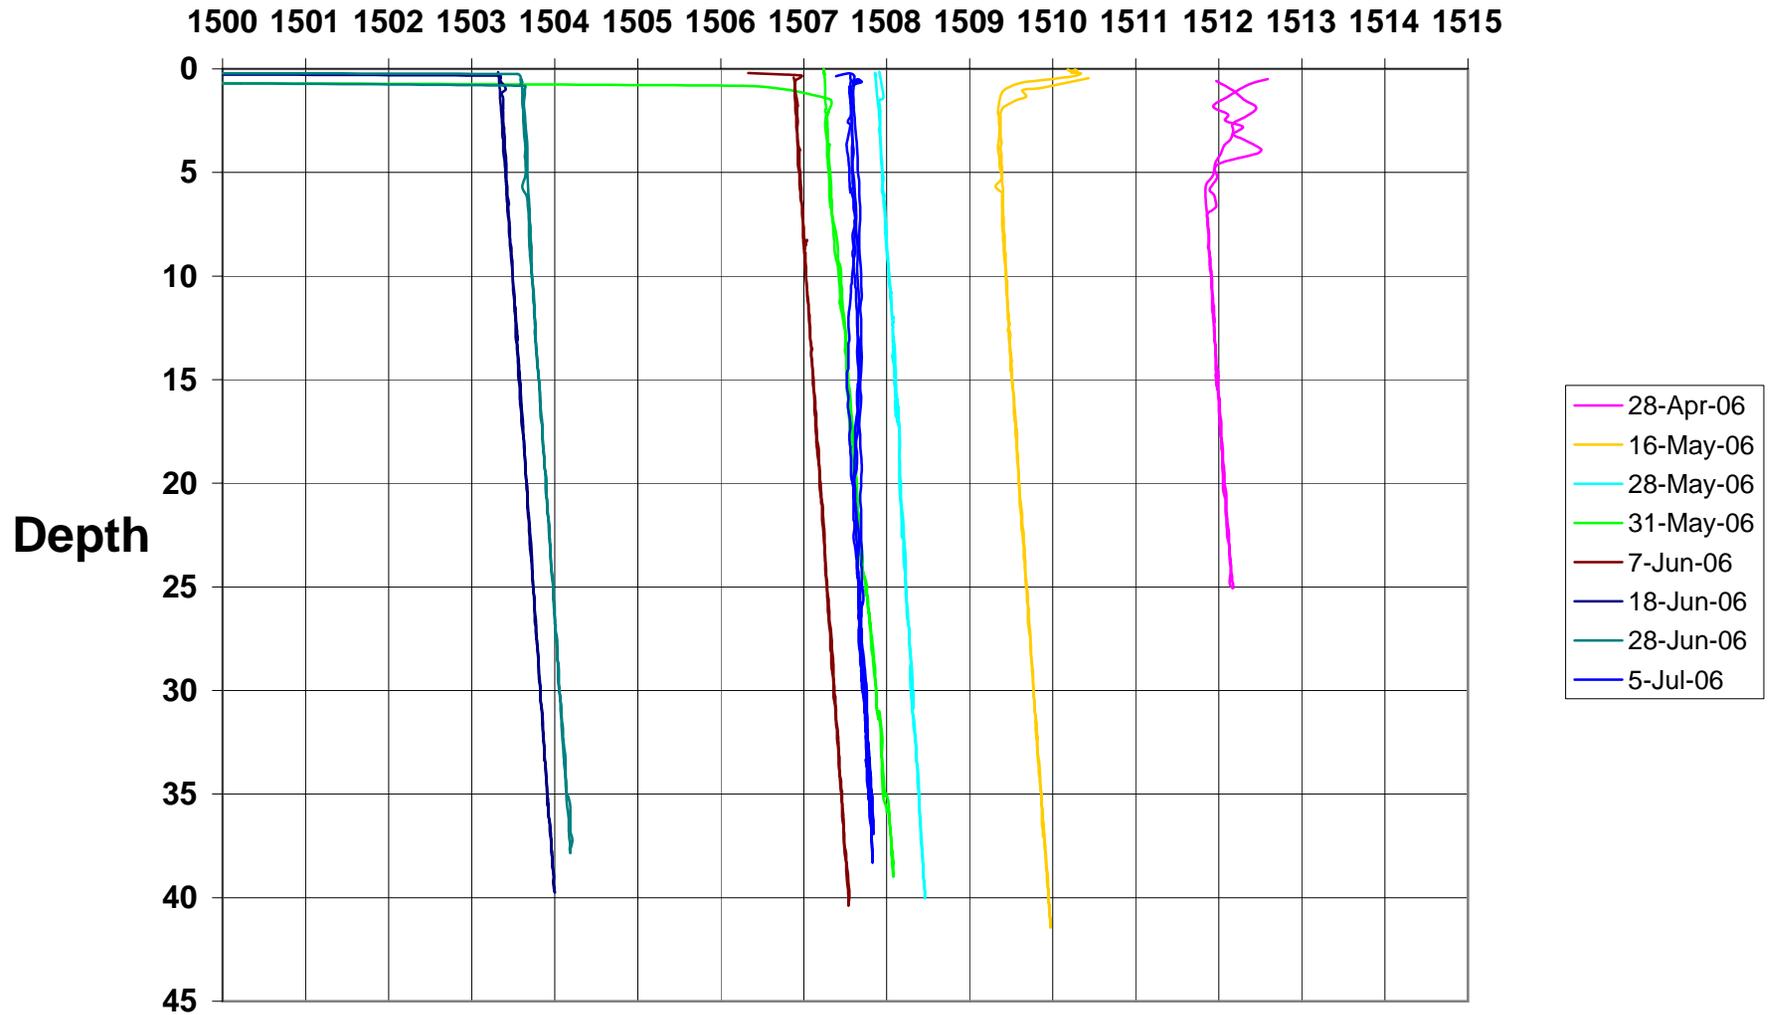

- 1) any combination involving the illegal single gun drops listed above
- 2) Gun #11 (350 cu.in.) and any other gun
- 3) Gun #4 (260 cu.in.) and any other gun
- 4) Gun #22 (100 cu.in.) and either Gun #6 (200 cu.in.), Gun #13 (100 cu.in.), Gun #14 (100 cu.in.), Gun #15 (80 cu.in.), or Gun #20 (200 cu.in.)
- 5) Gun #14 (100 cu.in.) and either Gun #6 (200 cu.in.), Gun #12 (200 cu.in.), or Gun #13 (100 cu.in.), or Gun #21 (100 cu.in.)

All 3-gun combinations are **illegal** unless confirmed by modeling and approved by onboard client rep.

Echosounder Verification

Date: 23 APR 06
Location: Fremantle, WA, Australia
29° 30.12 S 115° 45.05 E
Vessel: Veritas Viking 2

General

A verification of the Simrad EA500 Echosounder installed on the SR/V Veritas Viking2 was performed at dockside, Fremantle, WA on 23 APR 06 from 0452 UTC - 05:15 UTC. Rick Fleming and Thomas Tibor of Veritas DGC carried out the verification.

Procedure

To carry out this procedure, data from the Echosounder were compared with water depth under the Echosounder calculated from measured total water depths and ships draft. All sounding were done twice and the average value used.

Measured total water depth:

The position of the transducer was located on the exterior of the ship's hull. This position is marked by the symbol E/S. A plumb line was then dropped from the Port side of the vessel in line with the transducer in order to minimise any deviations in the bottom contour. The first measurement was made from the top of the railing on the vessel's side to the Water Surface. The second measurement was taken from the railing to the sea floor. The difference in these two measurements was then calculated to find the actual water depth on the stbd side. The same procedure was then used on the port side. The water depth at the Echosounder was then calculated based on the port and stbd soundings. This assumes a linear or flat bottom. The actual seabed contours could not be accounted for. The vessel at the time was portside to the dock.

Calculated Ship's Draft:

Readings of the ship's draft at the bow and stern and port and starboard sides were taken. With these observations and knowing the locations of the draft marks a weighted average was computed for the actual draft at the location of the Echosounder. The draft marks on the port and starboard bow were assumed to be a point, since their location is only 2 metres apart and the readings were identical. Figure 2 shows draft mark and Echosounder locations.

C-O Calculation:

The calculated ship's draft at the Echosounder was then subtracted from the calculated total water depth at its location, yielding the calculated water depth underneath the Echosounder.

Diagrams and Calculations

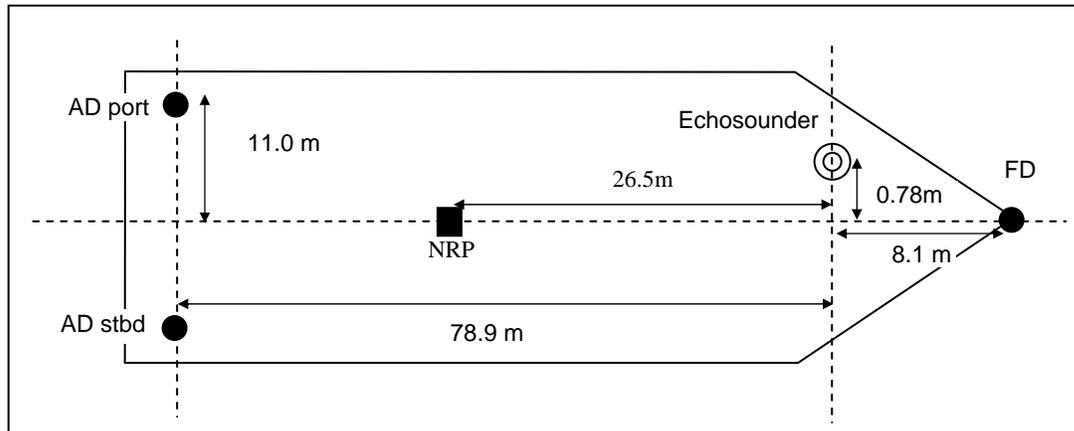

Figure 1: Schematic of draft mark and Echosounder positions, Veritas Viking 2.

OBSERVATION	VALUE (METERS)
Fwd Draft Mark	6.0
Aft Stbd Draft Mark	6.0
Aft Port Draft Mark	6.0
Depth of ES Head Below Hull	0
Calculated Draft at Echosounder	6.0
Stbd Rail to Seabed	24.62
Stbd Rail to SWL	12.04
Stbd Water Depth	12.58
Port Rail to Seabed	23.08
Port Rail to SWL	11.97
Port Water Depth	11.11
Calculated Water Depth at Echosounder	11.78
Calculated Water Depth under Keel	5.8
Calculated Echosounder Reading (Depth under Keel)	5.8
Observed 200 kHz Echosounder Reading (Average)	6.45
C-O of Echosounder in shallow water (m)	-0.65

Table 1: Results of the Simrad EA500 verification

Conclusion

The verification procedure showed a calculated – observed offset in the Echosounder of -0.65 m, which is within specification for the Echosounder in shallow water. There was also a measurable downward grade in the seabed causing a difference in depth of 1.47m between the port and stbd side. We took the average between the two readings that would have introduced some error into the calculated water depth.

Produced By: Rick Fleming/Thomas Tibor

Vessel Specifications

The Veritas Viking II is a purpose built, multi element seismic research vessel, rigged to acquire multiple lines of 3-D marine seismic data. The vessel is owned by Eidesvik & Co. AS and on long-term charter to Veritas DGC, and crewed by marine personnel in the employ of the vessel owners.

The vessel is equipped with advanced integrated geophysical and navigation data acquisition systems, full quality assurance capabilities and onboard navigation and seismic data processing.

General Information

Name	SRV Veritas Viking II
Owner	Eidesvik & Co A/S
Port of Registry	Haugesund - Norway
Date Built	1999
Official Number	9189512
Call Sig	LJQK3

Classifications

Flag	Norwegian International Flag (NIS)
Classifications	DNV + A1, SF, EO, HELDK.DK+, SBM

Dimensions

Length	93.35 meters
Beam	22.0 meters
Draft	6.5 meters
Gross Tonnage	8000 tons
Light Displacement	6200 tons

Machinery

Propulsion	2 MaK 9m 32, 4320 kW (5832 BHP) each
Bow Thruster	1 x Kamewa Group Aquamaster 1200 kW azimuth thruster
	1 x Brunvoll FU-80-LTC-1200Kw
Stern Thruster	1 x Brunvoll FU-63-LTC-1750Kw Tunnel Thruster
Generators	2 x AVK - DSG 114KI-6W – Rating: 2 x 2950KVA, 3 phase x 440V, 60Hz,
	Auxiliary - 1 Mitsubishi S6R-MPTA- 525Kw
	Emergency – 1 Mitsubishi S6B3-MPTK 360Kw.
Maximum Speed	16.8 knots
Cruising Speed	15.5 knots

Compressor

--	--

Manufacturer	3 x Arial
Supply rate	1540 scfm
Nominal operating pressure	2000 psi +/- 50 psi
Minimum refilling time	7 seconds for 4450 cu in 5 seconds for 3255 cu in

Capacities	
Average Fuel Consumption	28 m ³ /day
Endurance	110 days approximately
Range at Cruising Speed	43,000 nautical miles
Fresh Water Capacity	1,261 m ³ and 25 m ³ /day
Lubricating Oil Capacity	20 m ³
Streamer Oil Capacity	2 X 10 m ³ liters
Fuel Oil Capacity	2043 m ³
Slops	12 m ³
Sewage	20 m ³

Electronics	
Bridge Equipment - Robertson Multi-Purpose Pilot (RMP) System, comprising:	2 x AP9 Mk II Autopilot
	1 x Robtrack Integrated Maneuvering System with Joystick controls
	1 x RDN 50 Disc Navigation System
	1 x ECDIS Remote Display in instrument room
	1 x Robdiff GPS Navigator
	2 x RGC-11 Gyro Compasses and RGC 10/11 Distribution Unit
	2 x ARPA Radar

Communications Equipment	
VHF Radios	
Manufacturer	Sailor
Type	RT 2047 and RM 2042
Quantity	Two of each (four total)
Frequencies	Synthesized
HF Radio	
Manufacturer	Sailor
Type	H2192
Quantity	One
Frequencies	Synthesized
Inmarsat	
Type	Inmarsat B
Manufacturer	EB Nera
Model	Bmarine
Frequencies	Bmarine

Doppler Log	
Manufacturer	JRC
Type	JLN-203
Weather Fax	
Manufacturer	Raytheon
Type	Rayfax-500
Quantity	One

Health, Safety and the Environment (HSE)

Conforms to all Det Norske Veritas, Solas, IAGC and E&P forum requirements.

Berths	60
M.O.B. Boats	2 Norsafe – Magnum 750 – 10 persons each
Workboats	1 x Norpower 22
Life Boats	1 x Schat Harding MCB28 – 60 persons
Life Rafts	8 x Surviva, 20 persons each
Survival Suits	70

Fire Fighting Systems	
Engine Room	Carbon Dioxide
Compressor Room	Carbon Dioxide
Instrument Room	Carbon Dioxide
Streamer Storage	Aero Foam
Helideck	Aero Foam
Main Fire Pumps	35,663 US Gal/hr
Auxiliary Fire Pumps	35,663 US Gal/hr

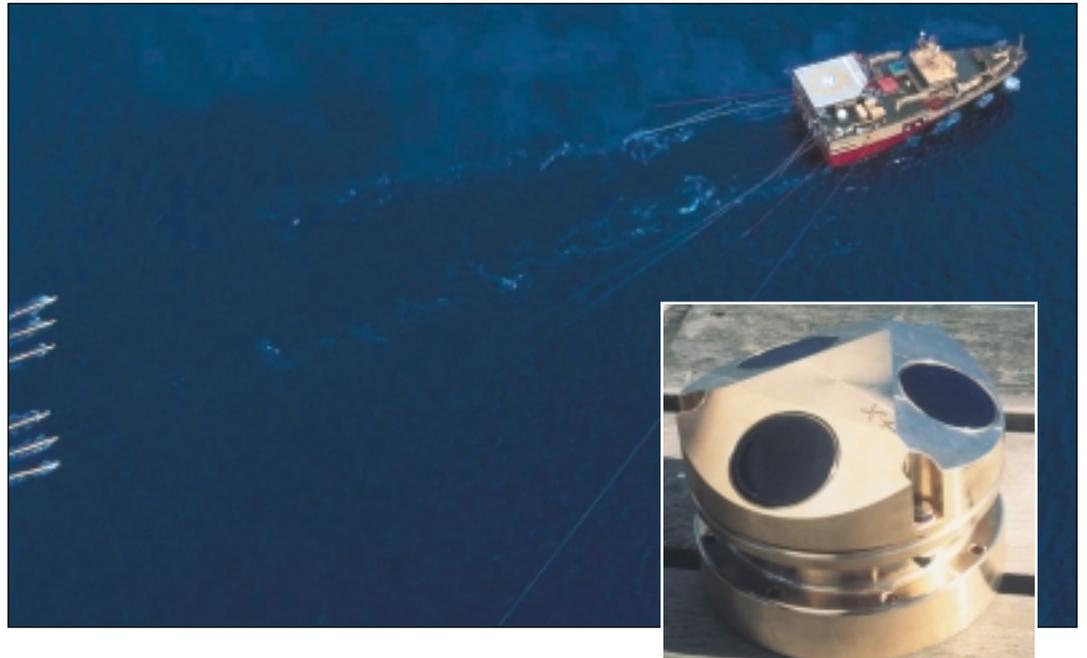

Aircraft Facilities	
Helicopter Deck Rating	Up to and including Sikorsky S-62N
Non-Directional Beacon	
Manufacturer	Skanti
Type	TV8-250B
Frequencies	410 kHz

Ship-Air Communications	
Manufacturer	ICOM
Type	ICA-200
Frequencies	Synthesized

Hand Portable	
Manufacturer	Walter Dittel
Type	FSG-05
Frequencies	Synthesized

Vessel-Mounted Current Profiler

A new level of simplicity, accuracy and performance

Nortek's Vessel-Mounted Current Profiler (VM-Profiler) is designed for permanent mounting on professional survey, offshore, and fishery vessels.

It measures the ocean current profile while moving and it does it with quality, accuracy, and a great price-performance ratio.

With the Nortek VM-Profiler, your marine operations will go faster and you will make operational decisions with better confidence than before.

The VM-Profiler works by measuring the Doppler shifted echo from the water below the hull. This Doppler shift is proportional to the water speed relative to the ship. The vessel motion is determined using the ship's navigation systems, including the required gyro and DGPS. In the software, the vessel motion is removed from the output data, leaving the user with the true ocean currents in ship coordinates or earth coordinates.

The VM-Profiler does not depend on "bottom track" as the primary means to measure the vessel motion. As a result, the currents in the near-

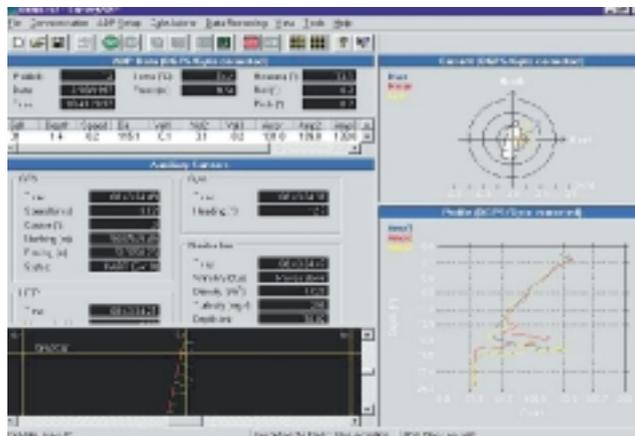

surface region can be determined regardless of the water depth or the water quality.

Further, calibration has never been easier. Make two 5-minute runs and press a software button. The VM-Profiler software does all the rest for you.

Features

The combination of robust design, quality data and user-friendly software gives the VM-Profiler several advantages:

- ✓ It shows you real time surface patterns where you survey
- ✓ High resolution near surface currents can be measured even in deep water
- ✓ Simple integration to navigation systems
- ✓ Simple calibration procedure
- ✓ Can be used as high-quality speed log
- ✓ Works at any water depth and is insensitive to bottom conditions

Software

The VM-Profiler software runs under any WIN32 operating system, and collects data from the Profiler, the DGPS receiver, and the ship's gyro. Real-time data are shown as polar plots, as vertical profiles of speed and direction, and as stick plots that are overlaid a track plot. Binary and ASCII output strings are available in a multitude of formats for easy integration into other on-line computer systems. Data can be analyzed in the time domain using Explore post processing software from Nortek.

System

Acoustic frequency	500 KHz, 1.5 MHz
Acoustic beams	3, slanted at 25°
Maximum ship speed	20 knots

Current profile

	500 KHz	1.5 MHz
Maximum range	70-100m	15-25m
Depth cell size	1-12m	0.4-4m
Minimum distance to first cell	2m	0.8m
Maximum output rate	0.5 Hz	0.5 Hz
Internal sampling rate	2Hz	10Hz
Number of cells	Typical 20-40, max. 128	

Velocity measurements

Velocity range	±10m/s horizontal, ±5m/s along beam (inquire for higher ranges)
Accuracy	1% of measured value ±5cm/s
Resolution	0.1cm/s

Physical

Transducer material	Bronze
---------------------	--------

Power

AC Input	110/220 VAC, 50/60 Hz
DC Input	12-24 V
Operating power consumption	3-4 W

Cable & Connectors

Bulkhead	Impulse MBH - 16 - FS
Cable	Impulse MIL - 16 - MP
Cable length	10, 30 or 60m (30m is standard)

Environmental

	Transducer	Processing unit
Operating temperature	0-40°C	±5-45°C
Storage temperature	±10-50°C	±20-60°C

Computer

Type	19" rack-mounted industrial Pentium type PC with 17" monitor and keyboard.
Data storage	2GB HDD, CD-ROM
Interface	Intelligent 8-port serial RS-232 or RS-422)

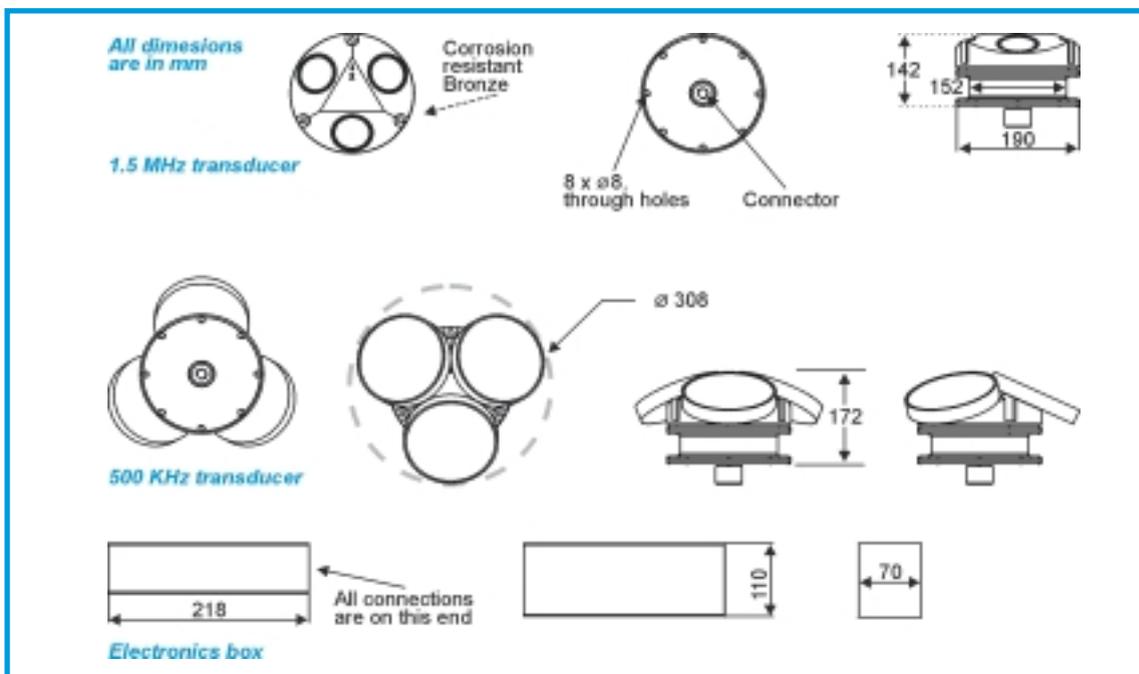

Interfaces

GPS	Sercel NR 203 NMEA 0183 (GP) Trimble 4000 position (ASCII) NMEA 0183 GLL/VTG NMEA 0183 GGA/VTG NMEA 0183 RMC Geco NYMEA 0183 PRTNS
Gyro	NMEA0183 HDT NMEA0183 HDM
Heave, pitch, roll	TSS 320B Scatpath 200 NMEA0183 PRDID
Anemometer	NMEA183 MWW Gill ASCII Mode 2
Custom	Navitracker
Serial output	NortekADP standard binary NortekADP ASCII NortekADP ASCII with STX/ETX char. NortekADP extended ASCII w. STX/ETX char* NMEA0183 VDVHW (speed log)

* Spectra navigations systems include a driver to read the Nortek Profiler extended ASCII serial output. Nortek will write custom interfaces for your devices. For simple ASCII data formats such as NMEA, Nortek will normally do this without extra charge.

Software

Operating system	WIN95/98, NT 4.0, WIN 2000
Online operation	Online configuration data recording to harddisk, online graphical data display, auto-calibration, data output to external devices.

Binning and Attribute Analysis for Seismic and Navigation Data

REFLEX

Comprehensive Binning and Attribute Analysis for Seismic and Navigation Data

Reflex Binning & Attribute Analysis

Reflex provides comprehensive binning and attribute analysis of seismic and navigation data in the marine, transition zone and land environments. The development of Reflex was largely influenced by the technical collaboration with the oil industry, which is an inherent feature of the majority of Concept's ongoing research and development activity.

Reflex is fast, flexible and easy to use, and delivers the high throughput of data necessary to ensure the best decisions can be made at the appropriate times. It offers a generous suite of facilities for qualitative and quantitative assessment of seismic coverage, together with detailed analysis of seismic and navigation attributes. The system is UNIX-based, and this enables it to take advantage of the ever increasing workstation capabilities.

Combined with Concept worldwide support and training facilities Reflex provides customers with the capability to improve the overall survey quality, and reduce costs. Reflex is used in a variety of survey environments, and can be integrated with other applications from Concept to ensure the operation is conducted in the most cost efficient manner.

High Data Throughput

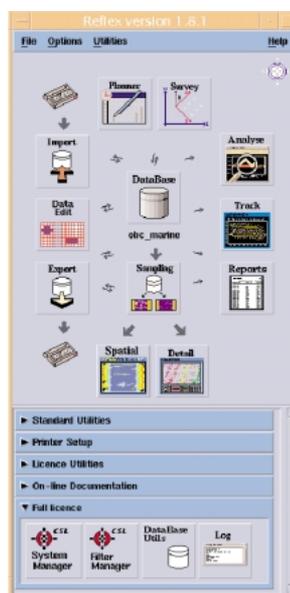

The Reflex data design provides high throughput of data, from UKOOA P1/90 or SPS to display. Lines are imported and sampled in a matter of minutes and are then ready for immediate display, either in isolation or, in a multi-line swathe or within the entire data set. In addition, all offset zones (eg near, mid, far) can be analysed at the same time. Sections of data can then be instantly examined for offset distribution or attributes or both.

Reflex's unique design then allows lines of coverage or attributes to be removed from or added to an existing display. This permits users to rapidly assess, for example, the contribution of infill.

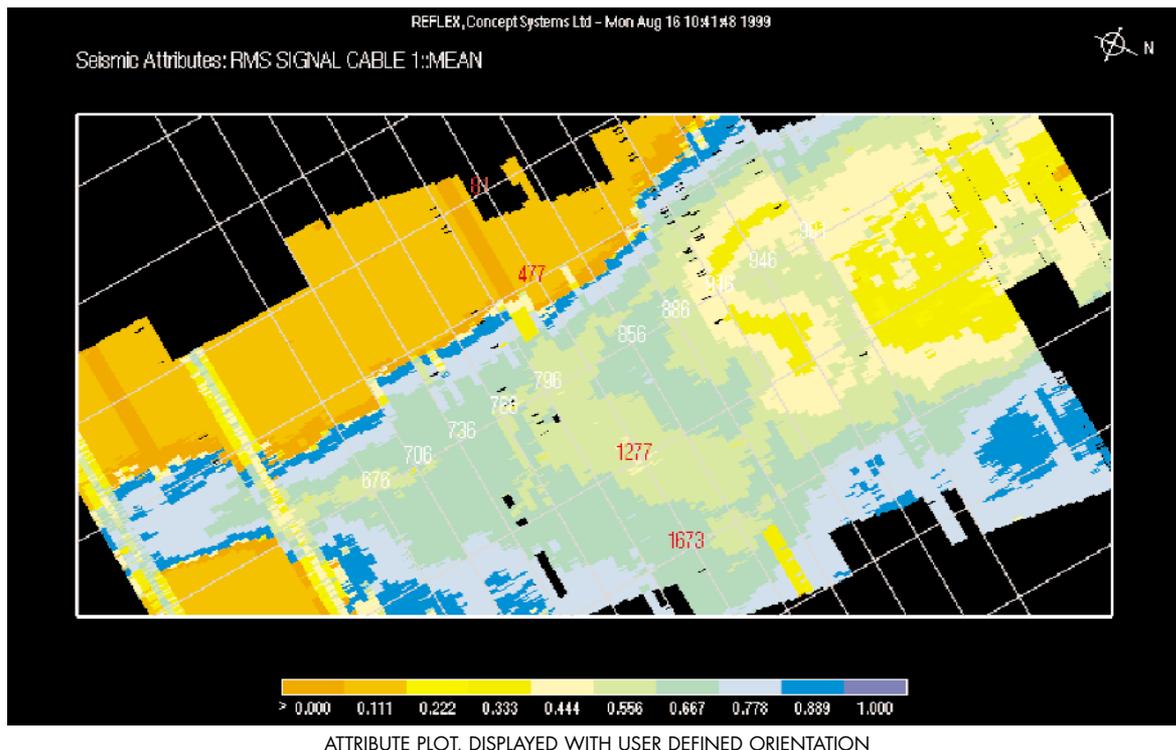

New data groups can also be easily incorporated as the survey progresses, eliminating the need for detailed pre-survey database planning.

Binning Techniques

Reflex can handle many bin expansion techniques such as linear and non-linear tapers. Its generic approach means that even the most complicated of specifications can be catered for. The use of source receiver offset based binning ensures true compatibility with seismic processing, for which Reflex can export a wide variety of data sets.

REFLEX MAIN MENU

It is possible to filter data before any processing by use of an attribute criteria statement. This can be composed of any logical combination of attributes, for example, to prevent noisy traces being binned. It can also be used to flag the "best" data for seismic processing.

A DMO capability is also included. As a result users can define a simple dip model and quickly generate a weighted DMO fold plot. The DMO analysis is extended so that the weighting can be examined on a per offset range basis.

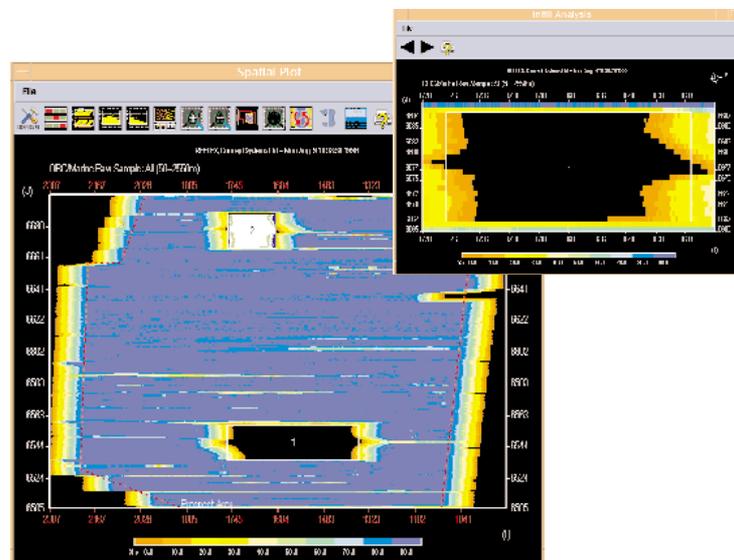

Reflex allows the user to perform converted wave binning. With the increase in importance of 4C surveys, this allows the analysis of CCP (Common Conversion Points) as well as CMP (Common Mid Points).

QC Facilities

Comprehensive QC facilities are provided throughout Reflex. Full SPS data format QC is available, allowing full QC of the shot, relation and receiver files. This eases the decision making process and allows the right decisions to be made as quickly as possible. A background audit trail records all significant activities for subsequent review.

Reflex's analysis of navigation and, more importantly, seismic attributes on a global basis allows identification of potential problems which may lead to difficulties during seismic processing. The data design lends itself to archiving such data sets for use in planning subsequent surveys.

Automatic detection of areas requiring infill allows fast and repeatable decisions to be made in the selection of infill.

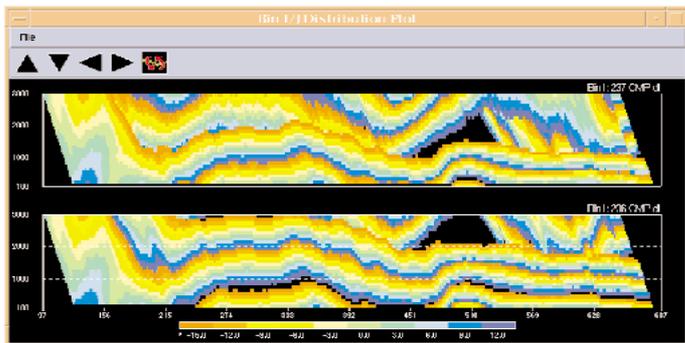

COVERAGE PLOT WITH INFILL DETECTION AND VIEWER INSET

Displays and Reports

A wide range of displays and reports is available, including:

- Track plot of any X, Y overlaid on bin grid.
- Spatial plot of coverage zones or attributes.
- Coverage filtered by user-defined spec (eg nears<80%)
- Offset distribution of any bin line.
- Overlaid offset distribution plot (using any attribute)
- Difference display as fold plot.
- Histograms of, eg coverage achieved to date.
- Detail plot showing individual CMP data
- A suite of general Postscript/HTML/Text reports.

OFFSET DISTRIBUTION PLOT WITH ATTRIBUTE OVERLAY

Reflex's bin detail plot interacts with the main Coverage/Attribute analysis display to show this information down to individual CMP level. In this way the reasons for any poor coverage are instantly identifiable, and appropriate steps may be taken to correct these. Difference plots are available between any two displays. Such difference plots may be analysed using Reflex's full detailed analysis functionality. In this way the net effect of infill or flex can be quantified simply in terms of actual offsets added. All displays are available as full resolution colour Postscript plots, in any size.

BIN DETAIL PLOT WITH MERGED MARINE/OBC DATA

Remote Analyser

The Reflex Remote Analyser makes it possible for a remote user to interact with the data, rather than just view previously generated plots. The data from the day's production for example can be sampled and compressed by the main system and sent via email or over a high-speed data link. The remote user can then access all the analytical capabilities of the main system.

Data Merge

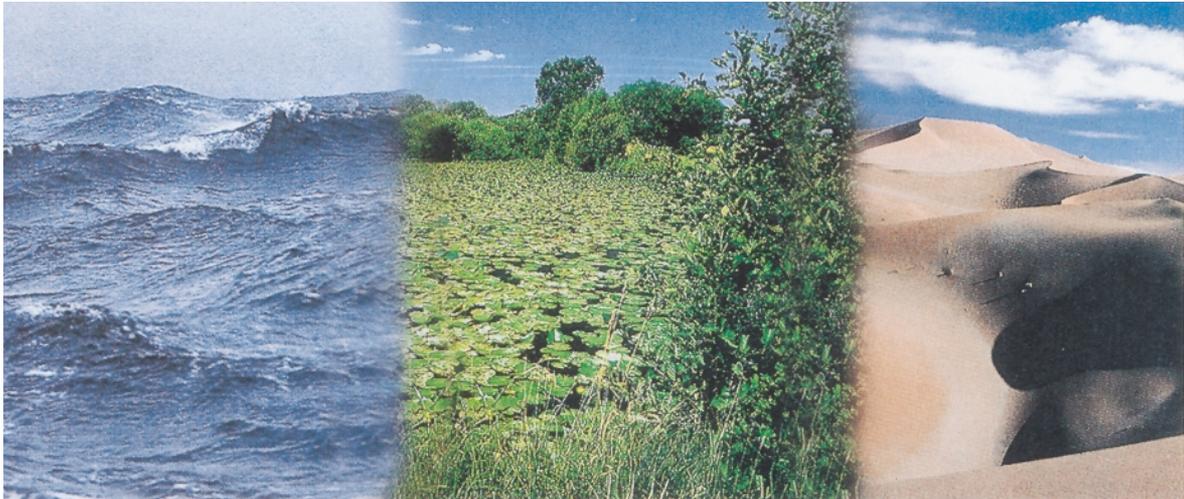

With many surveys today now involving the combination of streamer, bottom cable and land work, the ability to merge data from each environment is a major concern. Reflex handles such a scenario with ease, by enabling users to generate co-ordinate database(s) for each area and then sampling the data through a common definition. Users can see their entire prospect in one system and generate scaled maps for multi-client operations.

In addition, as ongoing surveys become extended in the field, requiring increased disk capacity, the merge capability can be used to analyse coverage from the extended area. This avoids any lengthy system reconfiguration/rebuilding.

Features

- Accepts industry standard data formats (UKOOA P1/90 and P2/91, SPS, Sprint, ProMax(TM))
- Rapid data access and manipulation
- Extensive bin expansion capabilities
- Filtering of data based on attribute criteria
- Attribute database archive for future use
- Analysis of offset and azimuth distribution at bin level
- QC and reporting facilities throughout
- Automatic Infill Detection
- Converted Wave Binning
- DMO modelling capability
- Output to seismic processing
- Built in audit trail
- On-line help
- Powerful remote analyser for off-site interpretation
- Available on multiple platforms including:
 - Sun (Sun OS, Solaris) • IBM (AIX)
 - HP (HP UX) • SGI

The Reflex Advantage

Reflex was designed with the full co-operation of oil companies and contractors to meet specific needs in the process of acquiring marine seismic and navigation data. Reflex was developed as a follow-up to the successful Sprint 3D project. Oil majors, BP Exploration, Mobil North Sea, Total Oil Marine and Phillips Petroleum UK, again collaborated in the project along with the UK Offshore Supplies Office, by providing technical and financial assistance. Throughout the design stage Concept Systems consulted closely with the seismic industry to ensure that user needs were wholly satisfied.

First introduced to the market early in 1995, Reflex has established a reputation with a number of contractors and QC operators for ease of use, speed and state of the art functionality. Concept Systems' continuing commitment to ongoing product development, responsive to customer feed-back, means that Reflex is sure to maintain its status as the leading product in the marketplace.

Benefits

- Infill decisions made quickly and correctly.
- Single system for integrating data from land, marine and OBC/TZ surveys.
- Attributes imported, analysed and archived for future use.
- Data management facilities assist with multi-client surveys.
- Guaranteed product longevity.
- Direct access to Concept Systems' expert worldwide support.

THE QUEEN'S AWARD FOR EXPORT ACHIEVEMENT
1997

Model 5011 Compass Bird

The Series 5000 Concept

The Series 5000 is the third generation of seismic streamer system components developed by Input/Output. The 5000 provides a platform on which various cable control products are based. Its modular construction allows common mechanical and electronic subassemblies to provide different cable control functions.

- Modular construction
- Non-corrosive outer body
- Supports a larger repertoire of features
- Dual-battery pack
- Multiple-processor architecture
- Communications to support 6000-m and longer streamers
- Multiple, watertight seals provide greater reliability
- 122-m (400-ft) depth measurement

Model 5011 DigiBIRD™

The Model 5011 is the DigiBIRD member of the 5000 family. It is an advanced, microprocessor-based device that is mounted externally on a marine seismic streamer cable. The DigiBIRD has a variety of functions and features, including:

- Compass heading information
- Heading data corrected for A, B, and C terms
- Internal filtering of heading data
- Depth measurement
- Depth control
- Adjustable, depth control, algorithm parameters
- Provides information to assist in ballasting streamers
- Non-magnetic outer body

Specifications

INPUT/OUTPUT, INC.

Physical Characteristics

Length	1.2 m (48.2 in)
Weight (in air)	8.32 kg (18.3 lb)
Weight (in sea water) with batteries	2.78 kg (6.1 lb)
Mounting	Industry-standard collars on 0.57-m (22.5-in) centers

Communications

Type	Serial, FSK
Frequency	26 kHz or 28 kHz
Data rate	2400 bit/s

Depth Measurement

Operating range	0 m to 122 m (0 ft to 400 ft)
Resolution	0.15 m (0.5 ft)

Heading Measurement

Accuracy	+/-0.5°
Resolution	12 bits

Diving Plane

Lift	15.9 kg (35 lb) @ 5 knots and 15° wing angle
Airfoil	NACA 651-012 Airfoil Section
Wing span	48.3 cm (19 in)

Battery

Cells	SLB 150 battery pack <i>standard</i> or 4, D-cell, lithium batteries <i>optional</i>
Life	150 days _{typ} for SLB 150 battery pack (<i>standard</i>) 60 days _{typ} for D-cell batteries (<i>optional</i>)

Limited Warranty Period

1 year

Model 452 Compass Interface

- Provides interface for 321 Compass when used in a seismic streamer
- Averaging time and sampling interval selectable
- Stores 'A' offset correction factor
- Communication with the DigiSCAN™ System and System 3™
- Monitors node voltage and signal-to-noise ratio

The Model 452 Compass Interface consists of a DigiSCAN modem and data acquisition circuitry which receives heading data from a single Model 321 optical compass, performs programmable data storage and manipulation, and transmits the conditioned data on request to the Model 272 or System 3 modem. The data is transmitted over a twisted pair transmission line. Power (provided by the Line Power Unit) is converted into voltages necessary for internal use in the 452 and the 321 optical compass.

**Operator Controllable
Parameters**

'A' offset correction
 Sample interval
 Averaging time

Environmental characteristics

Pressure rating 6,895 kPa (1,000 psi)
 Operating temperature -5°C to +35°C (+23°F to +95°F)
 Storage temperature -30°C to +65°C (-22°F to +149°F)

Physical characteristics

Weight 496.1 g (17.5 oz)
 Length 164.59 mm (6.48 in)
 Diameter 38.10 mm (1.50 in)
 Housing Stainless Steel
 Transmission line connection 2-wire feed through labeled "T"
 Connection 2-wire feed through labeled "C"

Electrical Characteristics

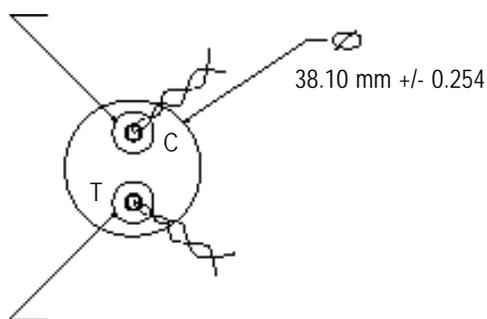

Diagnostics Node strength and signal to noise ratio
 Circuit protection Reverse polarity and overvoltage conditions
 Power consumption 120 mW typical
 Maximum number* of 452
 units per streamer 35 for 22 awg twisted pair
 25 for 24 awg twisted pair
 20 for 26 awg twisted pair

* Assumes 200 meters of lead in cable, and one 452 sensor per 100 meters, powered by I/O DigiCOURSE Sensor Interface Unit. Input/Output recommends using a dedicated twisted pair for the 452 units in the streamer.

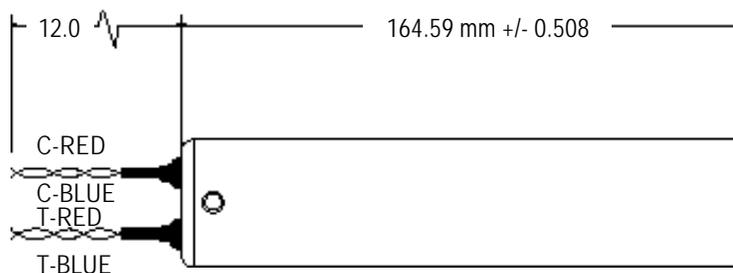

Data interface

DigiSCAN™ protocol 2400 baud FSK

Two-wire pass-through
(compass)

Two-wire pass-through
(transmission line)

- C-RED: 321 COMPASS +
- C-BLUE: 321 COMPASS -
- T-RED: TRANSMISSION LINE 1- DUAL FUNCTION, SIGNAL AND POWER
- T-BLUE: TRANSMISSION LINE 1- DUAL FUNCTION, SIGNAL AND POWER

NOTE: Each 452 unit should be installed in the streamer at least three feet from the nearest compass to prevent any possible magnetic distortion of heading readings.

Model 321 Heading Sensor

- 1.75-inch diameter
- 10,000-psi pressure rating
- 0.35° resolution
- 360° roll
- 47.5° pitch

The 321 is a precision instrument, providing accurate and reliable measurement under a variety of operating conditions of roll and pitch as well as those environmental conditions experienced in underwater towed array and seismic streamer applications.

The 1.75-inch diameter and 360-degree roll capability of the Model 321 enable it to meet nearly all seismic streamer applications while its 0.35-degree resolution supports today's accuracy requirements. With a maximum operation pressure of up to 10,000 psi, this sensor can be used in military towed arrays.

A ten-bit digital number, indicative of orientation relative to magnetic North, is latched and shifted serially in a 10-bit binary-gray word format. The two-wire interface provides both power and data, minimizing cable-wiring requirements.

Specifications

Performance Characteristics

Resolution °	0.35
Roll	360° <i>continuous</i>
Pitch	47.5°

Environmental Characteristics

Pressure rating	68,948 kPa _{max} (10,000 psi) _{max}
Operating temperature	-20°C to +55°C (□4°F to +13°F)

Electrical Characteristics

Output data frequency	1 kHz _{nom}
Power consumption	96 mW @ 20-Hz sample rate 9.6 mW @ 2-Hz sample rate
Output format	PWM, 10-bit, binary gray word

Physical Characteristics

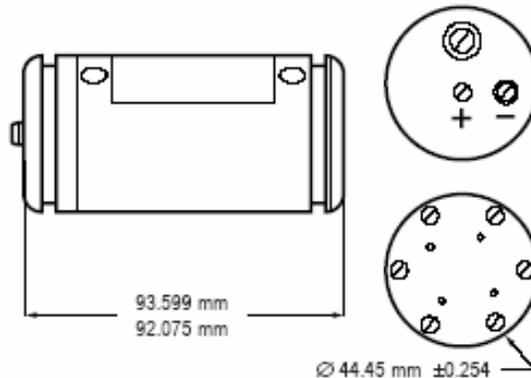

Length	92.84 mm (3.655 in)
Diameter	44.45 mm (1.75 in)
Weight	341 g (12 oz)
Housing	Anodized aluminum (tied electrically to COMMON return connection)

Model 483 Depth Sensor

- Operating range of 200 feet
- Depth accuracy $\pm 1.0\%$ of full scale
- Temperature accuracy $\pm 1.0^{\circ}\text{C}$
- Communication with DigiSCAN™ system

The model 483 is a precision instrument, providing depth and temperature measurements. The two-wire interface provides both power and data transfer, minimizing cable wiring requirements.

Specifications

INPUT/OUTPUT, INC.

Performance Characteristics

Depth resolution	11-bit
Depth accuracy	± 1% of full scale
Temperature accuracy	± 1°C (± 1.8°F)

Depth Operating Range

200 ft

Environmental Characteristics

Operating pressure rating	122 m (400 ft)
Survival pressure rating	6,895 kPa (1,000psi)
Operating temperature	-5°C to +35°C (+23°F to +95°F)
Storage temperature	-30°C to +65°C (-22°F to +149°F)

Physical Characteristics

Weight	510.3 g (18 oz)
Length	164.59 mm (6.48 in)
Diameter	38.10 mm (1.50 in)
Housing	Stainless steel
Electrical connection	Two-wire pass through
Pressure Interface	1/8 inch NPT female

Electrical Characteristics

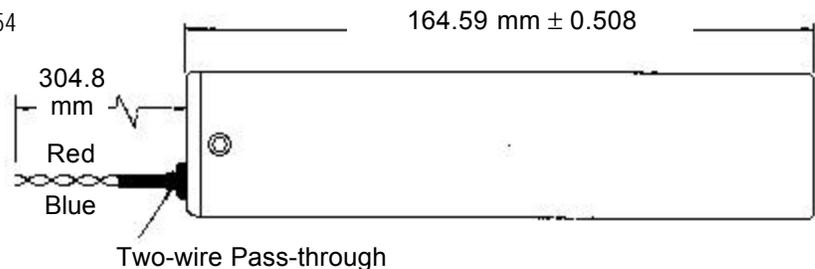

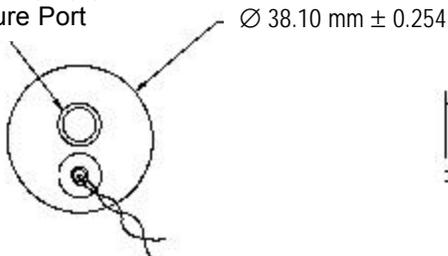

Circuit protection	Reverse polarity and overvoltage conditions
Power consumption	75 mW typical
Data interface	DigiSCAN™ protocol 2400 baud FSK
Maximum number per streamer*	50 for 22 awg twisted pair 40 for 24 awg twisted pair 30 for 26 awg twisted pair

(*) Assumes 200 meters of lead-in cable and one Model 483 sensor per 100 meters, powered by a serial interface unit. A dedicated twisted pair, in the streamer for Model 483 sensors, is recommended.

DigiRANGE™ Acoustic Ranging System Buoy/Source/Hull Mount (CTX)

- DSP based architecture provides an advanced signal set and detection method
- Designed for demanding seismic environments
- Advanced reflection detection and rejection algorithms
- Maximum range 1200 m
- Common Windows-based shipboard system supports depth control, acoustic and heading sensor measurements
- Efficient range creation capability
- Retry capability to improve completion rates
- Up to 600 two-way range measurements per shot interval
- Supported with Input/Output worldwide sales and service
- Modular package
- Multi power options

The DigiRANGE acoustic system provides observations of acoustic transit times between specific locations (nodes) on marine seismic streamers, tail buoys, energy sources, nav buoys and hull mounts. The system determines time measurements between nodes of the network with a resolution of 0.05 ms. Multiple streamer configurations and multiple vessel configurations are supported.

System		INPUT/OUTPUT, INC.	
Number of nodes	180 acoustic devices per system		
Instrument accuracy	0.1 ms		
Range resolution	0.05 ms		
Number of ranges per network	600 ranges per system (protocol limited)		
Host interface protocol	The ethernet host protocols provide for multiple, variable-length packets with support for up to 600 ranges with status information. Input/Output also supports the DigiCOURSE® standard and extended binary protocol in addition to other customer-defined protocols.

DigiRANGE II Acoustic Ranging System Streamer Mount (CMX)

4000 Series Design Concept

DigiCOURSE's business philosophy is to continually improve our products and create new innovated solutions for the seismic industry.

DigiRANGE II is the latest enhancement of the 4000 series platform. The modular design construction of the 4000 series systems allows for accurate, repeatable streamer positioning and control.

Model 4012/11/13 Acoustic Ranging System

The 4012 acoustic module is compatible with DigiRANGE acoustic technology thus improving positional accuracy, reducing in water range acquisition time and increased network density.

- Latest enhancement to DigiRANGE platform. Field upgrade kit available.
- New Advanced Digital Signal Processing algorithms
- Selectable automatic or manual threshold settings for optimized signal detection
- Intelligent device communication scheme allows for collection of 2800 ranges and communication up to 1200 devices within 6 second total cycle time
- Communicates to centralized Windows-based shipboard control and diagnostic system for depth control, acoustic positioning, heading, speed of sound and speed through water measurements
- Max range of 1200 meters
- Supports up to 20 streamers (mutli-vessel support)
- New light weight and rugged housing
 - Non-corrosive outer body
 - Low maintenance design
- Compatible with AcousticBird and DigiRANGE acoustic devices
- Compatible with DigiFIN steerage devices
- QuickCUFF™ compatible for rapid deployment and retrieval
- Compatible with DigiCOURSE FSK repeater technology for extended streamer deployments (up to 12 km)
- Worldwide 24 hour support and training

System		INPUT/OUTPUT, INC.

Model CMX-150 Battery Pack

- Model CMX-150 provides 150 days of typical in-water performance on the I/O CMX series of acoustic devices
- Reduces battery changes
- Life-time designed to match the new SLB-150 that is used in the Model 5000 Series Compass Birds
- Custom-designed to meet performance and safety requirements
- More efficient utilization of available energy

The model CMX-150 battery pack is a long-life battery for the cable-mounted, acoustic-ranging, I/O CMX units, giving approximately 2.5 times the life-time of the standard, alkaline, CMX battery packs. The design is intended to provide an in-water life-time that is comparable to the I/O Model 5010 Compass Birds when they are fitted with long-life SLB-150 batteries. The benefit of the CMX-150 and SLB-150 battery technologies is fewer battery changes for each device, further reducing time spent in the field and in changing batteries.

Model 293P Data Acquisition Unit

The 293P is a rack-mounted 32-bit personal computer with an Intel® Pentium® 90 MHz processor, 3.5-inch floppy disk drive, CD ROM drive, 540 MB hard disk and a 17-inch color, multi-sync resolution monitor. The 293P contains 24 megabytes of extended memory and operates with high level language commands. It contains two serial ports and one printer port, and acts as the system controller for communications with the host computer, the sensor units on the transmission line and the DigiSCAN™ graphics package. The 293P also serves as the operator interface (OI) in the System 3™ package which uses Windows NT® and an ethernet connection to the DMU and host computers.

Model 272 Streamer Interface Unit

The 272 is a standard relay rack mountable assembly containing the electronics necessary for interfacing the DigiSCAN™ streamer cable system to the shipboard computer. The assembly contains a modem board which collects data from sensors on the streamer and stores it in memory until retrieved by the computer. The 272 is also available with two modem boards as an option. Typically one modem board is required for each streamer.

Specifications

INPUT/OUTPUT, INC.

Dimensions	19 in (w) X 14.25 in (d) X 5.21 in (h)
AC power input	90 V to 132 V/180 V to 264 V, 50 Hz to 60 Hz
In/Out to streamer	Modem interface to streamer is via a male 3 pin connector located on the back side of the 272, one for each modem.
Interface with DAU	RS232, 25 pin
Exchange between 272 and host computer	
Commands from host computer	Address search/change/location set Individual station test/system run DigiBIRD™ depth control
Data to host computer	Compass heading Streamer depth Temperature at depth sensor location DigiBIRD control fin angle and battery usage
	Handshaking and protocol information for user programming of personal computer is available in the protocol section of the DigiSCAN™ Operator's Manual (6301-293A).

Multi-Channel Digital Streamer Tests

A series of basic daily tests, which perform detailed measurements of all the data acquisition modules and hydrophone groups, are carried out to ensure that the digital streamers are performing to specifications. These tests are as follows:

Amplifier RMS and DC Offset

Tests : Pre-amplifier noise and DC offset correction

Set-up : Pre-amplifier inputs grounded, output digitised

Analysis : RMS and mean of output calculated

Expected Values & Tolerances :

RMS Noise : Typical 4.5 μ volts, maximum 7 μ volts

DC Offset : Typical 6 μ volts, maximum 10 μ volts

(For 12 dB pre-amplifiers : different for 24 dB amplifiers)

Amplifier Impulse Response

Tests : Analogue filters

Set-up : Phones disconnected, one pre-amplifier input grounded, other pre-amplifier input driven with one-millisecond pulse, output digitised

Analysis : FFT of output calculated and three points examined

Expected Spectral Values & Tolerances (512 samples and 1 msec sampling) :

3.90625 Hz :	-2.0 \pm 0.5 dB	(Low Cut Out)
7.8125 Hz :	-4.0 \pm 0.5 dB	(Low Cut In)
31.25 Hz :	0.0 \pm 0.08 dB	(Mid-Band)
250 Hz :	-12.0 \pm 1.0 dB	(Analogue High Cut)

Channel Gain Accuracy

Tests : Pre-amplifier, filters, sample and hold, IFP amplifier

Set-up : Phones disconnected, one pre-amplifier input grounded, range of reference voltages applied to other pre-amplifier input, output digitised

Analysis : RMS calculation of output and comparison with expected values

Expected Values & Tolerances : Typical, 0.02% - maximum, 0.05%

Harmonic Distortion

Tests : Entire module, including analogue-to-digital converter

Set-up : Phones disconnected, one pre-amplifier input grounded, sinusoid of selected amplitude and frequency applied to other input, outputs digitised

Analysis : FFT of output calculated and harmonics of input sinusoid examined

Expected Values & Tolerances : < 0.02% distortion (for full or near full-scale signals)

Dynamic Resolution

Tests : IFP amplifier and analogue-to-digital converter

Set-up : Same as harmonic distortion, except full suite of amplitudes tested

Analysis : FFT of outputs calculated and harmonics of input sinusoid examined

Expected Values & Tolerances : < 0.02% distortion (for full or near full-scale signals)

Hydrophone Leakage

Tests : Hydrophone array

Set-up : Phones connected Inputs driven with step function Output digitised

Analysis : Leakage and capacitance of group calculated from phase of output

tolerances:

6.25 m Groups : 1 M Ω 0.128 μ F

12.5 m Groups : 499 k Ω 0.256 μ F

18.75 m Groups : 322 k Ω 0.384 μ F

25 m Groups : 249 k Ω 0.512 μ F

Output Options :

Pass/Fail (\pm 5% Tolerances)

Leakage and capacitance vs. channel

Time-series of output

Streamer RMS Noise

Tests : Hydrophone array; ambient acoustic noise

Set-up : Phones connected

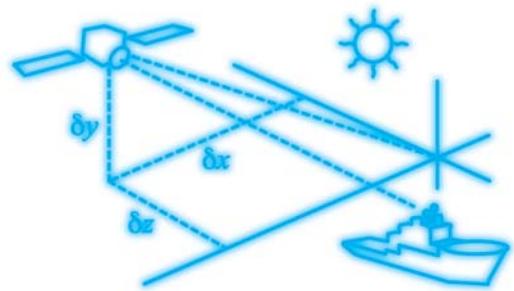

Analysis : RMS voltage calculated

Expected Values & Tolerances : Project-dependent

Positioning for Success

Ultra service

Veripos Ultra is the next generation positioning service from Veripos offering decimetre level position accuracy globally. The service is based around a positioning technique known as PPP (Precise Point Positioning) where all errors in the GPS system are either independently corrected or modelled to a high degree of accuracy.

Traditional differential GPS, generically referred to as relative positioning, relies upon reference stations, which derive corrections for each GPS satellite measurement that are then applied at the user end to cancel out common errors. Whilst this technique is very robust and well proven there are limitations, the main one being that as the users distance to the reference station increases, the accuracy decreases due to the errors becoming increasingly de-correlated.

In contrast to having a unique set of satellite corrections specific to each reference site, Veripos Ultra consists of one set of corrections for the satellites, which are valid globally. These are used at any location with no dependence on distance to reference stations.

Veripos Ultra delivers a high accuracy position using a proprietary PPP algorithm developed by Veripos that minimises or removes all of the main GPS errors sources such as satellite orbit, satellite clock, troposphere, ionosphere and multi-path.

Positioning for Success Ultra service

To carry out this absolute positioning technique orbit and clock correction information is broadcast for each and every GPS satellite to allow removal of satellite based error components.

Use of dual-frequency GPS hardware at the user-end permits the calculation and removal of local ionosphere errors, whilst troposphere delays are estimated within the calculation. Other sources of error are also modelled and include ocean loading, earth tides and phase windup.

To obtain the high-accuracy solution, multi-path and GPS receiver noise errors are minimised through use of carrier phase observables, which are precise to the millimetre level.

In all, Veripos Ultra provides a truly global, seamless high-accuracy position, which is not only robust but effective in all areas of operation, including areas of ionosphere disturbance.

Satellite Downlinks

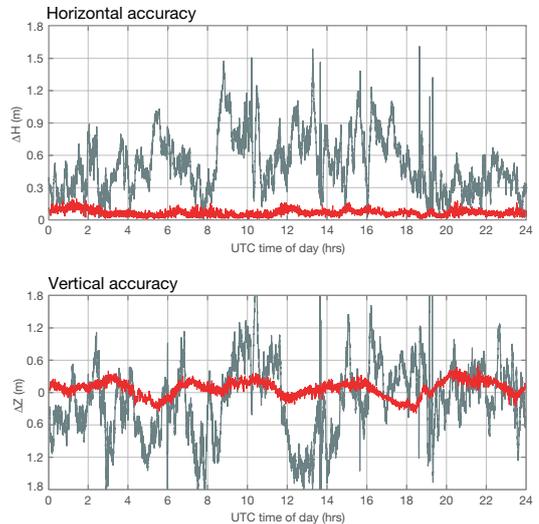

To ensure maximum reliability and availability, the Veripos Ultra service is broadcast globally from a suite of 7 L-band communication satellites, which cover the earth more than twice over. Two different power levels are broadcast; High-power (HP), which is received using a small omni-directional antenna and Low-power (LP), which requires a larger stabilised antenna such as a vessel's Inmarsat communication terminal. This configuration means that users can receive broadcast data from multiple sources giving excellent back-up and redundancy.

Correction Message

Veripos Ultra data is broadcast in a proprietary format to ensure transmission efficiency and maximum reliability. The message, which contains corrections to the broadcast GPS orbit and clock parameters for each of the current 32 satellites, repeats at a rate that is more than sufficient to prevent latency degradation.

Mobile Equipment

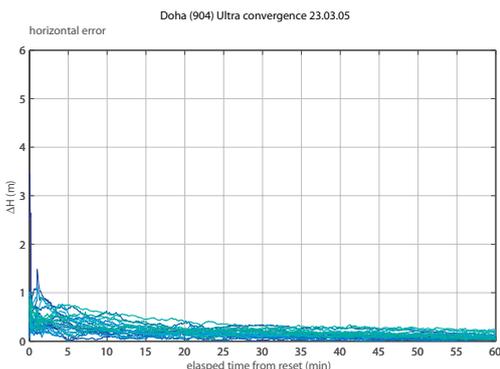

The Veripos Ultra position can be calculated in two ways; either directly inside the Veripos LD2 integrated mobile unit, or within Veripos' Verify QC software using data from the LD2. Alternatively, Verify QC can be used with an external Veripos demodulator and separate L1/L2 GPS receiver, should a user wish to utilise existing GPS hardware.

The above plots represent the horizontal and vertical position errors in Veripos Standard and Ultra solutions at a monitor site in Singapore. The reference station used in the Standard solution was located 322Km distant at Kemaman. The 2DRMS (95%) of the Veripos Ultra solution above is 0.05m horizontal and 0.29m vertical, whilst for the Veripos Standard solution above the performance is 0.56m horizontal and 1.41m vertical respectively.

Technical specifications:

- Process type: Precise Point Position (PPP)
- Observations used: CA & P code + L1 & L2 carrier phase
- Measurement rate: 0.6 seconds
- Availability: Worldwide
- HP satellites: Inmarsat 25E, 98W, 109E
- LP satellites: Inmarsat AORE, AORW, IOR, POR
- Data format: Modified RTCM SC104 Type 44
- Message types: 44
- Transmission rate: 1200 bps
- Typical data update rate: 30 seconds
- Normal Horizontal accuracy: 20cm (2DRMS)
- Normal Vertical accuracy: 30cm (2DRMS)

This plot shows the time taken for the Veripos Ultra position to initialise and converge to full accuracy. This example is based upon data for a 24-hour period at a site in Doha, MiddleEast. The system is completely reset every hour. 50cm accuracy is achieved after just 10 minutes, 25cm after 15-20 minutes and 10-20cm after 30 minutes.

Positioning for Success

Standard Plus service

Differential GPS relies upon the cancellation of common errors measured at two separate locations. The greater the proximity of the locations, the higher the degree of similarity of measurement errors and subsequent cancellation. As the separation between sites increases the errors will begin to de-correlate leading to residual biases in position.

The main cause of this is the differing path of the satellite signal through the atmosphere, and in particular, the ionosphere. During normal ionosphere conditions these delays are usually similar over relatively wide areas and so largely cancel out in the differential process, especially with the assistance of a good model. When the ionosphere becomes more active such as during periods of heightened solar activity its composition can change significantly, leading to large variations in its effect on signals over small areas.

During these periods such errors may not cancel out between sites and models may become inaccurate leading to sizeable errors in differential positioning.

Positioning for Success Standard Plus service

The level of ionosphere disturbance is correlated with the following:

Solar activity (sunspot/magnetic storms). Increased ionosphere activity linked with the 11 year solar cycle (present cycle peaked in 2001).

Geographic location: Highest activity along geomagnetic equator and in the auroral regions;

Seasonal variations: Increased activity at the Vernal and Autumnal Equinoxes;

Diurnal (daily) variations: Maximum effects normally experienced one hour after local sunset until midnight.

There are two symptoms of ionosphere activity on DGPS:

- Position errors caused by failure of the differential process to cancel the effects of ionosphere delays.
- Scintillation - which causes rapid fluctuations in the phase and amplitude of the satellite signal as it passes through the ionosphere. During peaks of activity, scintillation can become so severe that it is simply not possible to track signals.

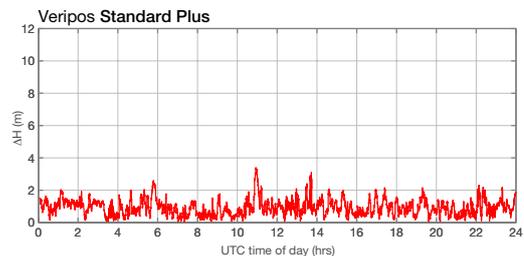

Veripos Standard Plus is an addition to the Veripos Standard service and is designed to help address these symptoms by using dual-frequency GPS. Using observations on both L1 and L2 frequencies allows the mitigation of the position errors by calculating, instead of modelling, the ionosphere delays in each satellite signal, and thereafter removing its effects. In addition to the normal pseudo-range corrections transmitted in the Standard service, measured ionosphere delay information for each satellite at each reference station is also broadcast.

This information, which is available in standard RTCM format (message Type 15) as well as a range of other formats, is then combined with the locally measured values to give a position, free from the effects of the ionosphere. As the ionosphere is changing relatively slowly, a fast update rate for the corrections (Type 15) is not required.

The problem of scintillation, however, is much more serious as the signal may be too disturbed to use or could even be absent.

Although extremely difficult to fully compensate this effect, Veripos Standard Plus can provide some improvement through using latest GPS technology as well ensuring the highest quality installations to minimize signal losses.

Veripos Standard Plus is a premium service that can provide significant improvements in operational performance & efficiency under these challenging conditions.

The above plots represent the horizontal position error in Veripos Standard and Standard Plus solutions at a monitor site in Malongo. The reference station was located 1265Km distant at Port Harcourt. The de-correlating effect of the ionosphere, which can be clearly seen in the single-frequency Standard solution, has been fully compensated in the Standard Plus solution. The 2DRMS (95%) of the Veripos Standard solution above is 6.14m horizontal, whilst for the Veripos Standard Plus solution the performance is 0.98m horizontal.

Technical specifications:

Process type: Single difference (DGPS)
Observations used: CA & P code, L1 & L2 carrier phase
Measurement rate: 0.6 seconds
Availability: Brazil, West Africa, SE Asia
(other locations available on demand)
HP satellites: Inmarsat 25E, 98W, 109E
LP satellites: Inmarsat AORE, AORW, IOR, POR
Data format: RTCM SC104
Message types: 1, 3, 15 & 16
Transmission rate: 1200 bps
Typical Type 1 correction update rate: 7 seconds
Typical Type 1 latency: 2 seconds
Typical Type 1 average age of correction: <5 seconds
Typical Type 15 correction update rate: <60 seconds
Normal accuracy: Up to 2000Km: 1-2m (2DRMS)
Ref station co-ordinate frame: ITRF00

C-NAV DGPS

PRECISION ACCURACY ◦ WORLD-CLASS RELIABILITY
GLOBAL CUSTOMER SERVICE 24/7 ◦ REDUNDANT SYSTEM BACKUPS

TAKE A CLOSER LOOK AT C-NAV:

C-NAV IS A NEW CONCEPT IN GPS POSITIONING WHERE THE ACCURACY AT THE MOBILE LOCATION IS NO LONGER A FUNCTION OF THE DISTANCE FROM THE REFERENCE STATION(S).

- 1-decimeter horizontal and 3 decimeters vertical accuracy for ultra-precise positioning.
- Dual-frequency processing resolves user-location errors in C-Nav's single worldwide signal.
- Multiple-redundant regional backup systems support the worldwide signal.
- Simple three-part hardware is easy to install, rugged and reliable.
- Global 24/7 customer service when and where you need it.

THE C-NAV RTG NETWORK IS A GLOBAL SYSTEM FOR THE DISTRIBUTION OF DIFFERENTIAL GPS CORRECTIONS, GIVING THE USER THE ABILITY TO MEASURE HIS POSITION ANYWHERE IN THE WORLD WITH EXCEPTIONAL RELIABILITY AND UNPRECEDENTED ACCURACY OF 10 CM (4 INCHES) OR BETTER. BECAUSE THE DIFFERENTIAL GPS CORRECTIONS ARE BROADCAST VIA INMARSAT GEO-STATIONARY SATELLITES, THE USER NEEDS NO LOCAL REFERENCE STATIONS OR POST-PROCESSING TO GET THIS EXCEPTIONAL ACCURACY. FURTHERMORE, THE SAME ACCURACY IS AVAILABLE VIRTUALLY ANYWHERE ON THE EARTH'S SURFACE ON LAND OR SEA FROM 72° N TO 72° S LATITUDE DUE TO THE WORLDWIDE COVERAGE OF THE GEO-STATIONARY SATELLITES.

INFRASTRUCTURE

The system utilizes the DoD NavStar GPS Network, L-band communications satellites, and a worldwide network of reference stations to deliver real-time high-precision positioning.

To provide this unique service, NavCom has built a global Network of dual-frequency reference stations, which constantly receive signals from the GPS satellites as they orbit the earth. Data from these reference stations is fed to two Processing Centers in Redondo Beach, CA and Moline, IL where they are processed to generate the differential corrections. From the two Processing Centers, the correction data is fed via redundant and independent communications links to satellite uplink stations in Laurentides, Canada, Goonhilly, England and Auckland, New Zealand for uplink to the geo-stationary satellites, which broadcast it globally.

The key to the accuracy and convenience of the Network system is the source of DGPS corrections. GPS satellites transmit navigation data on two L-band frequencies. The Network reference stations are all equipped with our geodetic-quality, dual-frequency GPS receivers. These reference receivers decode GPS signals, and send precise high quality dual-frequency pseudorange and carrier phase measurements back to the Processing Centers together with the data messages, which all GPS satellites broadcast.

At the Processing Centers, NavCom's proprietary differential processing technique, developed under license from the NASA Jet Propulsion Laboratory (JPL) from the JPL Real Time Gypsy (RTG) software, is used to generate differential correction data for each satellite in the GPS constellation. This proprietary wide-area DGPS (WADGPS) algorithm is optimized for a Network in which dual-frequency ionospheric measurements are available at both the reference receivers and the user receivers. It is the use of dual-frequency receivers at both the reference stations and the user equipment together with the advanced processing algorithms, which makes the exceptional accuracy of the C-Nav system possible.

Creating the differential corrections is just the first part. From our two Processing Centers, the differential corrections are then sent to the Land Earth Station (LES) for uplink to L-band communications satellites. Each L-band satellite covers more than a third of the earth, providing global coverage between 72° N to 72° S.

Users equipped with a Network precision GPS receiver actually have two receivers in a single package, a GPS receiver and an L-band communications receiver, both designed by NavCom for this system. The GPS receiver tracks all the satellites in view and makes pseudorange measurements to the GPS satellites. Simultaneously, the L-band receiver receives the correction messages broadcast via the L-band satellite. When the corrections are applied to the GPS measurements, a position measurement of unprecedented real-time accuracy is produced.

RELIABILITY

The entire system meets or exceeds a target availability of 99.99%. To achieve this, every part of the infrastructure has a built-in backup system. All the reference stations are built with duplicate receivers, processors, and communication interfaces, which switch automatically or in response to a remote control signal from the Processing Centers. The data links from the reference stations use the Internet as the primary data link and are backed up by dedicated communications lines, but, in fact, the network is sufficiently dense that the reference stations effectively act as backup for each other. If one or several fail, the net effect on the correction accuracy is not impaired.

There are two Processing Centers located geographically distant from each other and running continuously, each receiving all of the reference site inputs and each with redundant communication links to the uplink sites (LES). The Land Earth Stations are equipped with two complete and continuously operating sets of uplink equipment arbitrated by an automatic-fail overswitch. Finally, a comprehensive team of support engineers maintains round-the-clock monitoring and control of the system.

The network is a fully automated self-monitoring system. To ensure overall system integrity, an independent integrity monitor receiver, similar to a standard StarFire-user receiver, is installed at every reference station to monitor service quality. Data from these integrity monitors is sent to the two independent processing hubs in Torrance, CA and Moline, IL. Through these integrity monitors the network is continuously checked for overall DGPS positioning accuracy, L-band signal strength, data integrity and other essential operational parameters.

C-NAV DGPS

The C-Nav2050 sensor consists of a 10-channel dual-frequency precision GPS receiver, two additional channels for receiving Satellite Based Augmentation System (SBAS) signals and an L-Band demodulator for reception of C-Nav correction service. The sensor can output raw data as fast as 50Hz and Position Velocity Time (PVT) data as fast as 25Hz through two 115kbps serial ports.

THE C-NAV2050 FAMILY OF RECEIVERS:

- The **C-Nav2050G** provides 64MB internal memory for data storage and provides the user with up to 5Hz measurement and position solutions. In addition, optional 10Kz and 25Hz Fast Positioning Update rates are available as well as raw data measurement outputs at 10Hz, 25Hz or 50Hz.
- The **C-Nav2050M** has all the standard features of the C-Nav2050G plus a 1PPS output port and a combined Event/CAN Bus interface port. In addition, 25Hz Fast Position Update rate is available and optional raw data measurement outputs up to 50Hz, and optional RTK Position Velocity and Time (PVT) solution at up to 5Hz are available.
- The **C-Nav2050R** has all the standard features of the C-Nav2050G but provides for two L-Band signal connections, one for the Dual Frequency GPS antenna and the second for a hi-gain L-Band communication satellite antenna.

The C-Nav2050 GPS family of receivers provides survey positioning services on a global basis.

C-NAV2050 GPS HARDWARE

TECH SPECS

FEATURES

- "All-in-view" tracking
- Global decimeter-level accuracy using RTG corrections
- Fully automatic acquisition of satellite broadcast corrections
- Configurable for global L-band satellite coverage – RTG, WAAS, EGNOS
- Rugged and lightweight package for mobile applications
- Accepts external GPS correction input in NCT, RTCM v2.2 or CMR format
- L1 & L2 full wavelength carrier tracking
- C/A, P1 & P2 code tracking
- User programmable output rates
- Minimal data latency
- 2 separate SBAS (WAAS/EGNOS) channels
- Superior interference suppression
- Patented multipath rejection
- Supports NMEA 0183 v3.01 messages
- Self-survey mode (position averaging)
- CAN bus interface (C-Nav2050M only)
- 1PPS Output (C-Nav2050M only)
- Event Marker (C-Nav2050M only)

PHYSICAL/ENVIRONMENTAL

- Size (L x W x H): 8.18" x 5.67" x 3.06" (20.8 x 14.4 x 7.8 cm)
- Weight: 4 lbs (1.81 kg)
- External Power
 - Input Voltage: 10 VDC to 30 VDC
 - Consumption: <10 W
- Connectors
 - I/O Ports: 2 x 7 pin Lemo
 - DC Power: 4 pin Lemo
 - RF Connector: TNC (with 5 VDC bias for antenna/LNA)
- Temperature (ambient)
 - Operating: -40° C to +55° C
 - Storage: -40° C to +85° C
- Humidity: 95% non-condensing
- Tested in accordance with MIL-STD-810F for: Low pressure, solar radiation, rain, humidity, salt fog, sand and dust, and vibration

PERFORMANCE

GPS RECEIVER PERFORMANCE

- Real-time Kinematic Accuracy (RTK Option Only)
 - Relative position: Centimeter level
- Real-time StarFire DGPS Accuracy
 - Position (H): <10 cm
 - Position (V): <30 cm
 - Velocity: 0.01 m/s
- Pseudo-range Measurement Precision (RMS)
 - Raw C/A code: 20cm @ 42 dB-Hz
 - Raw carrier
 - Phase noise: L1: 0.95 mm @ 42 dB-Hz
 - L2: 0.85 mm @ 42 dB-Hz
- User Programmable Output Rates
 - PVT: 25Hz, 10Hz, 5 Hz, 2Hz, 1Hz, or slower
 - Raw data: 50Hz, 25Hz, 10Hz, 5Hz, 2Hz, 1Hz, or slower
- Data Latency
 - PVT: < 20 ms at all nav rates
 - Raw data: < 20 ms at all rates
- Time-to-first-fix
 - Cold Start, Satellite Acquisition: < 60 seconds (typical)
 - Satellite Reacquisition: < 1 second
- Dynamics
 - Acceleration: up to 6g
 - Speed*: < 300 m/s
 - Altitude*: < 60,000 ft
- 1PPS Resolution 12.5nS (C-Nav2050M only)

*Restricted by export laws

I/O CONNECTOR ASSIGNMENTS

- Data Interfaces: 2 serial ports; from 1200 bps to 115.2 kbps
CAN Bus I/F (C-Nav2050M only)
Event Marker I/P (C-Nav2050M only)

COMMUNICATIONS PORT FUNCTIONS

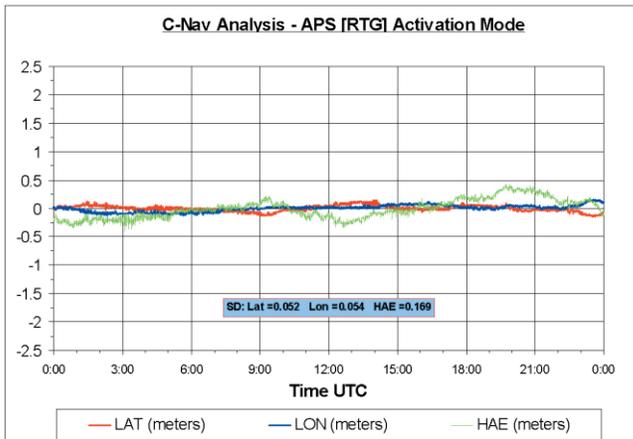

- NCT Proprietary: Data, Control
- RTCM I/O: Code Corrections
- NMEA Output: Data

INPUT/OUTPUT DATA MESSAGES

- NCT Proprietary
 - Data: PVT
Raw Measurement
Satellite Messages
Nav Quality
Receiver Commands
- NMEA Messages (Output): ALM, GGA, GLL, GSA, GSV, RMC, VTG, ZDA, and GST
- Code Corrections: RTG (proprietary) – Internal LBM
WCT (proprietary) – Internal LBM
SBAS (WAAS/EGNOS) – Internal GPS
DGPS (RTCM Type 1 or 9) – External I/O
RTK (RTCM, CMR, NCT)

LED DISPLAY FUNCTIONS (DEFAULT)

- Link (Selectable)
- Base Station
- GPS Position Quality

Simrad EA 500

Hydrographic Echo Sounder

The hydrographer's must !

The Simrad EA 500

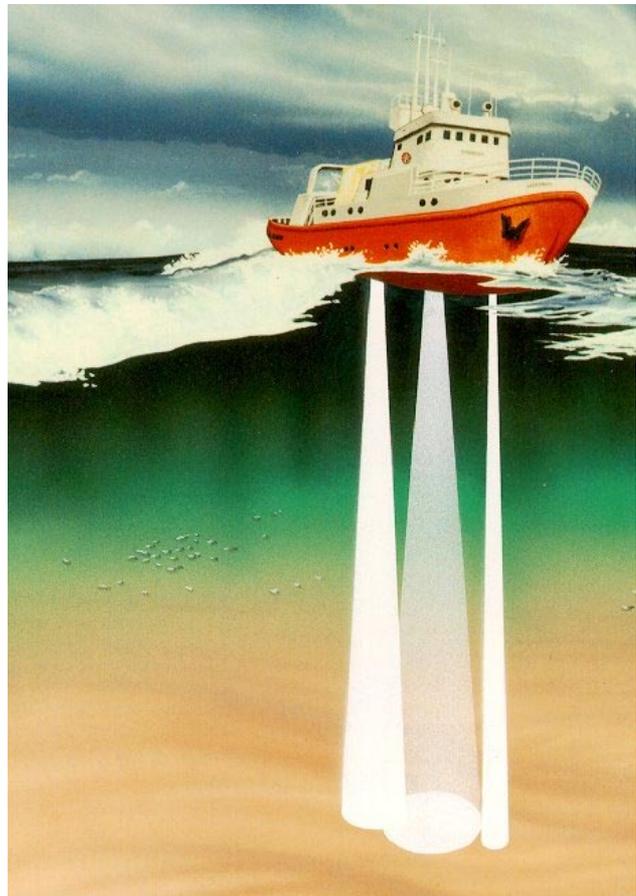

...is a modular triple channel hydrographic echo sounder, where extensive microprocessor technology combines the resolution of "the good old analogue sounders" with the benefits of a modern electronic echo sounder.

...is the first hydrographic echo sounder with 160 dB instantaneous dynamic range - the strongest and the weakest signal will be detected, stored and displayed without degradation.

...is the first hydrographic echo sounder with split beam transducers - measuring true inclination angles of the seabed in athwartships direction.

Unique EA 500 features

- Triple frequency operation
- Separate digitizer for each channel
- High transmitted power
- Pinger mode
- Extensive self-test functions
- Powerful multiprocessor system
- Multipulse operation, several pulses in the water simultaneously
- Sophisticated software algorithms for bottom tracking based on multi-criterion decision theory
- A wide range of transducers, single beam or split beam, or side-looking
- Split beam operation measuring bottom athwartships inclination angle
- Adjustable ping rate up to 10 pings/second

KONGSBERG
SIMRAD

- Digital data output for later postprocessing
- Ethernet interface type IEEE 802.3
- Remote computer command control
- Echogram presentation in 12 colours
- Menu-driven operation
- Uncomplicated push-button/joystick control
- Interface to heave, roll and pitch sensors
- Sound velocity compensation (manual or profile input)
- Navigation data input
- Annotation: data input or automatic
- Event marker input
- Pinger mode
- Deep water stabilized version, electronic beam control

Optional features

- Analyzing capabilities for silt measurements and sub-bottom profiling
- PC/workstation-based software for a variety of postprocessing and plotting purposes

- Side-looking channels
- Multichannel operation, 3x64 channels

Technical specifications

Operational range

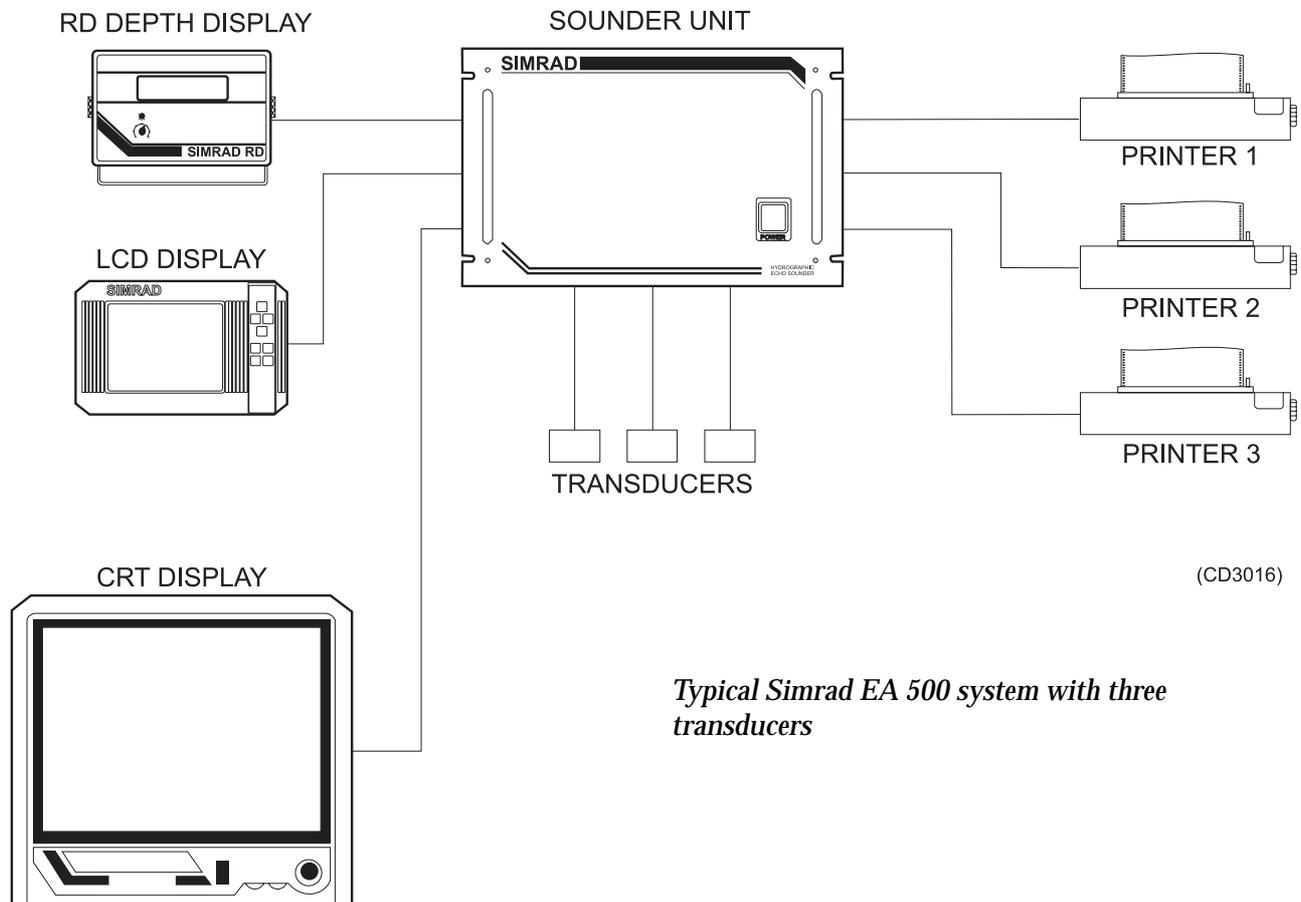

..... 1, 5, 10, 15, 25, 50, 100, 150
250, 500, 750, 1.000, 2.500, 5.000
and 10.000 m

Phasing

..... 0-10000 meters in
1-meter increments,
manual or automatic

Display and recorders

- 1, 2 or 3 echograms shown simultaneously on each device
- Individual echogram setting for each device
- Colour scale related to true bottom surface scattering coefficient
- Ping rate: Adjustable, max 10 pings/second
- Sound velocity profile: Automatic input from probe via RS232C /Ethernet interface or manually entered

Typical Simrad EA 500 system with three transducers

- Navigation input data: Programmable format (NMEA 0183 included)
- Language menu: English, norwegian, french or german
- Output data: Programmable composition of telegrams (RS 232C and/or Ethernet)

Transmit and receive

Output power

regulation 0 to -20 dB
relative to full power
(-3 dB, -23 dB selectable by jumpers)

Nonsaturated instantaneous

input range -160 dB to 0 dB
(dB relative to 1 W)

Noise figure 10 dB

Terminal impedance: 60 ohms

Voltage and power

Supply voltage 187 - 264 Vac 50/60 Hz
90 - 132 Vac 50/60 Hz
21 - 31 Vdc

Power consumption 100 W (one channel)
125 W (two channels)
150 W (three channels)

Environmental specifications

Operating temperature 0 - 55 deg C

Physical dimensions, Transceiver

Width 480 mm

Height 310 mm

Depth 440 mm

Rack Fits in 19" rack

Weight, max configuration 40 kg

Measurement resolution

cm <_ 999,99 m

dm > 1.000 m

m > 10.000 m

Measurement accuracy

Similar to sample distance when sound velocity profile is correct.

Menu operation

Manual operation of the sounder is based on a menu system which to a large extent is self-explanatory. A keypad or joystick is used for command entry. The menus are organized in a tree structure similar to the directories of a modern computer operating system, with the current menu shown on the display.

Menu overview:

Operation

General purpose operation parameters

Display

- Controls echograms and alphanumeric information on the display

Recorder 1 and 2

- Controls echograms and alphanumeric information on the recorders (separate menu for each recorder)

Transceiver

- Menu for transceiver parameters

Bottom detection

- Controls the operation of the bottom detection algorithms

Navigation

- Controls the interpretation of input data from navigation receiver (NMEA 0183 included), position, speed and external clock.

Ethernet communication

- Controls the composition of data telegrams•

Serial communication

- Controls the composition of RS232 output data telegrams

Annotation

- Comment string and event marker control

Motion sensor

- Conversion constants characterizing the heave/roll/pitch sensor

Sound velocity

- Automatic or manual loading of sound velocity profile

Utility

- Beeper, status messages, set EA500 internal clock etc, or external clock.

Test

- Production testing, service testing, calibration

Transducers

For selection of frequency and transducer, we recommend to use 70% of the theoretical depths in the table below, in order to obtain a reasonable safety margin and automatic bottom detection. The table below is based on an assumption of a backscatter strength of -10 dB.

Transducer	Type	Sounder Transmit Power	Max. Depth (m)						
			70	500	630	1800	3200	4500	8100
12kHz Single	12 - 16	2 kW	[Shaded bar from 70 to 13000]						
18kHz Single	18 - 11	2 kW	[Shaded bar from 70 to 8100]						
27kHz Single	27-26/21	2 kW	[Shaded bar from 70 to 4500]						
38kHz Single	38-7	2 kW	[Shaded bar from 70 to 3200]						
49kHz Single	49-26	2 kW	[Shaded bar from 70 to 1800]						
120kHz Single	120-25	1 kW	[Shaded bar from 70 to 630]						
200kHz Single	200-28	1 kW	[Shaded bar from 70 to 500]						
710kHz Single	710-36	50 W	[Shaded bar from 70 to 70]						

(CD494)

Sercel Vims

TUS Guardian Solid Streamer

GUARDIAN

The 3rd Generation Solid Seismic Streamer

Solid Streamer Timeline

- 1982 TMS BEGINS DEVELOPMENT OF SOLID MILITARY ARRAY
- 1992 "FAST TRACK" PROJECT
- 1994 SENTRY DEVELOPMENT
- 1995 PROTOTYPE SEA TRIALS / INITIAL 400 SECTION ORDER
- 1996 FULL PRODUCTION RAMP UP
- 1997 START CONTINUOUS IMPROVEMENT PROGRAM
- 1998 START GUARDIAN R&D
- 2000 OVER 500KM OF SENTRY SOLID SECTIONS PRODUCED IN THREE SYSTEM COMPATIBILITIES.
- 2001 START GUARDIAN PRODUCTION - FIRST OPERATIONAL VESSEL 12/01

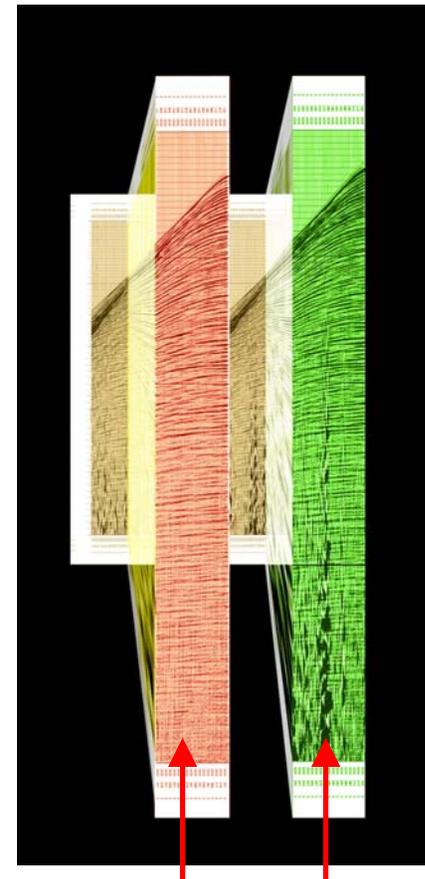

Key Guardian Benefits

- Superior acoustic performance
 - Increased productivity through wider weather window
 - Superior data quality
- Robust solid streamer design and construction
 - Repairable on-board repair
 - Reduces downtime and on board spares
- Consistent and constant modular buoyancy
 - Eliminates balancing problems and reduces setup
 - High resistance to in-water damage
- Environmentally Sound
 - Able to operate in environmentally sensitive areas

Extending the Weather Window

- Superior Acoustic Performance
 - Streamer self-noise less than 2.5 microbars RMS in sea states of 1M or less
 - Streamer self-noise less than 5.0 microbars RMS in sea states of 3M or less
 - All individual hydrophone performance verified in manufacturing and repairs

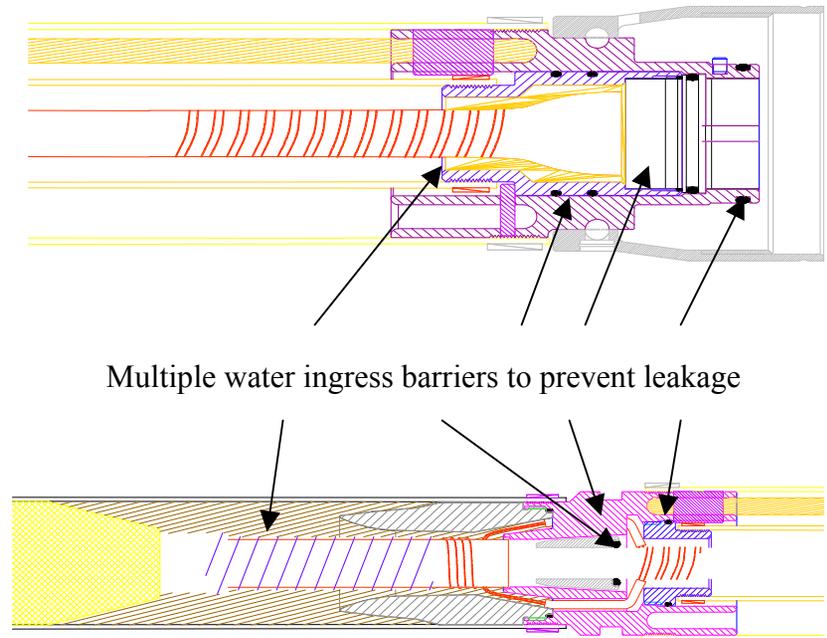

TUS
Solid
Streamer

Oil
Filled
Streamer

Robust Design Yielding Productivity Increases

- 3rd generation design coupled with a culture of continuous improvement has resulted in new standards for streamer reliability
 - Reduces downtime and onboard spares
- Guardian was designed for onboard maintenance

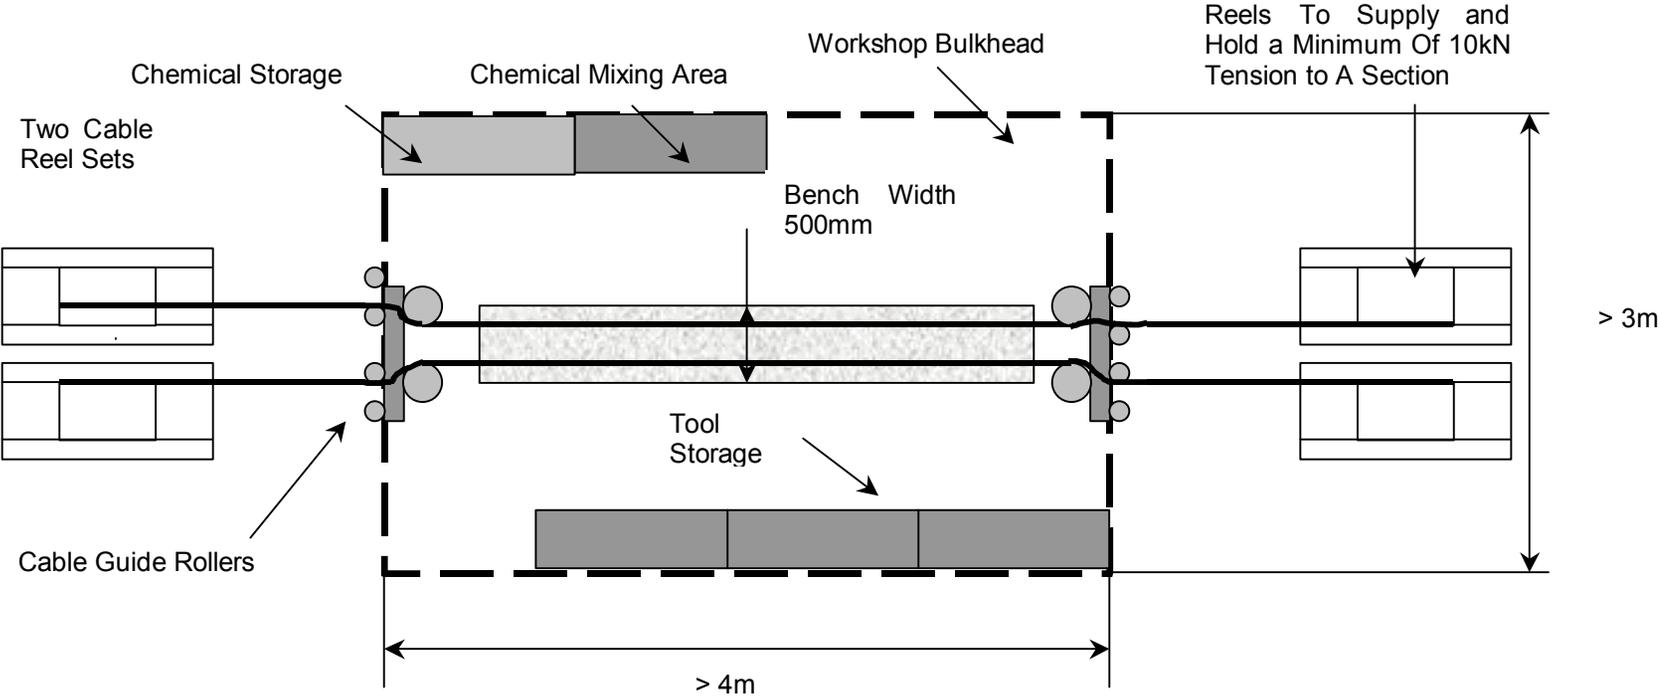

Guardian Onboard Repair

- Guardian was designed to support onboard maintenance
 - Eliminates the time and logistics effort to send off cable for repair thereby fully utilizing your investment
- A complete set of tools, spare parts and documentation in place for field support
- Solid streamer repair training available at any TUS facility or onboard your vessel

Guardian Onboard Repair Capability

Guardian: Consistent and Constant Buoyancy Control

- Consistent and constant buoyancy provides productivity benefits during deployment and operation
- Guardian delivered ballasted to customer specifications
- Durable polymer resistant to impact damage.
- In-field adjustment achieved using external clip on weights.
- Low compressibility with depth.

Guardian Specifications

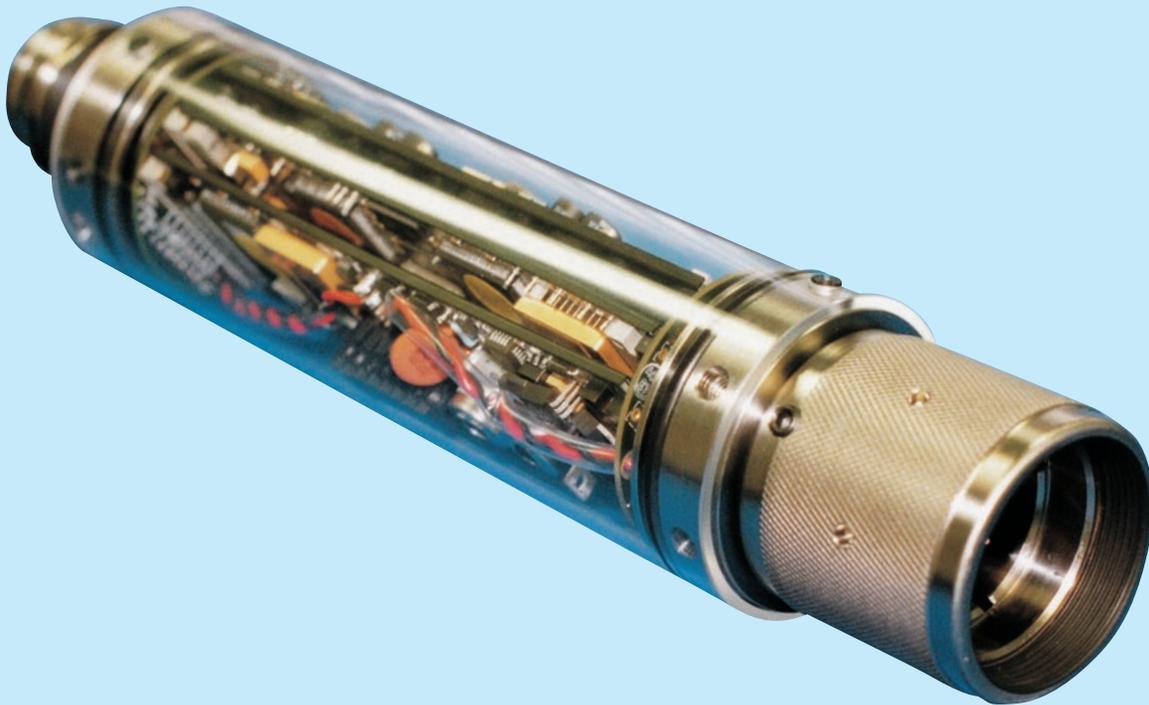

- **System Compatibility:** SYNTRAK®
MSX™
- **Sensor Type** TUS TS014 or TS020
- **Section Diameter** 57.5 mm (2.25 in)
- **Section Length** 100/150 meters
- **Streamer Length** Up to 12,000m
- **Strength Member** Aramid Fibre
- **Communications Coils** FSK and / or PRO2000
- **Flotation Material** Polyurethane matrix
- **Operating Temperature Range** -10°C to + 55°C

Improving Your Seismic Image

- Experience the benefits of Guardian Solid Streamer
 - Superior Acoustic Performance
 - Industry Leading Reliability Standards
 - Consistent and Constant Buoyancy
 - Environmentally Sound
 - World-wide Support

SCUTM (Streamer Communications Unit)

- Reliable communications to >12 km
- One SCU for every 4 km of cable
- SCU control link for troubleshooting and status
- Battery backup for continued communication in the absence of cable power
- Two repeater channels per SCU

SCUTM (Streamer Communications Unit)

Sercel's Streamer Communications Unit (SCU) extends communications even in ultra-long streamer applications. The SCU boosts bird and compass communications beyond the typical 6- or 7-km limit achievable in towed arrays. Two separate communications lines are supplied.

Extended cable length allows data collection that enhances imaging of sediments below high velocity basalts and sub-basalt structures. And not only do ultra-long cables allow a larger amount of more accurate data to be collected, they make this data collection less costly. An ultra-long cable allows a single boat to do what used to require combinations of at least two recording boats in a single pass or a gun boat and recording boat in multiple passes. The exorbitant cost and difficult-to-merge resultant data make these methods undesirable. Sercel's SCU makes them unnecessary.

The SCU is built into a standard 24-bit Data Acquisition Module housing, but its circuitry is completely different from the standard module.

Powered from the cable, the SCU also has a rechargeable battery that can power the unit for one to four days after cable power is cut off.

The SCUs have analog repeaters, handling both FSK and PSK transmissions and therefore have negligible delay affecting acoustic timing units. One repeater is required for every four kilometers of distance from the controller.

A built-in ghost communications system allows a PC with a simple RS485 interface adapter (supplied) to query the SCUs for operational status and battery state and to place the units in bypass mode for troubleshooting. Units that have shut down because of low battery power also fail-safe into bypass mode. An external charger can keep the batteries in several spare units ready to go.

The SCU is usable with both 16-bit and 24-bit SYNTRAK systems.

Specifications

Repeater Interval	4 km
Signal Delay	25 μ s maximum
Repeater Channels	2

STUTM (Streamer Tension Unit)

- Measures streamer drag in real time
- Protects investment in streamers and electronics
- Readings up to 100 kNt or 10,000 daN (22,000 lbf)
- Battery backup provides data in the absence of streamer power

STUTM (Streamer Tension Unit)

Sercel's streamer tension unit (STU) means improved protection of your in-water assets. The STU measures stress on towed arrays and also gives the operator more control over data acquisition by providing critical information for determining the safest maximum vessel speed for towed components. Sercel's STU is a risk management tool that improves productivity.

The STU's primary task is to provide real-time streamer tension measurements to the operator. This means that the operator is immediately notified when a streamer is under excessive strain, which can easily occur when making turns, working in heavy seas or strong currents, or when seaborne materials such as seaweed, marine growths and snagged fishing gear add drag.

Functionally, the STU is an instrumented module that measures in-line tension up to 22,000 lbf (100 kNt). The accuracy is $\pm 5\%$ of reading, or ± 100 lbf (445 Nt), whichever is greater. Using a communications pair of wires in the streamer, the STU transmits continuous tension data that indicate the real-time tensile load on the streamer. Although most useful near the head of the streamer, multiple units may be located

within a single streamer to give stress readings at different points.

The STU has a companion controller that resides on the vessel and handles STUs on up to 16 streamers. Controller features for real-time monitoring and recording include average and peak displays, graphs, and recorded files.

Although powered by the streamer, the STU telemetry is completely independent from the streamer telemetry. A rechargeable battery inside the STU provides data telemetry for 16 hours after streamer power is cut off. And an external charger can keep the batteries in several spare units ready to go.

Compatible with both 16-bit and 24-bit SYNTRAK systems, Sercel's STU can improve efficiency on any marine seismic spread.

Specifications

Maximum Tension	10,000 daN (22,000 lbf) (100 kNt)
Accuracy	$\pm 5\%$ or ± 45 daN (100 lbf)
Number of Streamers per Controller	16

RADIAL STRETCH

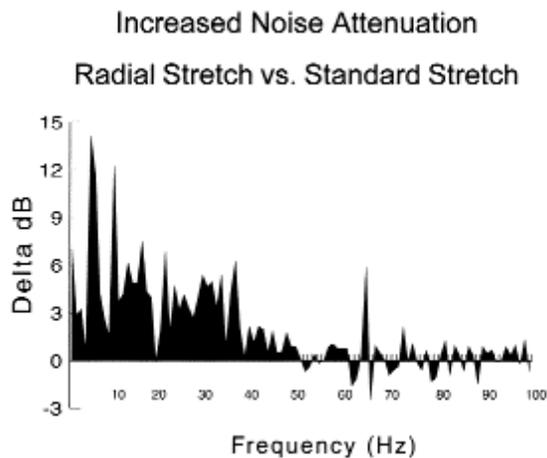

- Twice the vibration isolation
- Improved ruggedness
- Reduced streamer noise
- Reduced seismic offset
- Electrical or optical telemetry
- Tows 12-km active lengths

RADIAL STRETCH

Sercel's Radial Stretch sections are rugged. Constructed with the same technology that is used to manufacture radial tires, these sections provide extra durability exactly where it is needed - at the front of the streamer where the loads, stresses, and mechanical abuse are the greatest. But that's not all. The radial stretches provide twice the vibration isolation per meter as conventional rope-type stretch sections. This allows a reduction in seismic offsets for the same amount of isolation.

These benefits all derive from the unique construction of the Radial Stretch. The vulcanized rubber skin provides the ruggedness to survive the harsh streamer front-end environment, but because the radial rubber skin carries the streamer load, it also provides the basis for the superior elongation characteristics that result in the superb vibration isolation.

Radial Stretch sections have internal vectran snubber ropes that protect them from excess loads by load sharing. Radial Stretch sections have been used successfully with streamers up to 12,000 meters long. They are available with both electrical and optical telemetry.

Specifications

PHYSICAL

Length	25 meters (82.02 ft.)
Overall Diameter	4.6 in. at ends, 3.7 in. at center
Weight	178 kg (392.4 lb.) in air
Maximum Towing Load	4,500 Kg (10,000 lb.)
Rated Breaking Strength	10,000 Kg (22,000 lb.)

SNUBBER SETTING

High Load	1800 Kg (4,000 lb)

Gun Controller System

(Click on highlighted text to open relevant file. Click “previous document” arrow, as shown, to return to this document)

The attached pdf-format files provide information on the gun controller systems and gun types.

Sercel GCS-90

Bolt Long-Life Airguns

GCS90™

- Configurable for 8 to 96 guns in 8-channel increments
- Digitized resolution - 8 bits at 0.1-ms intervals
- Fire command output resolution at 0.1-ms intervals
- 0 to 60 dB adjustable gain control of each sensor input
- Configurable sensor termination
- Color graphical display of timing information
- User configurable array geometry
- Auto-fire detection
- Rugged Eurocard form
- Hard copy printout of shot statistics and signature graphics

GCS90TM

The GCS90 Gun Controller System is a wise buy! It is compatible with all types of airgun sources used in seismic operations today, and it provides the most cost-effective and reliable firing control and monitoring for all of them.

The SPS90 Solenoid Power Supply provides sixteen channels of high voltage suitable for firing various energy sources. The power supply unit is powered by either 110 Vac or 220 Vac. Voltage settings of 60, 90, 120, 150 and 180 volts can be supplied. Optional voltages of 40, 50, 60, 70 and 80 are also available.

The Gun Depth Transducer System is the most reliable on the market, providing accurate depth readings for seismic sources for up to 32 gun transducers. The two-wire, frequency modulated devices are mounted closely to the energy source and continuously report depth to the boat.

Specifications

GCS90 SOURCE CONTROLLER SYSTEM

Processor	INTEL X86-based
DRAM	32 Mbytes
Hard Disk	IDE drive, 1.4 Gbytes
Floppy Disk	1.44 Mbytes 8.89 cm (3.5")
Software	DOS (applications written in C Language)
Serial Ports	Two
Parallel Ports	One

CYCLE CONTROL BOARD

Interface Channels	Timebreak output, trigger input, two AUX inputs, two AUX programmable outputs, remote alarm output, auxiliary parallel output, data monitor input and output
Quality Control	Source signature sensor display, statistical reports, gun historical database
Configurations	Large gun arrays up to 96 guns, offset VSP

FIRE CONTROL BOARD

Processor	INTEL 80C31/12 MHz
A/D Converter	Maxim MAX158, 8 bits at 12.5-ms intervals
FCB Hardware	One FCB per each eight guns
Channel Trigger/Fire	
Control Resolution	0.1 ms
Channel Sensor	
Detection Resolution	0.1 ms

DEPTH MONITOR CONTROL BOARD

Minimum Data Acquisition Period	5 ms per depth transducer
Data Encoding	Frequency proportional
System controller	Resident within GCS90
Channels Maximum	32
Channels Measured	4 to 32 at one time
Pulse Width	25 ms
Range	0 to 40 m 0 to 131 ft of sea water 0 m = 6 kHz 40 m = 10 kHz

SPS 90 SOLENOID POWER SUPPLY

Power	110 Vac or 220 Vac
Channels	16 per unit
Voltage Selections	60, 90, 120, 150, 180 Optional 40, 50, 60, 70, 80
Fire Pulse Width	Manual - 25 ms Remote - received from GCS90 Gun Controller
Cable Length	60.96 m (200 ft) maximum
Controls	Arm/Safe Switch, Power Switch, Kill Switch
LEDs	1 per channel (illuminates when voltage is within 10% of specified voltage)

The Long-Life™ Air Gun

Long-Life™ Technology Solution

During the early 1990s, the marine seismic industry began to develop larger and substantially more complex multi-streamer vessels capable of efficiently acquiring vast amounts of 3D seismic data. Bolt Technology Corporation introduced the *Long-Life™* Air Gun in 1991, in response to demands by seismic contractors for a stable high endurance energy source that would match the efficiency of these vessels. The *Long-Life™* design has resulted in air guns that consistently produce 500,000 or more trouble-free shots before requiring significant maintenance.

Since March of 1993 Bolt Technology Corporation has sold in excess of 4,800 *Long-Life™* Air Guns, which equates to more than three fourths of the Western World's seismic fleet. The following diagram illustrates the principle features of the *Long-Life™* Air Gun.

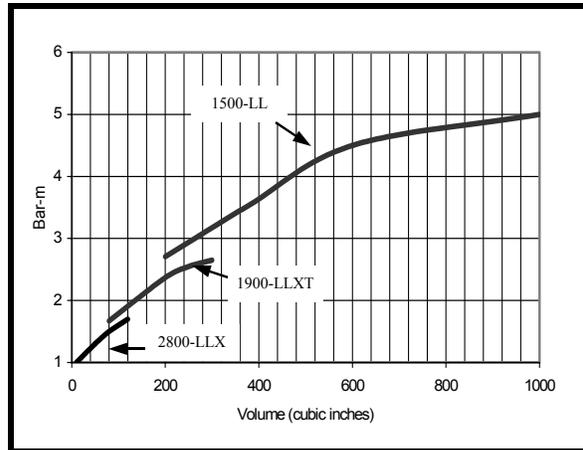

▲ 1500-LL *Long-Life™* Air Gun

The *Long-Life™* Air Gun is available both as a completely new gun or as an upgrade kit for conventional 1500CT and 1900CT Bolt Air Guns.

High Acoustic Output

A combination of increased throat area and improved shuttle speed has resulted in a significant improvement over conventional Bolt Air Guns in both peak output and peak-to-bubble ratio. The following graph illustrates peak output vs. chamber volume for Bolt *Long-Life™* Air Guns, measured through an Out-128 Hz filter.

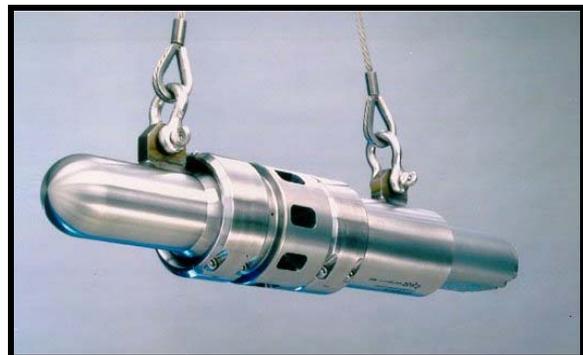

▲ Peak Output vs. Volume (Out-128 Hz Filter)

The *Long-Life™* Air Gun is available in three models spanning volumes from 5 in³ to 1,500 in³.

2800-LLX

The 2800-LLX Air Gun is designed for volumes ranging from 5 in³ to 120 in³. The gun is very light-weight, and is ideally suited for shallow water source vessels with limited deck space. For maximum energy output, it can be easily configured in 2-gun and 3-gun cluster elements.

▲ 2800-LLX Air Gun

1900-LLXT

The 1900-LLXT Air Gun is designed for volumes ranging from 10 in³ to 250 in³. The gun is extremely versatile, and is sufficiently lightweight for shallow draught vessels while powerful enough for blue-water seismic surveys.

▲ 1900-LLXT Air Gun

1500-LL

Due to its large throat area, the 1500-LL Air Gun is capable of generating very high peak output with the excellent low-frequency content associated with large chamber volumes. Using heavy-duty cluster spreader bars, it is possible to configure cluster elements in excess of 1,000 in³ without sacrificing peak output.

▲ 1500-LL Air Gun

The 1500-LL Air Gun produces the highest peak output over the largest range of chamber volumes. The gun can be configured with chamber volumes ranging in size from 40 in³ to 1,500 in³. Large chamber sizes require heavy duty towing frames to withstand the shock generated by the gun.

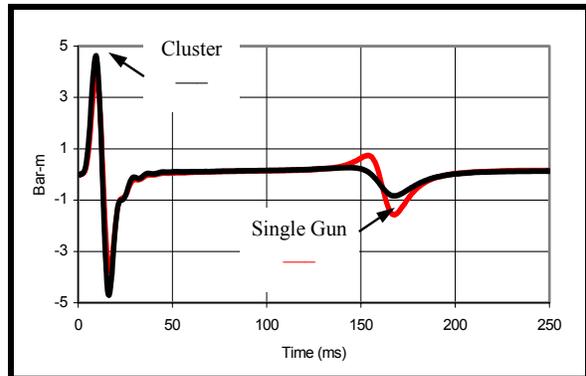

1500-LL 2-Gun Cluster

The preceding graph illustrating Peak Output vs. Volume for Bolt Air Guns clearly shows the effect of throat limitation on output. For each model of Air Gun, there is a volume limit beyond which the normal increase in output with volume is diminished.

▲ 2-Gun Cluster Frame (2 x 300 in³)

A solution to this problem is found in Bolt's heavy-duty cluster spreader bar assembly. The increase in peak output for the 2-gun cluster compared to a single 600 in³ is shown in the following far-field signatures.

▲ Single 600 in³ vs. 2 x 300 in³ cluster

The far-field signature clearly shows the 20% improvement in efficiency that results from a 2-gun cluster compared with a single 600 in³ air gun.

Carefully engineered and thoroughly tested, Bolt's *Long-Life*[™] Air Gun has proven to be the marine seismic industry's most reliable source for a decade.

Bolt's worldwide leadership as a supplier of seismic energy sources has been maintained by an on-going commitment to research and development. Bolt Technology Corporation prides itself in a long tradition of service to our customers.

The company's commitment to service and excellence is demonstrated by extensive quality control procedures and tests. In addition to in-plant inspection, Bolt maintains an extensive test facility where each marine, land and bore-hole air gun is rigorously tested under conditions which simulate actual applications.

▲ Aerial View of Bolt's Test Facility

Bolt is committed to being the premiere supplier of seismic energy sources for geophysical exploration.

▲ Bubble Venting from a 9000 in³ Air Gun at 10 m. depth

Integrated Navigation System for Marine Geophysical Survey

SPECTRA

Integrated Navigation System for Marine Geophysical Survey Operations

The Leading Integrated Seismic Navigation System

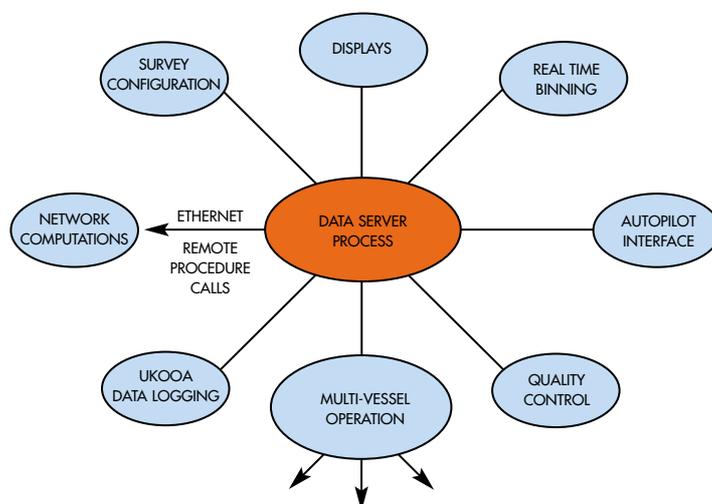

SPECTRA is a comprehensive integrated seismic navigation system with a modular design allowing customers to quickly reap the benefits of any innovations in navigational techniques.

With approval from all major oil companies and used fleetwide by the majority of leading seismic contractors, Concept Systems provide 24 hours system support and are committed to a policy of continuous improvement to keep pace with ever increasing positioning and quality control demands. Allied to Concept's Sprint and Reflex products, SPECTRA provides customers with a potent package for cost-effective on-board integrated navigation, incorporating position quality control, navigation processing and binning to meet diverse industry needs. It is an inherently flexible and scalable product, capable of quickly adapting to the dynamic of change within the industry.

SPECTRA Architecture

SPECTRA is based on an expandable network of Unix workstations with a dedicated real time navigation sensor acquisition system. Any number of workstations (IBM, SUN, HP) can be networked providing flexible configurations to meet individual customer needs ranging from simple 2D operations and 3D High-Res applications to complex 3D multi-vessel, multi-streamer surveys.

The design of SPECTRA is based around a central Data Server process which acts as the information bank and data broker for the system. Data produced by the system's producer processes (whether configuration, raw measurement or positional solution data) are stored by the data server and made available on demand to the

consumer processes providing logging, display and quality control functionality.

This modular architecture allows flexible system expansion while keeping reliability as new enhancements are included.

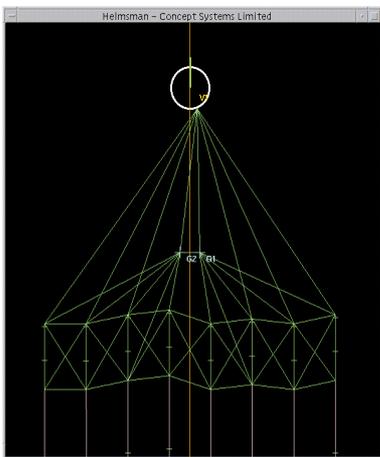

A software interface library is available which allows straightforward communication to the data server with user developed programs.

NAVIGATORS DISPLAY

Network Computations

Any number of different network topologies can be configured and solutions are provided from Network Calculation Node (NCN) processes, one for each network. Raw navigation data is timestamped to UTC time on acquisition by the Real Time Navigation Unit (RTNU). The raw data is passed to the NCN's whose Kalman filter implements the transformation from the observation domain to the state domain.

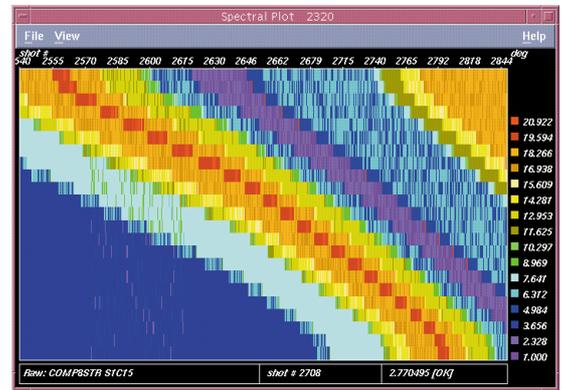

FRONT END NETWORK

The Kalman filter implementation provides the advantage that a network can still solve using an incomplete data set where a normal least squares solution could fail.

Rigorous statistical testing or data snooping provides immunity to observation spikes and blunders. DGPS and RGPS recomputation from satellite pseudo ranges with associated quality control information is also provided via the Satellite Positioning process.

UKOOA Data Logging

SPECTRA provides real-time logging of UKOOA P2/91 and P2/94 file format as well as processed P1/90 format. Multiple data logging processes can be activated for additional security and data integrity. Data can be logged directly to a variety of peripheral devices including disk and tape. A number of DGPS and RGPS receivers can be interfaced to provide Pseudo range, Ionospheric, UTC, Almanac, Ephemeris data and RTCM corrections

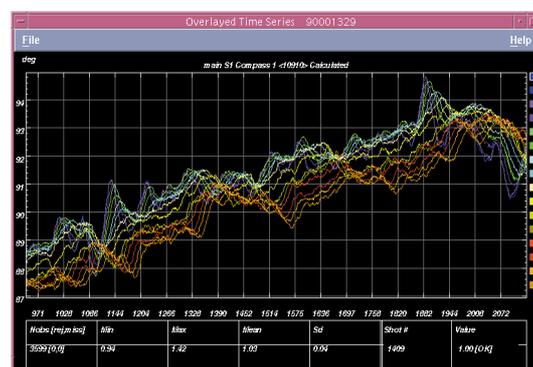

COMPASS SPECTRAL PLOT

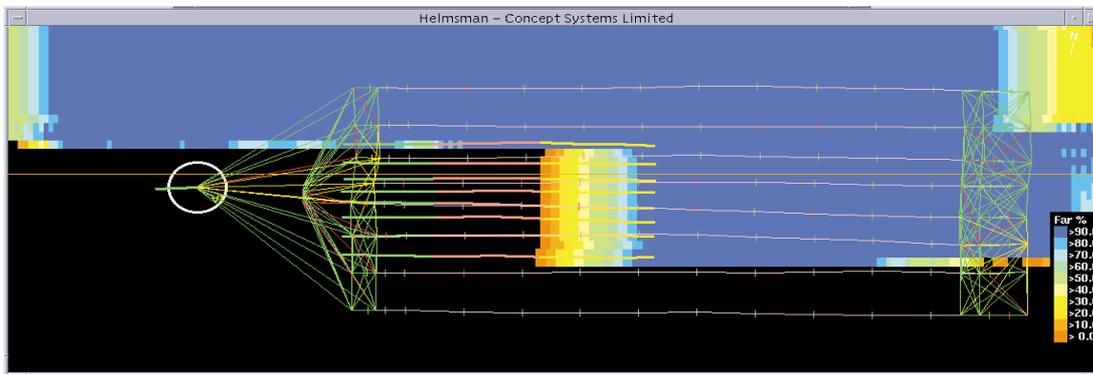

for complete P2/94 logging. Logged P2/91 and P2/94 can be replayed and the resulting data re-logged to P2/91, P2/94 and P1/90 formats.

Quality Control

The Quality Control Logging process can be configured by the user to log raw navigation data, network solution and network quality parameters to disk. The Quality Control process can be used to analyse the logged data post acquisition or in real-time. Extensive alarm and audit facilities meeting UKOOA quality guidelines are provided to alert the user to possible problems or confirm data integrity. The Quality Control process can display various types of statistical plots including, spectral plots, histograms, standard time-series, difference time-series, multiple time-series and overlaid time-series allowing comparison of several data items. Customised end of line reports can be configured which are available for output in postscript format for printing. Various spreadsheets and attribute formats compatible with other software packages, eg. Reflex, Promax are also available.

COMPASS OVERLAY TIME SERIES

REAL-TIME BINNING DISPLAY

Real-Time Binning

SPECTRA provides extensive real-time binning facilities. Bin grid parameters including offset distribution, coverage zones, flex binning parameters and individual zone colour scales can be passed from Reflex or entered directly into SPECTRA via the Binning Configuration process.

Multiple displays can be configured with fixed aspect ratios, CMP lines and selected zones. Coverage display files can be raw, i.e. logged directly from SPECTRA, or processed coverage received after binning in Reflex. Processed coverage files automatically take precedence over raw files.

Multi-Vessel Operation

SPECTRA is designed to control sophisticated multi-vessel surveys. Each slave vessel is configured to run with a data server and basic system.

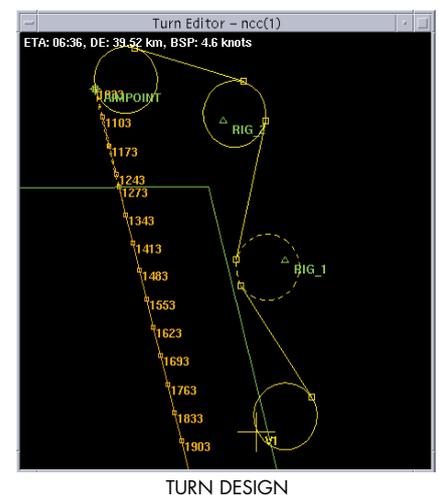

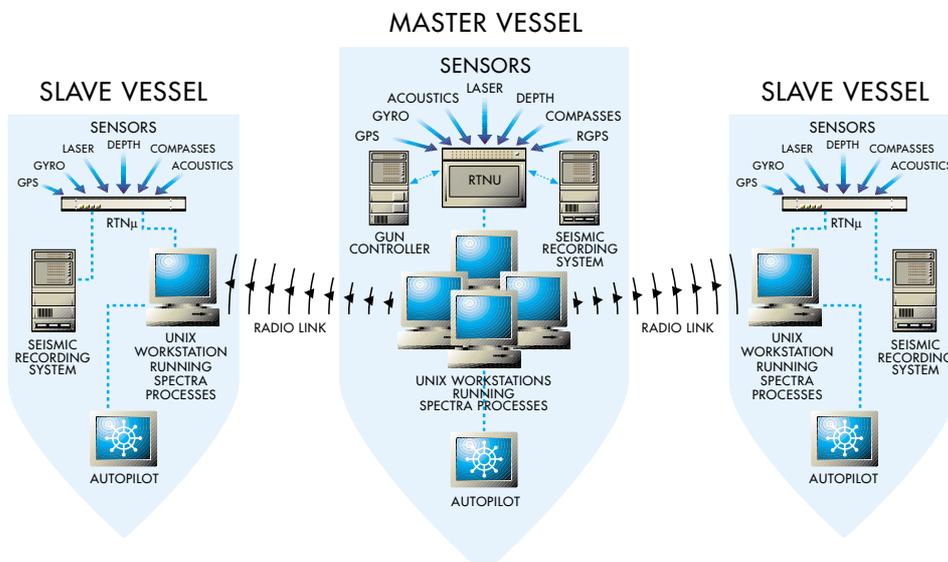

Communication between vessels is provided by the Data Transfer process. This process provides an intelligent link which is robust enough to deal with communication interference and temporary failure. The master vessel provides the overall configuration

and data logging facilities. The slave vessel can be equipped with Real Time Navigation Micro Units (RTN μ) which allow independent operation when isolated from the master vessel, eg. during cable work. The use of RTN μ 's on the slave vessel allows synchronisation of gun controller and seismic recording systems to 50 micro-seconds. Slave vessels can be stationed relative to the master vessel using the Bullseye Configuration process controlled from the master vessel. Different online and offline parameters can be provided and the slave vessels can be positioned relative to the master vessel or the current sail line.

Autopilot Interface

SPECTRA can be interfaced to the vessel autopilot and is controlled from the instrument room by the navigator. Graphical and text displays are available to provide simple and concise information to the helmsman. The autopilot interface is also fully compatible with SPECTRA's comprehensive turn planning and steering facilities. This functionality provides the user with optimum efficiency in timesharing and line change situations.

MULTI-VESSEL CONFIGURATION

TURN DESIGN

Key Benefits

- Navigation acquisition and validation with real-time source and streamer positioning for marine seismic surveys ranging from simple 2D and high resolution requirements to extensive 3D multi-streamer, multi-vessel configurations.
- Distributed data server provides simple connectivity to easily configure multi-vessel surveys.
- Real-time data acquisition units with integrated GPS receiver provide triggering to 50 micro-seconds, allowing remote synchronisation of seismic and acoustic systems.
- Real-time binning, CMP and offset distribution with bin expansion capabilities.
- Data logging to UKOOA P1/90, P2/91 and P2/94 standards with full redundancy providing confidence in data integrity.
- Quality control process providing alarm and audit facilities meeting UKOOA guidelines. Extensive on-line graphical analysis facilities and end of line reporting facilities.
- Positioning using Kalman Filtering with advanced data-snooping statistical testing techniques.
- DGPS and RGPS real-time recomputation.
- Autopilot interface controlled from instrument room leaving the navigator in charge of steering. This facility is fully integrated with a comprehensive turn planning utility providing optimum efficiency on line changes.
- Comprehensive training provided worldwide.

SPECTRA INSTALLATION

SPECTRA TRAINING

System Hardware

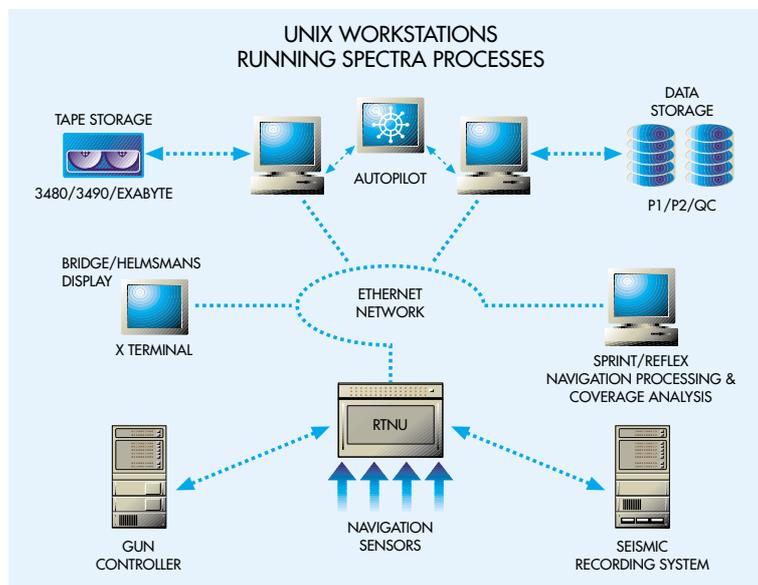

Workstations

SPECTRA supports all workstations and X-terminals running with Solaris, SunOS, AIX and HP-UX operating systems. The actual hardware configuration required is application dependent and can vary from a single low-end workstation and X-terminal for simple 2D operations to several high performance units for complex 3D surveys.

The architecture of the system provides the user with complete control over scalability.

Peripherals

The full range of SCSI peripherals supported by the UNIX operating system is available, including all major tape formats. Any postscript printer can be used for hard copy output.

Data Acquisition

The Real Time Navigation Unit (RTNU)

High capacity data acquisition and control system for 3D vessels.

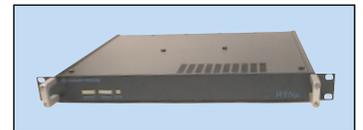

- Interfaces up to 27 independent sensors.
- Multiple seismic header output port.
- Interface code downloaded from the data server from an extensive library of over 100 navigation sensors.
- Built-in GPS receiver providing closure timing to 50 micro-seconds
- 16 programmable output triggers (TTL and Relay).
- 8 opto-isolated input triggers.

Real Time Navigation Micro Unit (RTN μ)

Compact, data acquisition and control unit for 2D, High Res, OBC and slave multi-vessel operations.

- Interfaces up to 6 independent navigation sensors.
- Single seismic header output port.
- Interface code downloaded from the data server from an extensive library of over 100 navigation sensors.
- Built-in GPS receiver providing closure timing to 50 micro-seconds
- 6 programmable input/output triggers (TTL and Relay).
- Can be stacked if expansion is required.
- Only 430mm x 400mm x 43mm.

WORLD LEADERS IN LASER MEASUREMENT TECHNOLOGY

TECHNICAL SPECIFICATION

LASER	
Type	Semiconductor Laser Diode 7.5 KHz Rep Rate
Wavelength	905nm
Beam Divergence	Vertical Horizontal
	20° 1 milli radian
Eye Safe	Class 1 CENELEC EN60825-1
Maximum Range	2,000m
Accuracy	20cm (10cm Possible Depending on Target and Scan Rate)
Angular Resolution	0.01°
MOTORISED YOKE	
Scan Speed	Up to 50° per sec
Optical Encoder	Horizontal
0° to 360°	
COMMUNICATION	
Current Loop	20mA Digital
Baud Rate	9600
POWER SUPPLY	
Output	28 V DC 3.5 amp
Universal Input	85V - 264V AC / 47 - 440Hz
	Dimensions (WxLxH)
	Weight
	160x260x140mm
	6kgs
ENVIRONMENTAL	
Operating Temperature	-10°C to +40°C
Water and Dust Resistant	IP66
PHYSICAL	
Construction	Machined Aluminium
Dimensions (WxLxH)	Standard
	With Motion Sensor
	Weight
	With Motion Sensor
	200x300x290mm
	200 x 410 x 290mm
	13.4kgs
	16kg
OPTIONAL TILT MECHANISM	
Gear Box	Servo Driven Worm and Wheel
Range	-15° to +15° (5° Increments)
OPTIONAL MOTION SENSOR	
	Heave
Accuracy	±5cm or 5% Whichever is greater
	Pitch and Roll for ±30° Vessel Motion
	Accuracy
	±0.15°
Range	±10m
Resolution	1cm
Bandwidth	0.05 to >10Hz
Update Rate	Digital -Up to 200Hz
Yaw Immunity	10° per Second with 30° Roll and Pitch
CONTROL UNIT	
	UCU
Specification	266MHz, 32Mb RAM, Windows NT4.0, Backlit Keypad, Integrated Positional Device, 800x600x250 VGA Output, Integrated Speaker
Size (WxLxH)	240x160x66mm
Weight	2.4kg
	TOUCH SCREEN OR INDUSTRIAL RACK-MOUNT PC
	Supplied to specification.

PROCESSOR &
POWER BOARD

AUTOTILT $\pm 15^\circ$
YOKE MECHANISM

GEARBOX / ENCODER

HEAVE · PITCH · ROLL · YAW
MOTION SENSOR MODULE

MDL's Fanbeam® is a laser range and bearing system designed for repetitive, high accuracy positioning and tracking of marine vessels, and static and semi-static anchored structures.

The system is primarily used to control or assist automatic dynamic positioning (DP) of a vessel next to the platform, jetty or other vessel. Fanbeam® can be employed as either a standalone collision avoidance monitoring system or as a local backup system for position control and ship/barge docking and manoeuvring. The system is also widely used to position seismic vessels gun array floats during geophysical survey operations.

THE SYSTEM

The basic system consists of a laser-scanning unit mounted on a motorised yoke that can rotate 360° at up to 50° per second. The Fanbeam® laser can measure to a range of 2,000m to within an accuracy of ± 10 cm using a vertical 20° fan of pulsed light produced by a multiple array of semiconductor laser diodes in combination with special optics.

Pulses reflected from a retro-reflector mounted on a rig or a vessels gun array, for example, is timed and multiplied by the speed of light to give distance. At the time of the received return the electro optical encoder is read to give bearing.

AUTOTILT MECHANISM OPTION

An autotilt mechanism incorporated into the yoke of the Fanbeam® allows the laser-scanning head to be adjusted by $\pm 15^\circ$ giving a total beam range of -25° to $+25^\circ$. This valuable option removes the need for the laser-scanning head to be manually adjusted during critical operations where large variations in height occur between a vessel and a rig or two vessels in different states of ballast. A rugged universal control unit (UCU) which features a backlit keypad for night operations controls the Fanbeam® with the autotilt option.

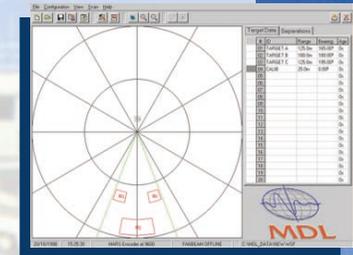

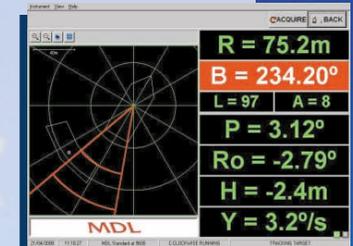

MOTION SENSOR TECHNOLOGY OPTION

MDL can now incorporate motion sensor technology into the Fanbeam® unit as an additional option. In this particular configuration, the system must be controlled via a PC that constantly updates and displays range, bearing and also heave, yaw, pitch and roll data in real-time. The errors that consistently occur between two independent systems, traditionally employed onboard a vessel, are automatically compensated for in MDL's software. This valuable option removes the need for two separate installations and complicated calibration surveys.

SOFTWARE OPTION

Fanbeam® is supplied with MDL's Single Target DP PC software as standard. In addition to a large range of configurable data output formats, MDL's Single Target DP software can be defined by the user to optimise the systems performance according to the vessels current environment. The basic software displays range and bearing information. Systems incorporating MDL's optional motion sensor technology display heave, yaw, pitch and roll as well as range and bearing information.

Alternatively, MDL can supply you with its Seismic software, which has many valuable features and procedures. The software has been designed to enable Fanbeam® to track up to twenty targets, add and modify target windows on-line and calculate the separations between any pair of targets in real-time. Improved graphics all packaged within user-friendly Windows environment makes MDL's Seismic software a valuable tool for tracking targets such as gun arrays or dyad tows.

APPLICATIONS

- Dynamic Positioning
- Collision Avoidance
- Dredging Control
- Hydrographic Survey
- Construction Barge Positioning
- Traffic Control
- Anchor Control
- Jacket Installation
- Pipe Tow Out Positioning
- Tanker Mooring
- Docking Control
- Replenishment at Sea
- FPSO Shuttle Tanker Positioning
- Mine Counter Measures
- Walk Way Monitoring

The Fanbeam® is now in regular use on board FPSO's, drill rigs and ships, survey vessels, shuttle tankers, pipe and cablelay barges, repair vessels, stone dumpers and dredgers.

ADVANTAGES

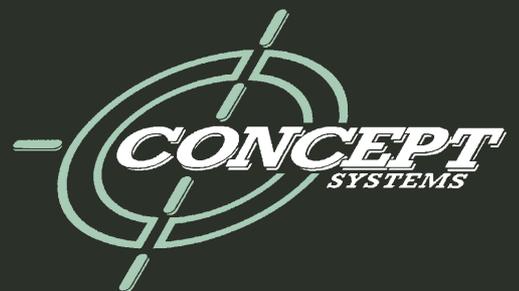

MDL's Fanbeam® system has many advantages. Our customers tell us that the Fanbeam® is straightforward to set up, performs excellently during short range operations, high accuracy is achieved consistently, the system utilises intrinsically safe targets, requires very little maintenance and is low cost compared to other systems. This versatile laser system can be employed as a primary or backup system and is considered a valuable alternative or complementary system to DGPS and other navigational aids

- Performs Excellently During Short-range Operations
- Achieves High Accuracies Consistently
- Utilises Inexpensive Intrinsically Safe Targets
- Rugged Design
- State-of-the-art Technology
- Long Product Life
- Meets Needs of a Diverse Range of Applications
- All Weather Operation
- Valuable Alternative or Complementary to DGPS
- Excellent Standalone or Backup System

Navigation Processing & QC System for Marine Geophysical Survey

SPRINT

Navigation Processing & QC System for Marine Geophysical Survey

SPRINT Navigation Processing & QC System

SPRINT has established itself as the most effective navigation data processing system in the marine seismic industry. It has been adopted by the leading seismic contractors for full production navigation processing and oil companies have chosen it as the most reliable and sophisticated QC system for offshore navigation data processing.

SPRINT provides customers with a high level of confidence in the complete navigation data set, which is available within a few hours of acquisition. SPRINT can quickly make the best use of the available data, preventing unnecessary reshoots and infill, thus reducing overall costs and ensuring the survey is completed in the minimum time.

The development of SPRINT reflects Concept's unique relationship with its market. Technical input and financial support from major oil companies were significant contributors to the initial development process. This mutually beneficial collaboration continues with feedback from the extensive list of users incorporated in Concept's ongoing SPRINT enhancement programmes.

Backed by Concept's worldwide support and training facilities, SPRINT provides customers with the means for ensuring the navigation data is both properly acquired and processed. Combined with Concept's Spectra and Reflex, they offer the ultimate integrated navigation system to meet diverse and ever changing industry needs.

SPRINT Design

SPRINT is a flexible and expandable product which has been designed around a Relational Database Management System (RDBMS) with a Structured Query Language (SQL) interface. This RDBMS environment enables users to interact in a controlled and audited manner with all data in the database. The generic database design facilitates the addition of the interfaces to contractor specific formats. In this way the system can apply state of the art processing techniques to older surveys which can result in dramatic data quality improvement.

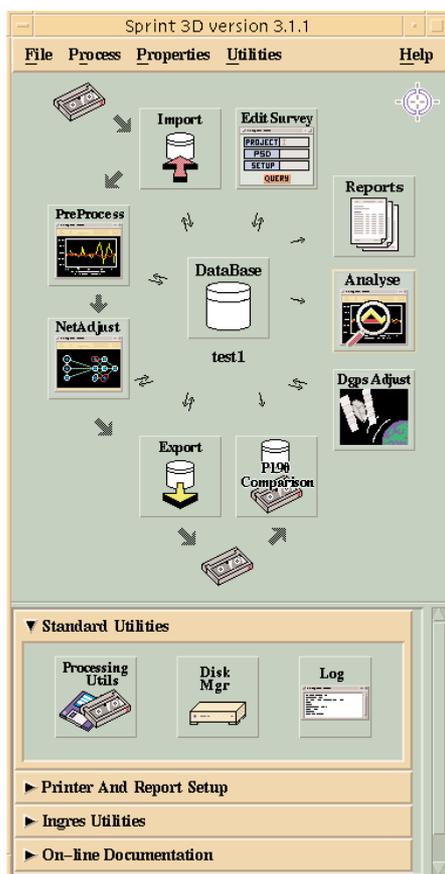

Automatic aids are used whenever possible within SPRINT to highlight potential problem areas, either data quality issues, or related to the processing of data. This ensures the problem identification and correction cycle time is minimised and results in faster throughput of data.

SPRINT's design will transparently accommodate future changes in the positioning technology so that no new software investment will be required. The latest graphical user interface (GUI) technology has been employed throughout the software ensuring that operator training is minimised.

SPRINT currently runs on a range of powerful workstations

and a variety of UNIX operating systems.

Written in industry standard programming languages it can be easily ported to a wide variety of platforms.

SPRINT MAIN MENU

Flexible Processing

SPRINT provides a choice of processing algorithms specially adapted to cater for a variety of navigation problems. These algorithms may be used in two distinct modes of operation to ensure optimum results.

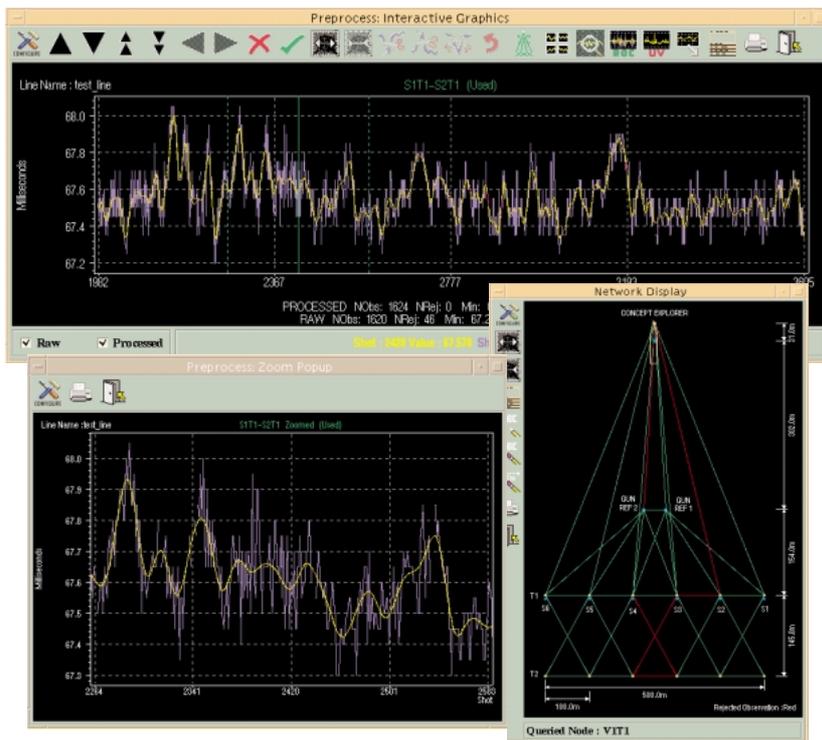

The batch processing method is used during normal operation and allows multiple lines to be processed in a way that guarantees fast turnaround. When data quality is variable, the interactive mode allows the user to perform fast 'what-if' enquiries and make quick decisions on optimum processing parameters specific

Geodetic Computations

The system uses a standard library of geodetic computation algorithms for co-ordinate transformations, datum transformations and least squares adjustment. The library was developed by Concept Systems in conjunction with a major oil company. It is designed to allow transformations using all commonly used Projection, Spheroid and Datum definitions, as well as performing the network adjustment of seismic spreads regardless of size. The system has been used successfully to perform integrated processing of four vessel, 12 streamer spreads using gyro, DGPS, acoustics, RGPS, laser and compass data.

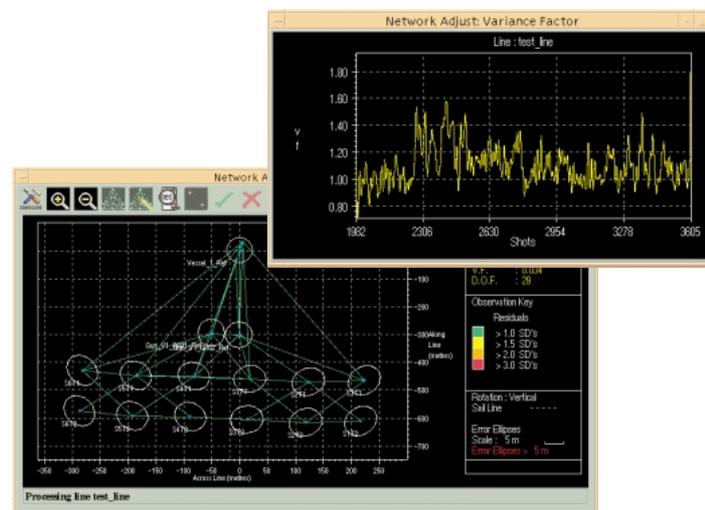

Streamer Shaping

Streamer acoustics, RGPS, laser, and compass data are integrated to give the optimum streamer node and receiver positions. SPRINT can use either a circle fit model or a polynomial fit model, which provides effective QC and allows the ideal model to be chosen for particular operating conditions.

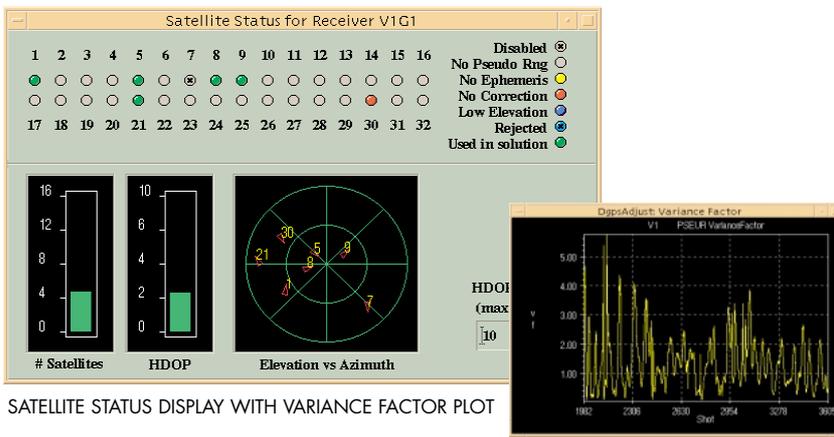

PRE PROCESS GRAPHICS WITH ZOOM AND NETWORK DISPLAY

to the requirements. Combined with powerful data editing facilities, this ensures that the acquired dataset is used whenever possible so that reshoots and infill are kept to a minimum.

NETWORK DISPLAY WITH VARIANCE FACTOR PLOT

SATELLITE STATUS DISPLAY WITH VARIANCE FACTOR PLOT

DGPS Recomputation

SPRINT can read in DGPS data (pseudo range, ephemeris, and differential corrections) from P2/94 format, validate this data format, and reprocess the data to find positions. A sophisticated stochastic model is used and statistical testing and rejection may be applied to eliminate data errors.

Both raw and computed data may be analysed using the full suite of SPRINT tools and thus the entire data set, including satellite receiver positions, may be verified and if necessary corrected in processing.

The following data may be analysed graphically:

- Raw pseudo ranges
- Elevations and azimuths
- Corrections/age of corrections
- Hdops, network unit variance

UKOOA P1/90 Verification

A SPRINT utility compares a UKOOA P1/90 file with the equivalent data stored in the SPRINT database.

This provides:

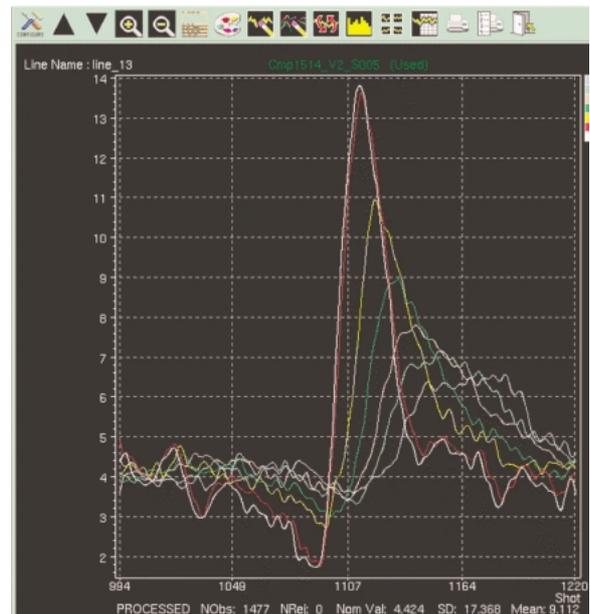

- Comparison of vessel, tailbuoy, source and receiver group records
- Presentation of results in statistical, time series, or spatial summary format
- Comparisons of water depth and cable depth
- Header verification

SPRINT can display a colour graphical plot representing all the position differences for the entire line. This allows all receivers in the spread to be analysed and displayed in a sensible fashion. The analyst thus has total confidence in the complete navigation data set.

Advanced QC

SPRINT incorporates sophisticated quality control throughout the processing cycle, from initial data input to final data output, providing full quality assurance of all archived data.

- Error checking on input data, including flagging of configuration changes.
- Automatic QC and exception reporting
- Variety of graphical analysis techniques
- Plots output to Postscript printer (full resolution)
- Reports output in spreadsheet compatible format
- Spatial attribute analysis

COMPASS DATA OVERLAY PLOT

Exporting Module

SPRINT's flexible export utility features:

- UKOOA P1/90 output, with datum transformation, trace renumbering and trace/shot range selection options
- UKOOA P2 output
- Reflex compatible ASC11 attribute file

Features

- Fast data processing from raw data (P2/86, P2/91, P2/94, Contractors format) through to UKOOA P1/90.
- Powerful interactive editing and processing functions
- Fully integrated network computation – unlimited number of points
- Flexible 2D and 3D processing options
- Batch mode (multi-line) capability in all modules
- Full Delft method statistical network analysis (NR, MDE, Xrel)
- P1/90 data provided on any commonly used Datum or Projection including RSO, Polyconic and New Zealand Map Grid
- Comparison and verification of all data in contractor's P1/90 file
- Audit trail records all processing steps
- Futureproof Open Systems implementation
- Standard Interface (SQL) to all data in SPRINT database
- Support for multi-processor architecture
- Available on multiple platforms including
 - Sun (Solaris)
 - IBM (AIX)
 - HP (HP – UX)
 - SGI (IRIX)

The SPRINT Advantage

SPRINT was developed by Concept Systems for use offshore and onshore in response to an industry demand for faster turnaround of processed navigation data in the 2D and 3D marine seismic acquisition and processing cycle.

The processing power and QC facilities of SPRINT have been used in a variety of navigation contexts. Seismic contractors have adopted SPRINT as a full production navigation processing system, while oil companies have found the system to be the most reliable and sophisticated QC facility for offshore navigation data processing.

SPRINT was designed and developed with technical and financial assistance from major oil companies BP Exploration, Mobil North Sea, Phillips Petroleum UK and Total Oil Marine as well as the UK Offshore Supplies Office. This collaboration has ensured that SPRINT meets the

industry's requirements and now the system's extensive user-base provides continuous feedback on which to base regular enhancements of the product. Recent advances include improved database technology and support for multi-processor technology, providing further significant reductions in processing time.

Benefits

- Final processing keeps pace with acquisition
- Reduces operator training costs
- Minimises reshoots and infill operations
- Guaranteed product longevity
- Provides total confidence in complete navigation data set
- Support available worldwide from Concept's navigation data processing department

1.0 INTRODUCTION

Fugro Survey Pty Ltd (Fugro) was contracted by Veritas DGC Asia Pacific Ltd (Veritas) to provide surveying services onboard the *SR/V Veritas Viking II* for the calibration of two gyro compasses, together with the verification of four Differential GPS systems and eight RGPS tailbuoy systems.

The calibrations and verifications were carried out whilst the vessel was alongside Common User Berths 11, North Quay, Fremantle Harbour, Western Australia on the 21 and 22 April 2006. All observations made by Fugro and Veritas have been recorded in UTC Time. Western Standard Time (WST) is +8.0 hours ahead of UTC Time.

This report details the procedures adopted and results obtained during the calibration and verification observations.

Details of Fugro's involvement in calibration and verification processes are presented in the Daily Operations Reports included in Appendix A.

2.0 GEODESY AND SURVEY CONTROL

2.1 Geodetic Parameters

All coordinates supplied in this report are referenced to the World Geodetic System 1984 (WGS84) except where indicated. Global Positioning System (GPS) also operates in reference to WGS84. Operations and calculations were undertaken using the following datum parameters:

Datum	:	WGS84
Reference Spheroid	:	World Geodetic System 1984
Semi-major Axis	:	6378137m
Inverse Flattening (1/f)	:	298.257223563
Grid	:	UTM Zone 50 South
Projection	:	Transverse Mercator
Latitude of Origin	:	0°
Central Meridian	:	117° E (Zone 50)
Central Scale Factor	:	0.9996
False Easting	:	500000m
False Northing	:	10000000m
Units	:	Metres

2.2 Survey Control

Two coordinated survey marks had already been established on the Fremantle Wharf by FUGRO Spatial Surveys.

The Survey Marks are shown in Table 2-1.

WGS84, CM117°E		
Name	Easting (m)	Northing (m)
13-N	381873.59	6454460.45
14-N	382035.05	6454488.72

TABLE 2-1 : SURVEY MARKS 13-N AND 14-N

Utilising these survey marks, temporary control points were established on Fremantle Wharf as shown in Table 2-2.

WGS84, CM117°E		
Name	Easting (m)	Northing (m)
FUG1	381819.32	6454450.95
TB11-B	382101.44	6454470.78
TB11-C	382105.94	6454467.49

TABLE 2-2 : TEMPORARY SURVEY MARKS

Details of the Survey Marks and field calculations are shown in Appendix B.

3.0 SURVEY PROCEDURES

3.1 Differential GPS Verification

The Differential GPS verification of the two DGPS systems, V1G1 and V1G3, on board the *SR/V Veritas Viking II* was undertaken between 08:14 and 08:43 (UTC) on 21 April 2006, as part of a post-project DGPS verification check the Differential GPS verification of the two DGPS systems, V1G1 and V1G2, on board the *SR/V Veritas Viking II* was undertaken between 00:47 and 01:16 (UTC) on 22 April 2006, for an upcoming project.

A Total Station (Topcon GTS-211D) was set up over 13-N using 14-N as the reference object (RO). Thirty observations were made to a prism attached to the centre of the antenna mast at 1 minute intervals during the observation period. These observations were synchronised with the navigation computer on board the *SR/V Veritas Viking II*. The Veritas on board navigation system was set to log WGS84 coordinates for the V1G1, V1G2 and V1G3 systems at one second intervals.

A series of bearings and distances was observed from survey station 13-N to the antenna mast. These observations were used to compute the calculated positions of V1G1, V1G2 and V1G3 antennae. WGS84 differentially corrected coordinates for the systems were extracted from the on board navigation system logs. They were matched for time with the Total Station observations, and entered as Positioning System DGPS Coordinates into Fugro's Static DGPS Verification – Single Total Station Method Sheet. Offsets from the prism to each of the antenna were taken and used for the spreadsheet.

The Static Differential GPS Verification - Single Total Station Method sheets for V1G1, V1G2 and V1G3 showing the differences between calculated and observed values are shown in Appendix C.

The general arrangement of the vessel navigation offsets on the *SR/V Veritas Viking II* is shown in Appendix D.

3.2 Gyro Compass Calibration

Gyro compass calibrations were conducted by time coordinated, simultaneous observations using two Total Stations set over stations 13N and TB11-C and referenced to stations 14-N. Observations were made prisms secured to the centre bow and stern of the *SR/V Veritas Viking II*.

The Veritas onboard navigation system was set to log raw uncorrected gyro compass headings for the Port Gyro (SG Brown) and Starboard Gyro (SG Brown) at 1 second intervals.

Two rounds of synchronized observations were taken between 07:30 (UTC) and 07:59 (UTC) on the 21 April 2006, and between 01:55 (UTC) and 02:26 (UTC) on 22 April 2006, whilst the vessel was moored alongside Fremantle Wharf. The first set of observations was taken whilst the ship was on a heading of 261°. A second set of observations was conducted with the ship on a heading of 081°. The vessel had been tied up alongside the wharf for three hours prior to the second set of observations, allowing each gyro compass to settle.

Raw values for each gyro compass were entered onto the calculation sheets as the observed true heading (O). Observations to the prisms located at the bow and stern were used to compute the calculated vessel heading (C). The calculated vessel heading (C) was compared to the observed vessel heading (O) to determine the calculated minus observed (C-O) value for each gyro compass.

The C-O determines the correction to be applied to the gyro compass raw output values. Results are provided in Section 4.0.

The Gyro Calibration Summary sheets are shown in Appendix E.

3.3 RGPS Tailbuoy Unit Verification

RGPS verification for the eight Tailbuoy units was conducted over a period during the *SR/V Veritas Viking II* visit to Fremantle.

A position was coordinated on the Fremantle Wharf close to the stern of the vessel. The tailbuoys were set as close as possible to the control mark, TB11-B, and over a 30 minute period a range and bearing of the tailbuoys was recorded from the V1G1 DGPS antenna and logged on the ships navigation system. Observations of the tailbuoys were taken at different times throughout the day.

Range and bearing of the tailbuoys from the V1G1 DGPS antenna were logged at one second intervals. These values were then reduced to produce 'observed' coordinates which were compared to the actual coordinate to give a C-O for each of the tailbuoys.

The RGPS Tailbuoy Verification Results for each of the eight tailbuoys are shown in Appendix F of the report.

4.0 RESULTS

4.1 DGPS Verification

The mean Calculated minus Observed (C-O) values for the Differential GPS verifications carried out on the 21 April 2006, are shown in Table 4-1.

System	Mean C-O (mE)	SD (m)	Mean C-O (mN)	SD (m)
V1G1	-0.276	0.890	-0.253	0.437
V1G3	0.197	0.041	-0.108	0.035

TABLE 4-1 : DIFFERENTIAL DGPS VERIFICATION 21 APRIL 2006

The mean Calculated minus Observed (C-O) values for the Differential GPS verifications carried out on the 22 April 2006, are shown in Table 4-2.

System	Mean C-O (mE)	SD (m)	Mean C-O (mN)	SD (m)
V1G1	0.100	0.280	0.084	0.043
V1G2	0.048	0.359	0.377	0.219

TABLE 4-2 : DIFFERENTIAL DGPS VERIFICATION 22 APRIL 2006

The individual observations and results for the Differential GPS verifications are tabulated in the Static Differential GPS Check Sheets located in Appendix C.

4.2 Gyro Compass Calibration

Corrections required for the gyro are shown in Table 4-3.

	Port Gyro (SG Brown)		Starboard Gyro (SG Brown)	
	Mean C-O	SD	Mean C-O	SD
Heading 081°	-0.34°	0.04°	-0.35°	0.04°
Heading 261°	-0.38°	0.05°	-0.22°	0.03°
Average heading results°	-0.36°		-0.29°	

TABLE 4-3 : GYRO COMPASS CALIBRATION

The individual observations and results of the gyro compass calibration are shown in the Gyro Compass Calibration Summary Sheets in Appendix E

4.3 DGPS Tailbuoy Unit Verification

In total eight Tailbuoys were checked, the results of which are shown in Table 4-4.

Tailbuoy	Easting (C-O)	SD	Northing (C-O)	SD
#123	0.4	1.07	-0.8	0.78
#129	-1.7	3.33	-0.9	1.72
#134	-0.8	1.04	-1.4	1.76
#135	-0.4	1.02	-1.0	1.37
#137	0.1	0.91	0.1	0.96
#143	0.1	1.03	-0.8	1.36
#144	-0.5	0.81	-0.4	0.95
#152	-0.7	1.46	-1.0	1.92

TABLE 4-4 : DGPS TAILBUOY VERIFICATION

The observations and results of each unit are shown in the DGPS Tailbuoy Verification Results sheets provided in Appendix F.

A Field Report summarising the preliminary calibration and verification results is shown in Appendix G.

AGD84: Australian National Spheroid 1966 (ANS66), a=6378160m, 1/f=298.25

Remarks

Survey Mark 13-N is located at the eastern end of the Fremantle Wharf, Berth 11. The survey mark is a steel rod set in concrete. 13-N is 34.4m north of bollard 80 on the wharf and 163.8m east of station mark 14-N. Access to the wharf is off Tydeman Rd Fremantle and a security check is required on entry to the wharf area.

At time of installation a well painted circle and the description 13-N marked the location of Survey Mark 13-N. The steel rod is significant enough that should the paint be painted a wire brush or scraper would reveal its location.

Remarks

Survey Mark 14-N is located in the centre of the Fremantle Wharf, Berth 11. The survey mark is a steel rod set in bitumen. 14-N is 34.2m north of the edge of the wharf. 14-N is also located 8.45m to the western corner of the toilet block and 16.4m to the eastern corner of the toilet block. Access to the wharf is off Tydeman Rd Fremantle and a security check is required on entry to the wharf area. At time of installation a well painted circle and the description 14-N marked the location of Survey Mark 14-N. Life of mark is expected 10 years

Static DGPS Verification - Single Total Station Method

Fugro Job Number:	P0452	Wharf:	Berth 11 North Fremantle Wharf
Job Description:	Calibration	Vessel:	Veritas Viking II
Client:	Veritas	Date:	21 April 2006
Surveyor:	M. Yorath & A. Hamilton	Antenna	V1G3
Time Zone :	UTC + 8		

Geodesy			
Spheroid	WGS84	Projection	UTM
Semi Major Axis	6378137	Central Meridian	117
Inverse Flattening	298.2572	False Easting	500000
Datum	WGS84	False Northing	10000000
		Central Scale Factor	0.9996

Station Details				Prism Offsets to DGPS System	
<i>Instrument Station:</i>	13N	Easting (m):	381873.59	Y:	-0.23
<i>Instrument Type :</i>	Topcon GTS-211D	Northing (m):	6454460.45	X:	-4.50
<i>Instrument Serial No. :</i>	136777	AHD Height (m):	0.00	Offset Convention	
<i>Backsight Station (RO) :</i>	14N	Easting (m):	382035.05		
		Northing (m):	6454488.72		
		AHD Height (m):	0.00		

Calculated Grid Bearing to RO :	080° 04' 8.78"	Correction to Gyro from Cal.
Calculated Convergence :	-000° 39' 49.66"	

Observations To:	V1G3			Easting (m):	381819.32
<i>Backsight Observation (Set to) :</i>	0°	0'	0'	<i>CHECK Backsight Station (RO) :</i>	Northing (m): 6454450.95
<i>Check Backsight:</i>	180°	0'	05		AHD Height (m): 0.00

Gyrocompass Calibration - Dual Total Station Method

Fugro Job Number:	P0452	Wharf:	Berth 11 North Fremantle Wharf
Job Description:	Stbd Gyro Calibration: 261deg	Vessel:	Veritas Viking II
Client:	Veritas	Observation Date :	21 April 2006
Surveyor:	M. Yorath & A. Hamilton	Gyro Type:	SG Brown
Time Zone :	UTC + 8	Serial No.:	Starboard

Geodesy

Spheroid	WGS84	Projection	UTM
Semi Major Axis	6378137	Central Meridian	117
Inverse Flattening	298.2572236	False Easting	500000
Datum	WGS84	False Northing	10000000
		Central Scale Factor	0.9996

Station Details

Bow	ID	Easting	Northing	AHD Height		
Instrument Station	13N	381 873.59	6 454 460.45	0.00	Instrument Type	Topcon GTS-211D
Backsight Station	14N	382 035.05	6 454 488.72	0.00	Instrument Serial No. :	136777

Stern						
Instrument Station	TB11-C	382 105.94	6 454 467.49	0.00	Instrument Type	Topcon GTS-225
Backsight Station	14N	382 035.05	6 454 488.72	0.00	Instrument Serial No. :	136340

Calculated Grid Bearing (Bow RO):	80	04	08
Calculated Grid Bearing (Stern RO) :	286	40	18
Calculated Grid Convergence :	000	39	50

Gyrocompass Calibration - Dual Total Station Method

Fugro Job Number:	P0452	Wharf:	Berth 11 North Fremantle Wharf
Job Description:	Port Gyro Calibration: 81deg H	Vessel:	Veritas Viking II
Client:	Veritas	Observation Date :	22 April 2006
Surveyor:	M. Yorath & A. Hamilton	Gyro Type:	SG Brown
Time Zone :	UTC + 8	Serial No.:	Port

Geodesy

Spheroid	WGS84	Projection	UTM
Semi Major Axis	6378137	Central Meridian	117
Inverse Flattening	298.2572236	False Easting	500000
Datum	WGS84	False Northing	10000000
		Central Scale Factor	0.9996

Station Details

Bow	ID	Easting	Northing	AHD Height		
Instrument Station	TB11-C	382 105.94	6 454 467.49	0.00	Instrument Type	Topcon GTS-225
Backsight Station	14N	382 035.05	6 454 488.72	0.00	Instrument Serial No. :	136340

Stern	ID	Easting	Northing	AHD Height		
Instrument Station	13N	381 873.59	6 454 460.45	0.00	Instrument Type	Topcon GTS-211D
Backsight Station	14N	382 035.05	6 454 488.72	0.00	Instrument Serial No. :	136777

Calculated Grid Bearing (Bow RO):	286	40	18
Calculated Grid Bearing (Stern RO) :	80	04	08
Calculated Grid Convergence :	000	39	45

Gyrocompass Calibration - Dual Total Station Method

Fugro Job Number:	P0452	Wharf:	Berth 11 North Fremantle Wharf
Job Description:	Stbd Gyro Calibration: 81deg	Vessel:	Veritas Viking II
Client:	Veritas	Observation Date :	22 April 2006
Surveyor:	M. Yorath & A. Hamilton	Gyro Type:	SG Brown
Time Zone :	UTC + 8	Serial No.:	Starboard

Geodesy

Spheroid	WGS84	Projection	UTM
Semi Major Axis	6378137	Central Meridian	117
Inverse Flattening	298.2572236	False Easting	500000
Datum	WGS84	False Northing	10000000
		Central Scale Factor	0.9996

Station Details

Bow	ID	Easting	Northing	AHD Height		
Instrument Station	TB11-C	382 105.94	6 454 467.49	0.00	Instrument Type	Topcon GTS-225
Backsight Station	14N	382 035.05	6 454 488.72	0.00	Instrument Serial No. :	136340
Stern						
Instrument Station	13N	381 873.59	6 454 460.45	0.00	Instrument Type	Topcon GTS-211D
Backsight Station	14N	382 035.05	6 454 488.72	0.00	Instrument Serial No. :	136777
Calculated Grid Bearing (Bow RO):		286	40	18		
Calculated Grid Bearing (Stern RO) :		80	04	08		
Calculated Grid Convergence :		000	39	45

Tailbuoy Verification - Direct Readings

Fugro Job Number:	P0452	Wharf:	11 North Fremantle Wharf
Job Description:	Calibration	Vessel:	Veritas Viking II
Client:	Veritas	Date:	21 April 2006
Surveyor:	M. Yorath & A. Hamilton	Time Zone :	UTC + 8

Geodesy			
Spheroid	WGS84	Projection	UTM
Semi Major Axis	6378137	Central Meridian	117
Inverse Flattening	298.25722	False Easting	500000
Datum	WGS 84	False Northing	10000000
		Central Scale Factor	0.9996

Station Details

Instrument Station:	14N	Easting (m):	382035.05
Instrument Type :	Topcon GTS-225	Northing (m):	6454488.72
Instrument Serial No. :	136340	AHD Height (m):	0.00
Backsight Station (RO) :	13N	Easting (m):	381873.59
		Northing (m):	6454460.45
		AHD Height (m):	0.00
Actual Tailbuoy Position:		Easting (m):	382101.44
		Northing (m):	6454470.78
		AHD Height (m):	0.00
Calculated Grid Bearing to RO :		263° 18' 40.01"	
Calculated Convergence :		-000° 39' 46.37"	

Observations To: Tailbuoy # 135

Tailbuoy Verification - Direct Readings

Fugro Job Number:	P0452	Wharf:	11 North Fremantle Wharf
Job Description:	Calibration	Vessel:	Veritas Viking II
Client:	Veritas	Date:	21 April 2006
Surveyor:	M. Yorath & A. Hamilton	Time Zone :	UTC + 8

Geodesy			
Spheroid	WGS84	Projection	UTM
Semi Major Axis	6378137	Central Meridian	117
Inverse Flattening	298.25722	False Easting	500000
Datum	WGS 84	False Northing	10000000
		Central Scale Factor	0.9996

Station Details

Instrument Station:	14N	Easting (m):	382035.05
Instrument Type :	Topcon GTS-225	Northing (m):	6454488.72
Instrument Serial No. :	136340	AHD Height (m):	0.00
Backsight Station (RO) :	13N	Easting (m):	381873.59
		Northing (m):	6454460.45
		AHD Height (m):	0.00
Actual Tailbuoy Position:		Easting (m):	382101.44
		Northing (m):	6454470.78
		AHD Height (m):	0.00
Calculated Grid Bearing to RO :		263° 18' 40.01"	
Calculated Convergence :		-000° 39' 46.37"	

Observations To: Tailbuoy # 152

SYNTRAK

Components

ON-BOARD EQUIPMENT

SYSTEM CONTROLLER

The System Controller is a real-time, preemptive, multi-tasking operating system that regulates the activity of the recorder and processor via a custom high-speed serial link developed by Sercel. System performance can be analyzed offline and after each boat pass, and a programmable set of quality assurance tests allows daily, weekly, and monthly system evaluation.

MSTP

An MSTP acts as an interface between two digital streamers and the recording system. Up to 8 MSTP chassis can be operated simultaneously. The MSTP controls and analyzes streamer and module diagnostics and displays them on a high-resolution monitor. Built-in QC capabilities allow daily, weekly, and monthly tests to be pre-programmed and automatically run.

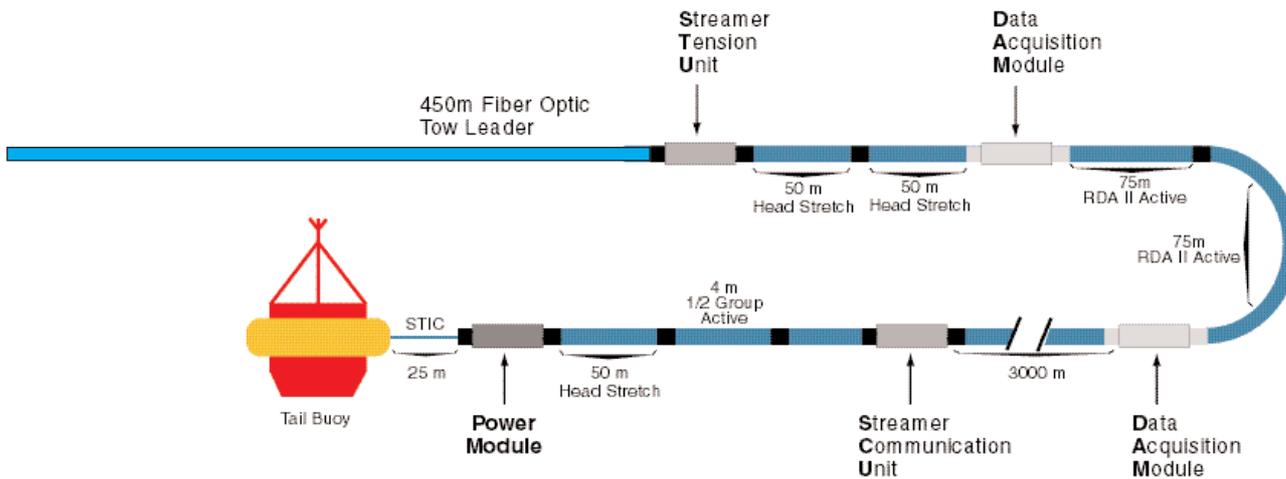

MSRS

The MSRS houses all of the hardware for collecting and recording data. The system receives MSTP data, creates headers, and formats seismic data, which it writes to tape for processing. The system allows data to be plotted in real time on two plotters simultaneously. Data may also be plotted from tape in the playback mode. Recording functions include: data collection, tape, plot, observer's log, reproduction, and off-line QC. A second MSRS allows real-time tapes copying and dual recording.

ON-LINE QC TOOLS

The SYNTRAK System is now fully compatible with SeaPro QC and SeaPro Bin software, allowing a real-time and on-line seismic QC processing and on-board binning analysis.

Components

IN-WATER EQUIPMENT

DAM

The 24-bit Data Acquisition Module offers extended resolution that allows the system to record extremely small amplitude signals. Delta-Sigma analog-to-digital conversion and DSP technology allow digital filtering and signal processing to be performed in the module.

RDA II

The Reduced Diameter Array design provides increased crush strength in the spacers and allows the streamer to survive greater physical abuse in the field, while rounded components reduce skin damage during general use. A new hydrophone virtually eliminates sensitivity hysteresis in depths down to 100 m, and a unique flow-through oil valve prevents total fluid loss if a compartment becomes damaged.

IN-WATER ANCILLARY MODULES

TAIL BUOY POWER MODULE

The Tail Buoy Power Module lies between the last active streamer section and the tail buoy and is controlled via the System Controller in the MSTs. The module supplies power to the tail buoy and can be activated or deactivated during streamer initialization and while on-line in Record Mode.

SCU

The Streamer Communication Unit boosts bird communication signal levels to enable a signal to travel to any cable length at 3-km intervals without degrading even in the presence of leakage. The SCU is compatible with DigiCourse compass/bird acoustics systems and with Sonardyne acoustic units (SIPS). A special battery backup keeps the SCU working even when power to the main streamer is interrupted.

STU

The Streamer Tension Unit manages streamer deployment, retrieval, operation, and maintenance. Powered from the streamer, the STU continuously measures the tensile load on the streamer and communicates that information shot-by-shot to an onboard recording unit. Operators use the information gathered by the STU to reduce risk during data collection, to protect in-water assets, and to optimize the time invested in the data collection process.

Specifications

IN-WATER EQUIPMENT

24-BIT DATA ACQUISITION MODULE

Number of Seis Channels	12 Channels per Module
Dynamic Range	(3 - 206 Hz : 2-ms sample rate)

Frequency	31.25 Hz Sine Wave

TEST CAPABILITY

Digitizing Module	DC Offset Equivalent Input Noise Harmonic Distortion System Dynamic Range Gain Accuracy Impulse Response Common Mode Rejection Ratio (CMRR) Internal Crosstalk Leakage
-------------------	--

EXPORTABILITY

Exportable versions of the 24-bit DAM that comply with the US Department of Commerce regulations are also available. Restricted from operating at depths less than 2 meters and at depths greater than 35 meters, these versions offer the same advantages and quality than the standard versions.

SYNTRAK TAIL BUOY POWER MODULE

Input Voltage	65 - 400 Vdc
Output Voltage	13.8, 27.6 or 48 Vdc nominal
Output Power	50 W maximum
Output Current	1A maximum
Remote On/Off Control	Via the Operator Interface in the SYNTRAK® 960-24 MSTs
Safety Feature	Internal short circuit protection to prevent instrument damage under fault condition
Sampling	Remote sampling of output voltage and current
Housing	Nitrogen - pressurized titanium

SCU™

Internal Battery Duration	1 to 4 days
Repeater Interval	4 km
Signal Delay	25 µs max.
Repeater Channels	2, FSK or DSK

STU™

Maximum In-line Tension	10,000 daN (22,000 lbf)
Accuracy	± 45 daN (100 lbf) or ± 5% of reading
Internal Battery Duration	16 hours

SHIPBOARD EQUIPMENT

SYSTEM CONTROLLER

PC Chassis	Passive backplane 48.26 cm (19") rack mount
Processor	Intel Pentium 200 MHz
CPU Memory	32 Mbytes DRAM standard
Disk Storage	1 Gbyte
Width	48.26 cm (19") standard rack mount
Height	17.78 cm (7")
Depth	55.88 cm (22") [allow 60.96 cm (24") for cable clearance]
Weight	20.41 kg (45 lbs)
Input Voltage	90 - 132 Vac or 180 - 264 Vac
Frequency	47 - 63 Hz
Graphics Display	One 1280x1024 high-resolution color graphics monitor
Printers	One Hewlett Packard LaserJet printer and one dot matrix impact printer
VME Link	DSP-controlled high-speed serial data link (55 Mbps)
Time	Synchronized to GPS receiver in MSRS Chassis
Keyboard	101 key
Mouse	Optical, mechanical or trackball
Monitor	35.56 cm (14") VGA

MSTP CHASSIS

Chassis/Bus	Custom 6U/9U VME
Input Voltage Frequency	90 - 132 Vac or 180 - 264 Vac 47 - 63 Hz
Width	48.26 cm (19")
Height	53.34 cm (21")
Depth	60.96 cm (24)
Streamer Interface	One or two Streamer Interface Boards
System Controller Interface	DSP-controlled high-speed serial data link (55 Mbps) and VME Bus Interface board
VME Controller	VME Bus Arbiter Board
QC Graphics	One QCG-II Board
GPS Receiver	One True Time GPS-VME Receiver (optional)

STREAMER INTERFACE BOARD

Maximum	960 channels at 2-ms and 4-ms sample rate
Bandwidth	1440 channels at 4-ms sample rate 480 channels at 1-ms sample rate 240 channels at 0.5-ms sample rate

MSRS CHASSIS

Chassis/Bus	Custom 6U/9U VME
Input Voltage Frequency	90 - 132 Vac or 180 - 264 Vac 47 - 63 Hz
Width	48.26 cm (19")
Height	53.34 cm (21")
Depth	60.96 cm (24)
MSTP Interface	Up to four Data Collector boards with up to four streamers each
Processing Hardware	Two System Processor boards
VME Memory	512 Mbytes to 4 Gbytes DRAM
System Controller Interface	DSP-controlled high-speed serial data link (55 Mbps) and VME Bus Interface board
VME Controller	VME Bus Arbiter
Tape Subsystem	Two SCSI-2 (fast and wide) Interface boards and a maximum of four of the following IBM compatible cartridge tape units : 3480 (dual), 3490E (single) or 3590 (single)
Disk Subsystem	SCSI Interface board, 4.0 Gbyte hard disk drive
Plot Subsystem	Up to two 55.88 cm (22-inch) or 60.96 (24-inch) plotters with a Versatec interface.

DATA COLLECTOR BOARD

Maximum Streamer Capacity	Up to 4 Data Collector Boards per MSRS chassis
---------------------------	--

SYSTEM PROCESSOR BOARD 1_RASTERIZER BOARD

Plotters Supported	2
Plotter Interface	Versatec
Rasterization Time	53 ms per trace for 8-sec record, 1-ms sample rate

SYSTEM PROCESSOR BOARD 2_RECORDING SYSTEM BOARD

Standard Format	SEG-D Revision 1, Demultiplexed, 2.5 byte (8015), 3 byte (8036), and 4 byte (8038, 8048, 8058)
Plot Types	Single-trace, Monitor
Plot Gain Modes	AGC, PGC, Fixed
Plot Low-Cut Filter	IIR Selectable ; 0, 5, 8 or 10 Hz
Trace Presentation	Wiggle, variable area

Note : Tape-blocking is supported under SEG-D Revision 1

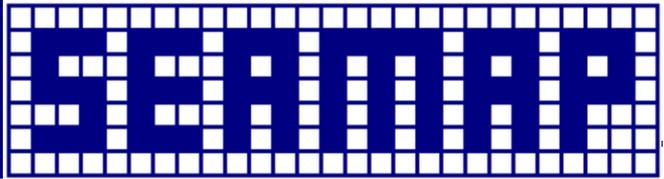

VME CHASSIS POWER

Input Voltage Frequency	90 - 132 Vac or 180 - 264 Vac 47 - 63 Hz
Height	17.78 cm (7")
Width	48.26 cm (19")
Depth	62.23 cm (24.5")

AUXILIARY INPUT UNIT

Channel Capacity	12- or 48 channel unit
Appended Modules	Append or overlay up to 48 channels of data to the end or record
Sample Rate	Same as Data Acquisition Module
Filtering	Same as Data Acquisition Module
Height	26.67 cm (10.5")
Width	48.26 cm (19")
Depth	60.96 cm (24")

BuoyLink

GPS Seismic Gun Float and Tail Buoy Tracking System

BuoyLink Module– Delrin® Housing

16 Channel P/S Interface Unit

- **Ruggedised** : Shock mounted electronics packaged in a Delrin® high strength plastic housing provides reliable operation on gun floats and tail buoys.
- **Navigation Software Interface** : Available with direct interface to Spectra™ by Concept Systems.
- **Radio**: Each 900Mhz Spread Spectrum Radio is configured with a TDMA communication protocol.
- **Radio Net Software**: User-friendly software is available for efficient management of the RF network.
- **Dual Function** : Each module is equipped with RS422 data output and optional spread spectrum radio output.
- **Accuracy** : Field Proven sub-meter accuracy.
- **Controller** : Standard 19" rack mount 16 channel on-board controller available.

Seamap's BuoyLink provides a ruggedised GPS tracking system capable of providing sub meter accurate tracking of seismic gun floats, forward navigation buoys, tail buoys, chase vessels and other remote position requirements.

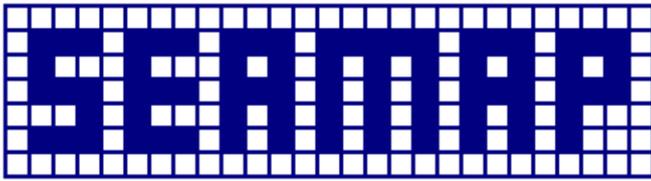

Each BuoyLink module comprises of a 12 channel GPS receiver, a power supply and data transmission system and an optional spread spectrum radio transmitter and amplifier. The electronic assemblies are shock mounted and housed in a high strength Delrin® housing with double o-ring seals. Close attention has been paid to the shock mounting design to insure reliable long term operation in the harsh environment found on gun floats and tail buoys. Each module has a standard RS422 output or optional spread spectrum

radio output. The on-board controller comprises of a 16 channel power supply capable of powering up to 16 BuoyLink modules and a 16 channel RS422 input terminals to receive the incoming data. The resultant output is send to a serial server to process a single IP string for further input to the navigation system.

A software interface is available from Concept Systems for their Spectra™ Navigation System.

The BuoyLink System provides a reliable cost effective solution for sub meter tracking of multiple seismic gun floats and tail buoys.

Description	Part Number
Standard BuoyLink Module	01-28-0308
BuoyLink with Radio Option	01-28-0309
16 Channel P/S Interface Unit	01-28-0401
BuoyLink Master GPS Interface Unit	01-28-0409
BuoyLink Spares Kit	17-28-0300
RF Management Software	16-28-0001
Radio Upgrade Kit	17-28-0301

Specifications

GPS Receiver	
No. of Channels	12
Antenna Gain	26dB +/- 3dB
BuoyLink Module	
Standard data output	RS 422 over twisted pairs
Connector	AGP 27X4M
Optional radio telemetry output	900MHz (Spread spectrum)
Frequency	902 to 928 MHz (Spread spectrum)
Output power	1w
Radio telemetry connector	AGC waterproof coaxial bulkhead
Input power	18 to 32 volts DC, typically 8 watts @ 24 volts DC
On-Board Control Unit	
Number of power channels	16 (individually switched)
Number of data channels	16 (with additional radio telemetry input)
Mounting	Standard 19" rack mounted
Mechanical	
Module housing	High Strength Delrin [®] Plastic
Module diameter (Excluding mounting clamps)	133mm
Module length (Excluding Connectors)	305mm
Module weight (Excluding clamps)	3.2kg
Mounting Accessories	
Pole Mount w/Clamp	Combination Stainless Steel and Delrin [®]
Docking Clamp	High Strength Delrin [®] Plastic
Custom Mounting Options Available	On request

SEISNET™

On-Line Data Capture & Quality Assurance

SeisNet provides the quality assurance of on-line data analysis and the security of data backup in a cost effective network of seismic data facilities:

- Data Capture
- Processing
- Plotting
- Tape Copy/Dual Write
- UNIX Network Link - e.g. ProMAX[†]

*All In Real Time
On Windows NT**

Raw/Filtered Data + RMS

Interactive real time display of raw & filtered data, trace attributes & bad trace detection.

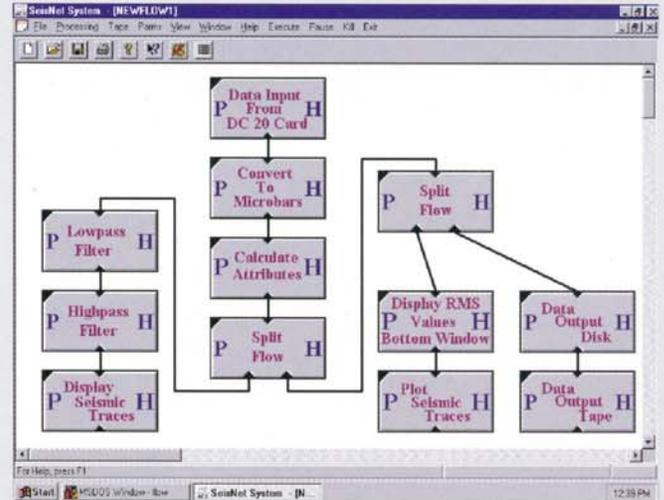

System Compatibility

SeisNet can be interfaced to most marine and land seismic recording systems.

Software Sciences, Inc.

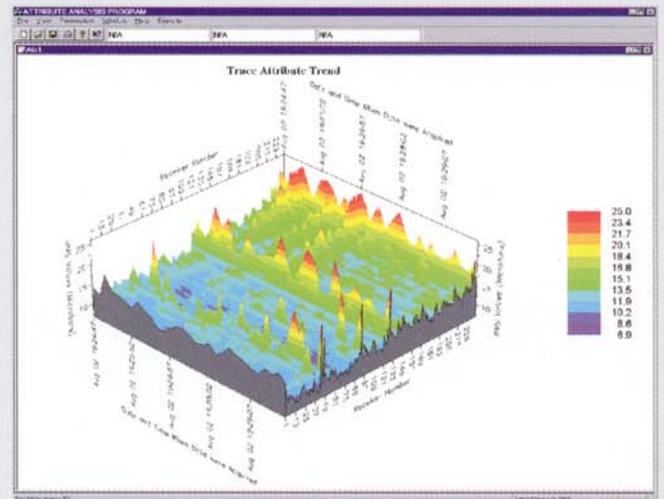

1317 West 121st Avenue
Denver, Colorado 80234, USA
Phone: 303-450-6050 Fax: 303-450-6116
Email: SSISERVER@AOL.COM

[†]ProMAX is a trademark of Landmark Graphics Corporation
* Windows NT is a trademark of Microsoft Corporation

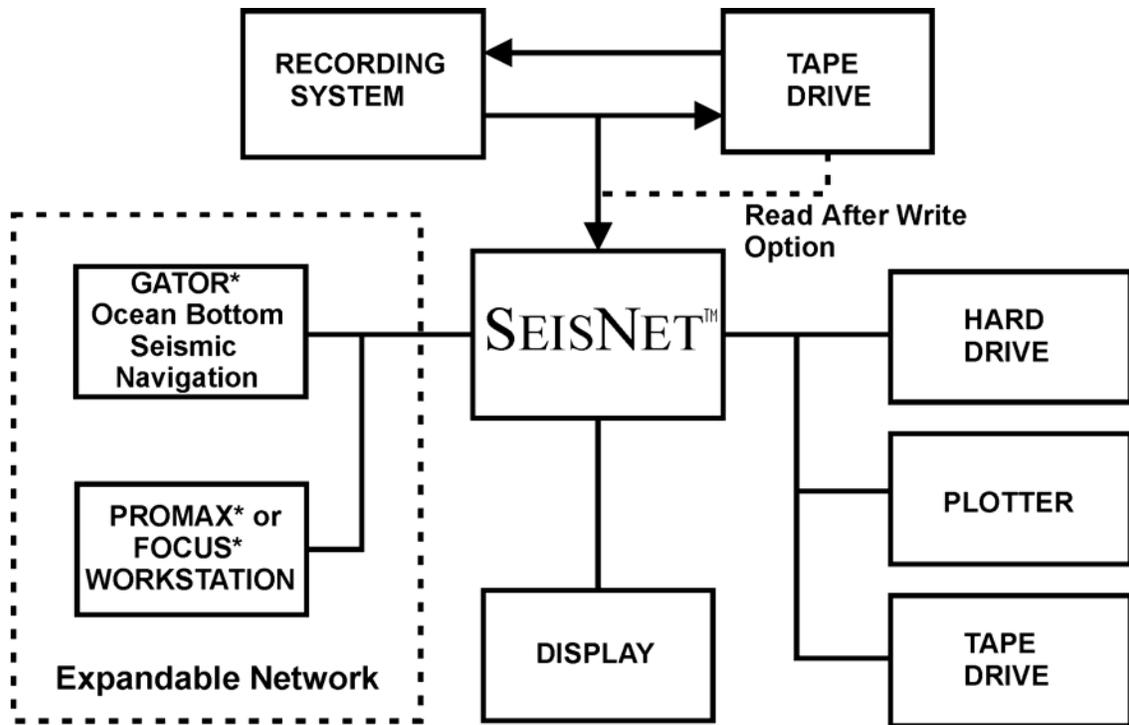

Parallel Processing

SeisNet's intuitive graphical user interface and scalable multiprocessor support allows multiple parallel processing flows to be set up and stored at the discretion of the operator. The passive recorder interface is invisible to the host recording system and allows all data operations to be performed simultaneously with the seismic data acquisition process.

Trace Attribute Trend

Trace attribute trends may be plotted over an extended time frame.

The SeisNet™ System

Capture

Fast Wide SCSI-2 (20 MBytes/Sec)

Processing

Shot Record Display + Filtering
 Amplitude & Spectrum Attributes
 Single Trace Gather
 Trace Attribute Display
 Read After Write Tape Verify
 Summing + Correlation
 Realtime Brute Stack
 Dynamic First Break Picking
 4 Component Sensor Support
 Gun Performance Database

Plotting

V80 Compatible, OYO 612/622/624
 DFM480, HP LaserJet

Tape Copy/Dual Write

3480/3490/3590, DLT, 4mm and 8mm
 Hard Disk FIFO Archive

Network Link

Focus* or ProMAX* workstation link
 OYO DAS* Recorder network link
 Gator* ocean bottom seismic link

Compatibility

Any recording system writing to a SCSI device. Fujitsu Read After Write, MDS-16/18 Y2K/Tape Drive Upgrade & Pertec interfaces also available.

Software

Windows NT 4.0 operating system
 Scaleable multi-processor executive

Hardware

Recommended host PC configuration:

Pentium III* 800 MHz
 40 GByte Hard Drive
 256 MByte RAM
 19" Monitor - 1600 x 1200 Resolution

Data Capture Hardware:

DC-20 PCI bus SCSI-2 capture card

Sound Velocity Profilers

(Click on highlighted text to open relevant file. Click “previous document” arrow, as shown, to return to this document)

The attached pdf-format files provide information on the sound velocity profilers included within the vessel spread and for stationary deployment from the workboat.

CTD-12 Plus – Water column profiler

DigiCOURSE Model 7000 – Cable hung velocimeter

The **ONLY CHOICE** for reliable measurements of Conductivity, Temperature, Depth Profiles

CTD-12 Plus Conductivity, Temperature, Depth Profiler

The CTD Plus is a lightweight, rugged, intelligent CTD designed for precision measurements of conductivity, temperature, and pressure.

The CTD Plus offers the options of logging data continuously, at user selected depth increments, at user selected time increments, or upon request.

The output format can be configured for "real" computed engineering values or "raw" integers for post processing.

A standard feature of every CTD Plus is AML's powerful, user friendly MS Windows™ compatible "Integrated Systems Software." ISS allows for viewing, editing, printing, and graphing of data logged by the instrument.

Features

- High accuracy and resolution
- Internal calculation of salinity according to UNESCO standards
- Non-volatile memory to 200 Mbytes
- Windows™ compatible software
- Autonomous battery powered instrument
- Small size, light weight for easy handling
- Profiling to 5000 meters or in-situ long term deployments
- Supports four additional sensors
- Optically isolated autobauding RS-232 communications to 19.2 Kbaud
- Real time clock
- Five year limited warranty

Instrumentation
THROUGH
Innovation

**APPLIED
MICROSYSTEMS
LTD**

CTD-12 Plus

Conductivity, Temperature, Depth Profiler

Electrical

- Non-volatile 128K RAM expandable to 200 Mbytes
- 4 1/2 digit analog to digital converter (40,000 counts resolution)
- 11 scans per second for date/time, C, T, D and battery
- Real time clock
- Optically isolated autobauding RS-232 port
- Supports four additional analog channels
- Auto shut-down in low battery conditions

Power

- Alkaline (9 x "D" cell) 10 A-H
- 80 mA sampling
- 5 mA standby
- 0.04 mA sleep mode

Battery Options

- Lithium (3 x "D" cell) 14 A-H
- Nicad (9 x "D" cell) 4.4 A-H
- External power (8 to 16 volts DC)

Software

- Real time graphing & tables
- Instrument setup
- Downloading data
- Exporting data
- Windows™ 95/98/NT compatible

Mechanical

- Weight: 9.0 kg (19.7 lbs) in air
3.5 kg (7.6 lbs) in water
- Dimensions: 675 mm (26.5") x 102 mm (4.0") Ø
- Construction: Hard anodized 6061-T6 aluminum; rated to 5000 meters
Optional: 7075-T6; rated to 8000 meters
- Connectors: IMPULSE Wet Pluggable™ series
- Environmental: Operating: -20° to 50°C
Storage: -40° to 70°C

Sensors

- Conductivity: Patented platinized four electrode glass cell
- Temperature: Pressure protected, aged thermistor
- Pressure: Semiconductor strain gauge (optional temperature compensation)

Accessories

- Protection cage
- Radio modem
- Suspension bar
- Additional cable

SENSOR SPECIFICATIONS		Range	Response	Accuracy	Resolution

Model 7000 Streamer Mounted Velocimeter

- Real-time, 0.5-meters/second (RMS), sound-propagation velocity accuracy
- Sound velocity measurements typically once every 60 seconds (operator-selectable)
- Bi-directional communications
- Industry-standard batteries
- Sound velocity measurements transparent to the seismic-acquisitioning process
- Easy installation
- Common shipboard hardware and software

The Input/Output Model 7000 Velocimeter is a microprocessor-based, speed-of-sound measurement device that is mounted externally onto a seismic streamer cable. The assembly is streamlined to minimize noise and is designed for compatibility with existing mounting hardware and communication coils. The device is temperature-compensated.

The sensor directly measures the time of flight of a single acoustic pulse over a fixed-length baseline. Real-time, sound velocity observations are made within the same water column that the acoustic streamer cable-positioning measurements are made. The Model 7000 will allow for real-time and post-processing corrections for the observed velocity variations, providing an increase in acoustic-ranging accuracy to improve the positioning network solution of the seismic receiver arrays.

Specifications

INPUT/OUTPUT, INC.

Housing	uni-body platform, DigiCOURSE® 5000
Weight (in air)	6.0 kg (13.2 lb)
Weight (in sea water)	1.3 kg (2.9 lb)
Length	1.47 m (58 in)
Mounting	Industry-standard collars on 0.57-m (22.5-in) centers
Shock	1-m drop test onto hard surface
Operating Temperature	-4°C to +40°C (+25°F to +104°F)
Maximum Operating Depth	122 m (400 ft)
Survival Depth	244 m (800 ft)
Power	4, D-cell, lithium batteries <i>standard</i> SLB 150 battery pack <i>optional</i>
Battery Life	100 days _{typ} @ 60-s sample rate (<i>standard</i> D-cell batteries) 250 days _{typ} @ 60-s sample rate (<i>optional</i> SLB 150 battery pack)
Resolution	0.1 m/s
Accuracy (RMS)	0.5 m/s
Measurement Range	1400.0 m/s to 1550.0 m/s
Sample Rate	User-selectable; default is every 6th-shot interval
Communications	2400-bps, serial, FSK
Data Output	Binary data message; poll upon demand to host-CPU
Limited Warranty Periods	1 year; 2 years for velocimeter calibration
System Data Display	Status for and speed of sound for each active device; updated each scan cycle

MK21 OCEANOGRAPHIC DATA ACQUISITION SYSTEM

Sippican's MK21 Oceanographic Data Acquisition System provides oceanographers, marine scientists and ocean engineers with a versatile and low cost capability to collect, display and store data from expendable oceanographic instruments.

MK21 SYSTEM DESCRIPTION

The MK21 Oceanographic Data Acquisition System is a 5/8 size PC card which is installed in an IBM compatible Pentium computer with an ISA slot. The MK21 uses DSP technology for onboard processing and buffered I/O for operation with Windows 95 and higher. Data collection is controlled by the MK21 and the buffered I/O stores all the data until it can be read in by the operating system. Every data point is time stamped by an independent clock on the MK21 to ensure no data is lost or skipped. The MK21 also has flash memory for in system programming capability to give users the flexibility to add newly developed probe capability and firmware upgrades. The MK21 is compatible with all Sippican expendable probes and launchers.

The MK21 may be used anywhere a PC is available aboard research vessels, on ships of opportunity or even in small boats. The MK21

may also be used in aircraft with Sippican air-launched expendable probes.

Software developed for use with Sippican products provides a variety of data processing capabilities. Profiles of ocean characteristics may be displayed real-time in graphic form and the data permanently stored. The user may retrieve this information for further analysis in several formats to aid in a detailed understanding of the ocean environment.

MK21 OPERATION

The operator uses the computer keyboard and display to input the type of probe to be launched and other parameters to be stored with the data such as date, time and latitude/longitude in a preformatted header display. The computer performs system diagnostics and prelaunch tests and then indicates the probe is ready for launch. It then receives probe data during the probe descent and displays and stores the information.

Data is easily translated in an ASCII text format so the user can readily generate the measured profiles using spread sheet applications or transfer the data to ray path or range prediction programs.

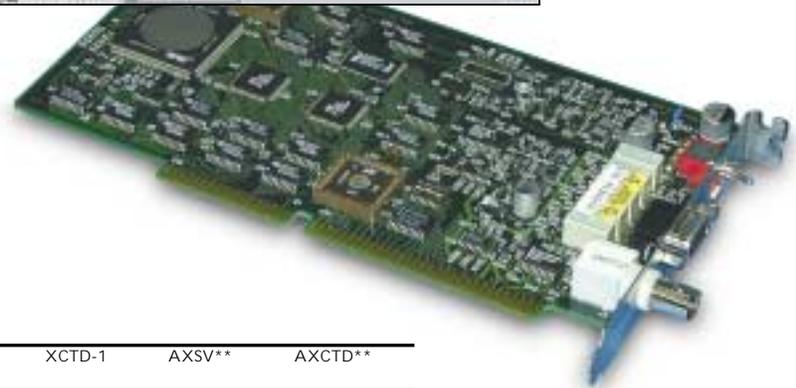

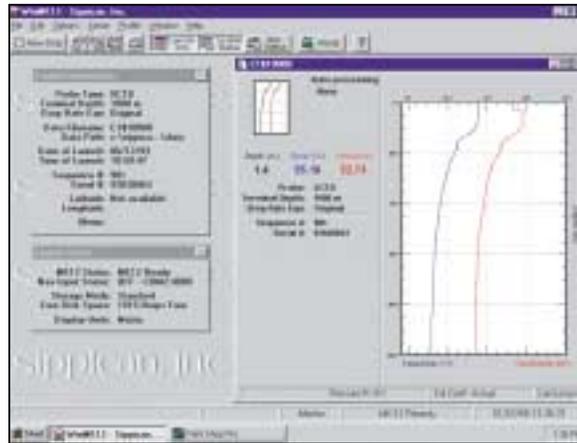

The MK21 Windows Software has auto GPS (NMEA 0813) input capability, selectable IGOSS and original drop rates, a new, easier-to-use display and improved post-processing options. The XCTD trace shown in the accompanying screen shot demonstrates some of the software's features:

- A highly visual, user-friendly display that utilizes the capabilities of Windows
- Improved post-processing options

- User-selectable features include drop rate, probe min / max depth, auto post-processing, noise reduction, data averaging, and calculated salinity, density, and sound velocity profiles.

THE MK21 KIT CONTENTS

The MK21 processor card, Sippican MK21 application software, MK21 to launcher interface box, and Operator's manual.

MK21 SYSTEM SPECIFICATIONS

PROBE TYPE	XBT	XSV	XCTD	XCTD-1	AXSV**	AXCTD**
Sampling Rate	10Hz	10Hz	4Hz	4Hz	10Hz	4Hz
Vertical Resolution	60cm (18cm for T-11 FSXBT)	60cm	100cm	17cm	60cm	100cm

Marine Acquisition

Action Point Register Report SR/V Veritas Viking

Active

Action Point Status: Active
Date Opened: 06/12/2006
Est. Date Closed: 06/29/2006
Party Responsible: Tech/APM
Non-Conformity: Intercom system from back deck is very hard to make out in recording room
Action to be taken: New amplifier?

AP Reference No: 339
Origin: APR
Act. Date Closed:

Date: 06/12/2006
Author: Committee Meeting

Comments:
Comments: Veritas technician investigating.

Date: 07/24/2006
Author: Committee Meeting

Comments:
Comments: Tech to continue to look into the problem but do not see an immediate solution. The outside areas are very large and the ambient noise would be hard to dampen

Closed

Action Point Status: Closed
Date Opened: 06/18/2006
Est. Date Closed: 06/19/2006
Party Responsible: Chief Engineer
Non-Conformity: Engine starting problems and loose fanbelt noise coming from engine compartment on bucket use.
Action to be taken: Ships Engineer and Electrician to investigate and repair.

AP Reference No: 341
Origin: V2-IR-06-CVVG6QV6MK
Act. Date Closed: 06/18/2006

Action Point Status: Closed
Date Opened: 06/12/2006
Est. Date Closed: 09/29/2006
Party Responsible: Eidsvik
Non-Conformity: The internal door to the hospital is not wide enough to traverse a patient on a stretcher.
Action to be taken: A request has been made to widen the door during the pending vessel dry dock, scheduled for September 2006. Eidesvik to investigate.

AP Reference No: 340
Origin: V2-IR-06-VVIG6QQ79J
Act. Date Closed: 07/24/2006

Date: 07/24/2006
Author: Committee Meeting

Comments:
Act Date Closed Changed: From Null To 25/07/2006
Status Changed: From Active To Closed

Comments: It is felt that due to the tight confines of the hallway that the internal door would not be of practical use when transporting a patient into the hospital via a stretcher. The external door is large enough to accommodate the width of a stretcher, as to vessel design.

Action Point Status: Closed **AP Reference No:** 338
Date Opened: 06/12/2006 **Origin:** APR
Est. Date Closed: 06/29/2006 **Act. Date Closed:** 07/06/2006
Party Responsible: Ch. Mechanic
Non-Conformity: Extinguisher 21 outside rigging store has bracket bent and hose is not secure
Action to be taken: New bracket to be fabricated

Date: 06/12/2006 **Author:** Committee Meeting
Comments: Comments: In hand. Onboard mechanics will fabricate required bracket and re-secure fire extinguisher 21. This will be done at the earliest convenience.

Date: 06/26/2006 **Author:** Greg Campbell
Comments: Extinguisher 21 outside rigging store has had a new bracket installed and the hose has been made secure with an additional hook.

Date: 07/24/2006 **Author:** Committee Meeting
Comments: Act Date Closed Changed: From Null To 07/07/2006
Status Changed: From Active To Closed

Comments: New bracket installed

Action Point Status: Closed **AP Reference No:** 337
Date Opened: 03/30/2006 **Origin:** AU-OV-0580
Est. Date Closed: 04/16/2006 **Act. Date Closed:** 05/24/2006
Party Responsible: Electrician
Non-Conformity: Stern spotlights for reels 5 and 8 not working.
Action to be taken: Spotlight globes need changing by electrician

Date: 04/12/2006 **Author:** Committee Meeting
Comments: Comments: Need to have a stable platform to work from. To be taken care of at next port call or at the up coming shipyard.

Date: 05/24/2006 **Author:** Committee Meeting
Comments: Act Date Closed Changed: From Null To 25/05/2006
Status Changed: From Active To Closed

Comments: Spotlight globes were replaced by the vessel's electrician in Fremantle, Apr 2006.

Action Point Status: Closed **AP Reference No:** 334
Date Opened: 03/17/2006 **Origin:** V2-IR-06-OSVV6L7ASE
Est. Date Closed: 04/29/2006 **Act. Date Closed:** 06/12/2006
Party Responsible: Ch Off; Captain
Non-Conformity: Straps for securing hoses in some fire-hose cabinets are either missing or perished.
Action to be taken: New straps have been ordered by the bridge and once they are received and fitted, this AP will be closed.

Date: 03/17/2006 **Author:** Committee Meeting
Comments: Comments: These items have been requisitioned by Eidesvik. Awaiting a requisition number from the chief officer to allow this to be tracked.

Date: 03/22/2006 **Author:** PM Veritas-Viking2
Comments: Eidesvik requisition number 68-0019-2006. When the items are received onboard and fitted, this AP will be considered closed.

Date: 04/12/2006 **Author:** Committee Meeting

Comments: Comments: Should arrive onboard during next port call in Fremantle

Date: 05/24/2006 **Author:** Committee Meeting

Comments: Comments: No change in status. Eidesvik requisition number 68-0019-2006. Waiting for straps to arrive. When the items are received onboard and fitted, this AP and attached IR will be considered closed.

Date: 06/12/2006 **Author:** Committee Meeting

Comments: Act Date Closed Changed: From Null To 13/06/2006
Status Changed: From Active To Closed

Comments: Fire hose storage box straps have been replaced/ repaired. AP considered closed.

Minutes:

Drill Details:

1245 – Alarms sounded and all crew mustered

1248 – All hands present.

1248 –1302 All new joining crew were briefed about Life boat boarding and launching procedures. Uses of Lifeboat equipments were also explained. Life boat engines checked and tried out and found satisfactory

1302 – 1307 Immersion Suits donning carried out by new joining crew.

1307 – 1315 Life Raft Launching and boarding procedures,

1315 Drill completed

1315 – 1345 Lifeboat lowered to embarkation deck and housed back.

Analysis

A good response and familiarisation session.

Comments

All equipment worked well.

Drill Details: Simulated Fire in Laundry

1245: Fire detection pre-alarm on bridge activated and Announced Fire in Laundry Crew to Emergency/Muster stations.

1248 Command team informs isolation of electrical power and vents to laundry room

1251 All heads present at muster station except first aid team reports 2nd cook missing

1251 Tech team confirms that electrical and ventilations to laundry room isolated

1253 Fire team 1 prepares to enter laundry room, Fire team 3 commences boundary cooling, Fire team 2 stand by as back up. Muster station control conducts search operation for the missing person.

1255 Fire team 1 reports casualty located in laundry room and evacuates

1256 Casualty brought out of the laundry room and hand over to first aid team

1257 Fire team 1 continue fighting the fire

1259 Fire team 1 reports fire extinguished and checks for any reignition, and fire team 3 and Engine room team confirms no sign of heat on bulkheads and deck heads and fire chief reports fire extinguished.

1300: Drill complete. Personnel dismissed.

1305 – 1315 Debriefing carried out on bridge

ANALYSIS

A good response by all involved and excellent coordination.

COMMENTS

Important to return to some of the basics of Emergency response. Aim is to deal with small situations to prevent them from developing into significant problems.

Minutes:

Drill Details:

1245 – Alarms sounded and all crew mustered

1250 – All hands present.

All new joining crew were briefed about Immersion Suits donning procedures,

Life Raft Launching and boarding procedures, Life boat boarding and launching procedures.

Uses of all Lifeboat equipments were also explained.

1317 – Drill completed

Analysis

A good response and familiarisation session.

Comments

All equipment worked well.

Audit Detail / Attachments:

Gentlemen,

Please find attached the 2nd draft SHE recommendation for the VVII amended after the wash-up meeting on board. The chronometer cal rec is removed. Two duplicates are also removed.

Added are recommendation resulting from Dr Jonathan Mushin's MOH review. These recs are included for convenience only. They will be documented in the MOH review/inspection issued by Jonathan in due course.

A complete draft report will be submitted to ExxonMobil for review and distribution after the inspection of the OMS Voyager.

Jackie / Mike - please would you distribute to other relevent Veritas and Eidesvik personnel for whom I don't have e-mail addresses.

Regards,

Dave Waters

Action: <i>Chairperson</i> 5. For the next round of awards starting in September, we will need to check with everyone what sort of things would be preferred, either single awards or a group award. Action: <i>Committee Members</i> 6. The winner for the best AIM observation was decided by the committee, given to Larry Tan for his observation in the cable store, which was closely followed by the observation by Galen Hieb on drum-slinging operation. Larry gets 5 extra safety points for his efforts. Action: <i>Rewards Administrator</i> <p>Finally...</p> <p>All crew members are encouraged to continue making observations, and remember that the observations are there to help both the observer and observee become more aware of and improve their own safety practices and performance . All crew are encouraged to take a couple of cards with them whenever they go out to do some work.</p>

General Meeting Minutes :

1300 hrs: Meeting opened by Howie Grizaard.

Reviewed and discussed minutes from previous meeting, dated 25 May '06.

Reviewed and discussed open incident reports - 4 IRs closed and all remaining open IRs updated with current status.

Reviewed and discussed open action points - comments and status on above attached AP register.

1330 hrs: The floor was opened for new business.

Les Hayden (Chief Observer):

General reminder. The guard railings around the streamer winch motor housings have been removed for easier access. The railings have now been replaced with Dextron rope. These motors are subject to planned maintenance and until now have proved difficult to get to.

Fedelino Manalang (SOS Medic):

The internal door to the hospital is not wide enough to traverse a patient on a stretcher. A further request to widen the door was made. An IR and AP will be generated to ensure correct follow-up. Eidesvik are investigating.

Steve Dyer (Chief Mechanic):

The stbd aft streamer deck stairway railing leading to the gun deck has been repaired and is no longer bent.

Gerhard Honiss (Australian Chief Officer):

General reminder. The fire protection suits onboard are only Fire Proximity Suits and not full entry suits.

1340 hrs: Meeting closed.

General Meeting Minutes :
<p>AIM Committee Meeting</p> <p>A meeting was conducted to discuss the current AIM topics.</p> <p>Points raised during the meeting were as follows :-</p> <ol style="list-style-type: none"> 1. Everyone who has had difficulty entering in their own AIM observations has been given instruction , and further instruction will be made available by committee members as necessary . 2. The Special Projects Manager has made a folder for presentations and will give instruction to new people to the vessel from now on. Three people are currently awaiting induction. 3. A requisition for the last AIM rewards to be followed up with instruction that AIM rewards should be made for the attention of the AIM Committee. Action: <i>Chairperson</i> 4. A poster showing who are the committee members will be placed on the AIM notice-board, and a reminder on how many points are accrued by people will be displayed by the end of this weekend, along with everyone's AIM totals. Action: <i>Chairperson</i> 5. Mark Cassellis will be contacted to see if he can fix the listing function that allows people to see what observations they have put in. Action: <i>Chairperson</i> 6. All committee members will help AIM advance further by encouraging everyone to walk around with AIM cards in their pockets. This will be promoted as the same as any piece of safety equipment, so that people have them whenever they go do an activity that might warrant an observation. A new sign will be placed on the exits to the back-deck reminding people to take a card with them. Action: <i>Committee Members</i> <p>Finally...</p> <p>All crew members are encouraged to continue making observations, and remember that the observations are there to help both the observer and observee become more aware of and improve their own safety practices and performance.</p>

General Meeting Minutes:

AIM Committee Meeting

A meeting was conducted to discuss the current AIM topics.

Points raised during the meeting were as follows :-

1. The idea of getting everyone to enter in their own AIM observations into the system was discussed, and it was agreed that this is working fine. An email will be sent out with a few extra instructions to help people use the entry system. **Action:** *Chairperson*
2. The task of the Special Projects Manager (SPM) was further discussed, encompassing the main role of inducting new people onboard into the AIM system. The SPM will firstly fully familiarize themselves with the AIM entry system, and also become familiar with the AIM induction presentations. **Action:** *SPM*
3. The last incentive scheme rewards requisition will be checked into. **Action:** *Chairperson*
4. A poster showing who are the committee members will be placed on the AIM notice-board, and a reminder on how many points are accrued by people will be displayed, along with everyone's AIM totals. **Action:** *Chairperson*
5. It was decided by the committee that once per month, the committee will go through the incident reports to ascertain what are the behavior-causes to any of them, using this information to create some statistics that could point to areas that need special safety awareness, care and attention by those on board. The IRs will be collected by the IR Coordinator (aka *The Enforcer*). **Action:** *IR Coordinator/Committee Members*

Finally...

All crew members are encouraged to continue making observations, and remember that the observations are there to help both the observer and observee become more aware of and improve their own safety practices and performance.

General Meeting Minutes :

1300 hrs: Meeting opened by Howie Grizaard.

Reviewed and discussed minutes from previous meeting, dated 13 Apr '06.

Reviewed and discussed open incident reports - 8 IRs closed and all remaining open IRs updated with current status.

Reviewed and discussed open action points - comments and status on above attached AP register.

1327 hrs: The floor was opened for new business.

Steve Dyer (Chief Mechanic):

General reminder. Remote unit valves for the stbd crane knuckle have been ordered. The knuckle currently only works with the manual auxiliary controls.

Les Hayden (Chief Observer):

General reminder. The guard railings around the streamer winch motor housings have been removed for easier access. The railings will be replaced with chain. These motors are subject to planned maintenance and until now have proved difficult to get to.

Fedelino Manalang (SOS Medic):

The internal door to the hospital is not wide enough to traverse a patient on a stretcher. A request to widen the door was made. This will be further investigated. An IR will be generated to ensure correct follow-up.

Dave Danyluk (Client Representative):

The stbd aft streamer deck stairway railing leading to the gun deck is bent. The onboard mechanics will further investigate and make repairs as necessary.

Roger Weeks (Australian Master):

General reminder. Crew were asked to show common courtesy when traversing the accommodation areas of the vessel. Keep noise to a minimum, do this by; keeping voices down and closing cabin doors gently. Numerous complaints made of slamming doors. The Australian Master will generate an IR to raise crew awareness.

1337 hrs: Meeting closed.

General Meeting Minutes:

Meeting Opened at 12:30 in Ships Library

Meeting opened with the reading of the previous minutes:

Items arising out of minutes.

- It was agreed that a trial of having people entering their own observations would be a good idea. The proposed start would be ASAP and a meeting would be held in the instrument room on the 24th May to inform the crew of the changes.
- Although people would be entering their own observations into Lotus Notes, the AIM card will still need to be used and submitted to the scribe as normal. This will be able to be changed if it proves impractical but for a start it was thought that it would allow the scribe to assess observations better this way.
- Monthly prize was also agreed to be a good thing. Melissa Li was selected as the outstanding observation for May for her Observation of deployment of a head-float.
- A Special Projects Person was discussed: Lenny Tankard was approach agreed to take on the position of his rotation duties to comprise of initial induction of new hires into AIM.

The reintroduction of causal charts for incident reports was discussed and agreed to, this would comprise analytical charts of immediate causes of all IR's submitted in since the last Committee meeting. It is hoped that by analysis of immediate causes of incidents, steps can be made to improve awareness in these areas.

Jeremy Collins was welcomed to the committee, Jeremy takes over Scribe duties from Paul Wilks. As this is Jeremy's second time on the AIM Committee, the traditional welcome afforded to Richard Francisco was not necessary.

The meeting closed at 12:55

Minutes:

Drill Details: Fire in Engine room

1245: Fire alarm on bridge activated, P.A. Announcement made.
1248: All Crew mustered and accounted for.
1248. All engine room vents closed, all engine room staff ordered to evacuate
1249. Chief engineer standby near co2 cabinet
1249. Hot spots checks being carried out and boundary cooling in progress
1253. Head count taken and confirmed no crew in the engine room
1254. Master instructs to deploy co2
1255. End of drill and crew stand down

ANALYSIS

Drill conducted in recognised high-risk zone

COMMENTS

Ship mustered quickly and initial response to fire very quick.
Good response to the need to shift muster station.

Minutes:

Drill Details: Fire Muster and Briefing

1245: Fire alarm on bridge activated, P.A. Announcement made.

1254: Fire Teams all reported in

1256: All Crew mustered and accounted for.

1257: All crew relocate to focsle for safety briefing

1305: Exercise complete, all crew returned to normal duties.

ANALYSIS

To prove Emergency Station response times.

To familiarise crew with safety equipment and procedures onboard and instil confidence.

COMMENTS

Muster times slightly below target but overall good response with clear communication and no confusion.

Crew briefed on different types and uses of portable fire extinguishers and escape procedures from smoke and heat filled compartments

JSA/Procedure Review
Veritas Viking2
07/10/2006

20323 --- Greater Bream 3D 2006

I. JSA Information

1. JSA Title: Entering Streamer Reel Drum	2. JSA Location: Streamer deck
3. JSA No:	4. JSA Page No: Page 1 of 1
5. Date JSA Conducted: 07/10/2006	6. New Revision ?: Revised
7. Does a SOP already exist for this activity ? No	8. If Yes, then SOP Name / Number:
9. Title of Person who routinely does (or will do) the activity the JSA is being conducted for: Observers Dept/Technician	10. Department of Person in Step 9: Observers
11. JSA Conducted by: Neil Collinge	12. Supervisor: Jackie DeLaughter

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
1	Toolbox meeting			Clarify each person's task & identify what can be done to minimize the risks.
2	Obtain a 'confined space' work permit from Bridge.			
3	Prepare tools & provide adequate lighting.	Tools slipping.. Poor visibility.	Grazes/ cuts/ bumps. Being hit by moving or falling objects.	Personnel to don appropriate PPE. Ensure tools are in good condition. Use torch or portable lighting.
4	Disable energy supply to reel..	Accidental reel operation or incorrect reel being disabled leading to reel moving with person inside.	Serious injury.	Turn off the reel's hydraulic supply valve. Fit the 'lockout/tag out'. Use electrical cut out switches. Check reel cannot be moved manually or remotely before entering.
5	Turn streamer power off for reel.	Electric shock.	Burn. Electrocutation	Ensure power is off by checking the voltage meter on the front of cable power supply. Also move the power supply toggle switch to the disable position and tag it out.
6	Unbolt slip ring from reel drum	Cramped /awkward working conditions close to pipes.	Pulled muscles/ strains/ abrasions/ bumps	Position toolbox close to the reel being entered. Obtain assistance. Use the appropriate tool for the task.
7	Remove slip ring from reel drum	Overreaching, manual handling. Cramped working conditions	Muscular strains. Jammed fingers. Abrasions.	Obtain assistance for handling of the Slip ring.
8	Climb into reel drum	Awkward entry position. Slippery surfaces. Hot hydraulic pipes.	Body stressing. Slips. Falls. Abrasions. Bruising. Burns.	Stepback. Inspect entrance. Clean pipe work. Remove grease. Check proposed entry handholds.
	Carry out armour connection work.	High temperatures. Minimal ventilation. Confined space. Claustrophobia.	Heatstroke. Exhaustion. Claustrophobia. Panic.	Move & work slowly. Have a person assist you if necessary. Have water & portable fan available nearby. Have a person on stand-by outside reel.
	Exit reel drum.	Awkward exit position. Slippery surfaces. Hot hydraulic pipes.	Body stressing. Slips. Falls. Abrasions. Bruising. Burns.	Stepback. Inspect exit. Pass all tools & equipment out first. Check handholds you will use to exit. Obtain assistance.

III. JSA Acceptance of Risk Tolerability

A. Risk Score Prior to Mitigation: Moderate	B. Risk Score Post Mitigation: Low
C. Risk Tolerable: Yes	D. If No, describe actions:
E. JSA Accepted / Approved by: Cass Cassim	F. Job Title: Operations Supervisor
G. Date Accepted / Approved: 01/18/2006	

H. Comments:

Marine Acquisition
JSA/Procedure Review
Veritas Viking2
06/12/2006

20323 --- Greater Bream 3D 2006

I. JSA Information

1. JSA Title: Workboat section change out	2. JSA Location: Bass Straight, Australia
3. JSA No:	4. JSA Page No: Page 1 of 1
5. Date JSA Conducted: 06/12/2006	6. New Revision ?: Revised
7. Does a SOP already exist for this activity ? Yes	8. If Yes, then SOP Name / Number: No
9. Title of Person who routinely does (or will do) the activity the JSA is being conducted for: Seismic personnel	10. Department of Person in Step 9: Observers
11. JSA Conducted by: Observers	12. Supervisor: OS

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
1	When streamer is surfaced the mother vessel will reduce the water speed to approx. 3.0 - 4.0 knots and the workboat will locate the faulty section.	Running over streamer if not positioned properly or lost sight. Propellor cage catching on CMU's	Damage section/CMU's d/t dragging workboat. Workboat out of coxswains control.	Visual sighting confirmed of streamer. Coxswain to be informed of streamer position. Streamer can be brought to 3.0 mtrs for visual contact before surfacing.
2	Lift streamer up in retrieval arm. A Norwegian buoy will be placed on either side of the bad section. CMU's removed from bad section.	Workboat caught on CMU's during lifting operation. Hydraulic failure on lifting arm. Communication problems between the leader and coxswain. Overstretching to add tamps/Remove CMU's. Getting hands caught between workboat arm and floats/CMU's	Damage section/CMU's d/t being caught on workboat. Streamer/CMU damage Confusion leading to danger. MOB/Strains Crush injury	Choose clear area for lifting operation. Hydraulic back up system correctly working. Clear comms between leader and coxswain. Do not overreach. Keep hands clear of pinch points.
3	Attach streamer clamp / harness to section and bring harness under tow.	Communication problems between the leader and coxswain. Failure of clamp Overstretching to add clamp Getting hands caught between clamp and workboat.	Clamp flying about/injury Injury d/t being struck by equipment. MOB/Strains Crush injury	Clear comms between leader and coxswain. Ensure equipment is inspected and or replaced on a regular basis. Inspect clamp before use Do not overreach. Keep hands clear of pinch points.
4	Power down the streamer before disconnection.	High voltage.	Possibility of electric shock.	Verbal confirmation from mother vessel of power status is required before proceeding.
5	Disconnect section, work boat is moving forward. Deploying new section from reel.	Work boat crew positioned incorrectly (the wrong side of the streamer) during disconnection. Tailbouy tangle	MOB/Crush injury Unnecassary exposure to untangle.	Leader ensure of all correct procedures will be in use by work boat crew and communicate clearly. Synchronisation between reel driver and coxswain
6	Clamp off at head of new section, break head of bad section using manual handling and bring bad section under tow on port side of workboat.	Manual pulling on bad section to take strain. Loss of bad section	Back injury. Unneassary exposure to retrieve.	Correct pulling technique Crew members taking strain on section to be sure they are comfortable with the weight before the section is broken.
7	Install streamer into head of new section and test. Return tow to streamer and remove clamp.	High voltage when powering up streamer. Clamp hitting crew when quick released Overstretching to remove clamp	Possibility of electric shock if section has ground fault. Injury MOB/Strains	Crewmembers to be clear of section during power up. All crew to stand clear. Do not overreach

8	Remove Norwegian buoys/add CMU's. Free streamer by using lifting arm. Work boat clear of streamer.	Overstretching to remove tamps/add CMU's. Getting hands caught between workboat arm and floats/CMU's Workboat getting caught on CMU's whilst clearing cable.	MOB/Strains Crush injury Damage to streamer/CMU's. Workboat out of coxswains control.	Do not overreach. Keep hands clear of pinch points. Choose clear area for release operation

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
1	Familiarization with equipment by reviewing service manual.	Incorrect operation	Personal injury and equipment damage.	Understand proper operation of equipment
2	Position equipment near hydraulic reservoir.	The purifier is quite heavy.	Personal injury if improper lifting or moving of purifier.	Plan the movements required of the purifier to the proper location. Have enough people to move the purifier safely. Use of proper PPE
3	Have electrician connect power to the purifier	High voltage	Electric shock	Insure the electrician is familiar with equipment electric requirements. Use of proper PPE
4	Remove the breathers from top of reservoir.	Design of hydraulic power pack.	Slipping while climbing up to the top of the reservoir.	Insure 3 points of contact at all times. Use of proper PPE. Insure there is no oil in the positions you will use for foot placement.
5	Connect inlet and outlet hoses to purifier.	Connection are close together.	Possibility of pinching fingers between fittings.	Use proper PPE (Gloves), use of proper tools. Offset the JIC fittings to make connection easier.
6	Put standpipe end of the hoses into reservoir thru the breather openings.	Design of hydraulic power pack.	Slipping while climbing up to the top of the reservoir.	Insure 3 points of contact at all times. Insure there is no oil in the positions you will use for foot placement. Have someone pass the hose ends to you after you are positioned on top of the reservoir. Use of proper PPE.
7	Prepare purifier for operation.	Understand the operation of purifier.	Equipment damage.	Read and understand the operating instructions.

I. JSA Information

1. JSA Title: Changing Lithium Acoustic Battery	2. JSA Location: MV Veritas Viking II
3. JSA No:	4. JSA Page No: Page 1 of 1
5. Date JSA Conducted : 06/12/2006	6. New Revision ?: New
7. Does a SOP already exist for this activity ? No	8. If Yes, then SOP Name / Number:
9. Title of Person who routinely does (or will do) the activity the JSA is being conducted for: Chief Observer, Senior Observer, Observer	10. Department of Person in Step 9: Observer
11. JSA Conducted by: Rashid Anwar/Tony Doyle	12. Supervisor: OS

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
1	Remove lithium battery from battery storage lockers and packaging	Body stressing Sharp Blades	Personnel injury due to improper lifting techniques when moving heavy boxes Personnel injury caused by cutting when opening packaging	Lift boxes correctly, bending at knees not at back Train personnel on the correct lifting techniques to avoid body stressing Obtain assistance Ensure correct tools are used for task - sharp knife Always cut away from self Wear gloves
2	Condition battery	Heat, radiation, electricity, chemicals and other substances	Explosion, electrocution, burns caused by battery becoming wet Faulty conditioner Damaged battery wiring	Ensure that working area is dry Conditioners becomes very hot after multiple uses and therefore allow to cool between batteries Inspect wiring prior to connecting conditioner
3	Remove CMX acoustic nose cone	Incorrect and poor condition of hand tools Possible venting of battery or water ingress Flying nose cone at high speed due to pressure buildup within CMX acoustic	Damage to personnel as well as equipment Explosion Self injury and other personnel nearby	Inspect all tools prior to use. Use correct tools for the job. Wear Lithium PPE and remove unit in open areas when sense that CMX nosecone is under pressure Always point nose cone away from self and other personnel
4	Insert conditioned battery into CMX acoustic and connect electrical terminals	Passing wiring through the centre of battery	Pinching and damaging of wiring leading to possible non operation of battery.	Take extra caution when passing of wire
5	Replace CMX acoustic nose cone and secure	Incorrect and poor condition of hand tools	Damage to personnel as well as equipment	Inspect all tools prior to use Use correct tools for the job Obtain assistance if required
6	Return prepared acoustic to storage rack ready for deployment	Body stressing Hitting objects with part of the body	Personnel injury due to improper lifting techniques when moving CMX acoustics Storage rack has other unit on, when adding unit can knock other units with arm	Train personnel on the correct lifting techniques to avoid body stressing Obtain assistance if required

Marine Acquisition JSA/Procedure Review

Veritas Viking2

06/04/2006

20323 --- Greater Bream 3D 2006

I. JSA Information

1. JSA Title: Transferring bad section from streamer reel onto storage reel. Transferring new section from crane deck to streamer reel.	2. JSA Location: Cable deck and crane deck
3. JSA No:	4. JSA Page No: Page 1 of 1
5. Date JSA Conducted: 06/04/2006	6. New Revision?: New
7. Does a SOP already exist for this activity? No	8. If Yes, then SOP Name / Number:
9. Title of Person who routinely does (or will do) the activity the JSA is being conducted for: Seismic Crew	10. Department of Person in Step 9:
11. JSA Conducted by: Observers	12. Supervisor: Jackie Delaughter

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
	Section chained off and under tension on towing clamp.	Clamp or harness failure Dropping towing harness. Trapping fingers in towing clamp. Trips and slips while working around towing harness and cable tools on deck.	Injury to body. Loss of streamer. Bruising, abrasions, broken bones Pinched fingers Muscle strain, Bruising, broken bones.	Always inspect towing clamp thoroughly before use. Obtain assistance if required. Use correct lifting techniques, straight back and bend knees. Keep fingers clear of pinch points. Slow down and take care while working around the tow clamp. Follow good housekeeping practices with tools on deck.
2	Power down streamer	High voltage	Possibility of electric shock	Correct communications with instrument room before disconnecting.
3	Streamer disconnected - Section end placed around " Pizza " wheel.	Clamp or harness failure.	Injury to body. Loss of streamer.	Do not straddle streamer whilst disconnecting. Use "pizza" wheels for directional changes to preserve bend radius.
4	Section spooled from streamer reel onto spares reel.	Non synchronized speed between streamer and spares reel can result in section becoming slack on spares reel and looping. Similarly by becoming too tight this may cause damage to section by passing over obstructions.	Damage to sections. Injury if hit by loose section becoming tight.	Ensure all personnel stay clear from the "line of fire". Good communication/line of sight required by personnel operating winches.
5	Disconnect bad section from the tail of the last good section on the cable deck.	Lifting/pulling equipment. Section dropped to deck once disconnected.	Personal injury. Equipment damage.	Obtain assistance when lifting equipment.
6	Connect new section from crane deck to streamer deck	Trip hazard. Lifting/pulling equipment. Potential cuts to hands. Exceeding bend radius of section. Skin damage to section.	Personal injury. Equipment damage.	Obtain assistance when moving equipment. Correct PPE worn when performing the task. Ensure clear path of section run.
7	Transfer new section from crane deck reel to streamer reel .	Non synchronized speed between streamer and crane deck reels can result in section becoming slack on deck and looping resulting in exceeding the minimum bend radius or catching around obstacles. Similarly by becoming too tight this may cause damage to section by passing over obstructions.	Irreparable damage to sections, potential core damage resulting in the possible scrapping of section as opposed to repair.	Ensure all personnel stay clear from the "line of fire". Good communication/line of sight required by personnel operating winches. Use "pizza" wheels for directional changes to preserve bend radius.
8	Connect new section to the module in the cable clamp.	Trip hazard. Lifting/pulling equipment. Strops on cable clamp fail under tension. Damage to end connector of section when connecting up.	Personal injury. Equipment damage/loss.	Be aware of the tension on the cable clamp and do not straddle the new section when connecting it. Inspect cable clamp and strops prior to use. Ensure personnel

				know how to correctly connect a section up, (locating pins/new 'o'-rings etc).

11. JSA Conducted by: C. Bradshaw/Melissa LI	12. Supervisor: ChNav/OS

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
	Select Line	Wrong Line shot	Production lost	The selected line will be based on the required coverage.
	Select and check coverage	Wrong coverage selected	Production lost	Vessel offsets will be figured out to determine how the coverage can be acquired. If either of the vessels will be within the close pass requirements of the obstruction.
	Check the predicted feather angle to ensure it is safe to proceed	Gear approached Rig	Damage to gear	Use current prediction software, tidal charts, tide tables, and ADCP data to determine the currents at the time of the close pass. Use this information to determine the vessel offsets in relation to the coverage.
	Plan escape route	Gear approaches Rig	Damage to gear	If the vessel offsets warrant a close pass, the ChNav/PM/OS must be consulted to make sure a Close Pass Request has been made and approved.
	Approach to line	Gear approaches Rig	Damage to in water gear.	Monitor Streamer compasses and ADCP current profiles on line change.
	Monitor Streamer compasses and ADCP	Currents are not as predicted	Damage to in water gear	During run-in to line, monitor the streamer compasses and ADCP data to confirm the currents are as predicted.
	Monitor Weather	Adverse weather conditions	Damage to in water gear	Monitor the weather during the line change. If the weather is deteriorating it may be necessary to call off the close approach. Predetermined limits will have to be checked against the current weather.
	Start of Line	Gear approached Rig	Damage to in water gear	As the line is started, continue to monitor streamer compasses and ADCP.
	Monitor currents	Wrong currents	Damage to in water gear	If the currents are as predicted proceed to the close pass JSA.
	Abort line if currents are going to bring the equipment into the Rig	Gear approaches Rig	Damage to in water gear	If the currents are not as predicted, and the in water gear poses a risk of striking the obstruction, abort the line.
	Confirm escape route coincides with the currents	Gear approaches Rig	Damage to in water gear	Confirm with PM or OS as to the best escape route from obstruction to allow safe passage of trailing equipment.

JSA/Procedure Review
Veritas Viking2
05/20/2006

20323 --- Greater Bream 3D 2006

I. JSA Information

1. JSA Title: Streamer Cleaning From STBD Workboat - Ammended from Port Workboat Procedure.	2. JSA Location: Workboat
3. JSA No:	4. JSA Page No: Page 1 of 1
5. Date JSA Conducted: 05/20/2006	6. New Revision ?: Revised
7. Does a SOP already exist for this activity ? No	8. If Yes, then SOP Name / Number: Streamer Cleaning from Workboat
9. Title of Person who routinely does (or will do) the activity the JSA is being conducted for: All	10. Department of Person in Step 9: All
11. JSA Conducted by: Andy Perkin, Manny Ollada, Mike Wells	12. Supervisor: Paul Turpin

II. JSA Sequence

A. No	B. SEQUENCE (Basic Task Steps Start to completion)	C. Potential HAZARDS	D. RISK (associated with the HAZARD)	E. RISK Mitigation (SOP / Actions proposed to render the risk ALARP)
1	Toolbox Meeting Locating the streamer - Follow instructions given by Navigation to bring the W/B into a position where the streamer is visible. - All W/B personnel watching for streamer.	Confusion among as to personnel task W/B drives over streamer causing damage	Danger in operation Damage to streamer	Hold toolbox with all members present Instrument room should not to bring streamer shallower than 3m until W/B has visually located streamer. Navigation to regularly update the W/B with information on their position relative to the Streamer (distance off etc) Navigation and Workboat via radio linked Buoy link display to maintain constant observation on range and bearing to proposed target. Constant radio contact between Instrument room and workboat un updates in position changes.
2	Streamer sighted - Coxswain maintains a course which is parallel to the streamer and matches speed	Coxswain loses sight of streamer and crosses over / collides with streamer.	Damage to streamer	Instrument room not to bring streamer shallower than 3m until W/B reports that they are in a safe position alongside the streamer. All W/B personnel to keep watching the streamer at all times and advise coxswain if getting too close.
3	Streamer surfaced - W/B sends instruction to Instrument that streamer is on the surface	Coxswain loses sight of streamer and crosses over / collides with streamer	Damage to streamer	All W/B personnel to keep watching the streamer at all times and advise coxswain if getting too close.
4	Streamer taken into cleaning tray using hydraulic lifting arm. -	1) Coxswain loses sight of streamer and crosses over / collides with streamer 2) Failure to maintain matching speeds 3) Failure of lifting arm during retrieval	1) Damage to streamer 2. Damage/loss of CMU 3) Unable to pick up or release streamer	1) Once arm operator confirms they are ready to lower arm and retrieve streamer and coxswains agrees they are ready coxswain manoeuvres workboat towards streamer whilst continuing to match speeds. Lifting arm operator to guide coxswain to suitable position so that streamer can be retrieved safely, constantly advising coxswain of streamer position relative to workboat and lifting arm. 2. All other personnel apart from lifting arm operator to maintain visual on the streamer and advise of proximity of nearest CMU - Appropriate instruction given to coxswain as to either speed up or slow down. 3) Lifting arm tested prior to use. All crew personnel

				Informed of the use of the emergency roller release mechanism
5	Streamer secured in tray	Loss of W/B engine power	W/B unable to maneuver on streamer	One crew member positioned at tray at all times so that streamer can be jettisoned in emergency.
6	Cleaning of streamer - W/B moves forward along streamer while crew clean it	<p>1) Loss of W/B engine power</p> <p>2) Cleaning rope gets caught on kink in streamer skin</p> <p>3) CMU caught in roller</p> <p>4) Algae on streamer</p> <p>5) Slippery surfaces and deck in W/B</p> <p>6) Incorrect rope used for cleaning Rope becoming caught on weight/ module/ connector jacket & does not break under the increased tension.</p> <p>7) Rope travelling fast through hands, sharp barnacles</p> <p>8) Being hit by flying objects (barnacles)</p>	<p>1) W/B unable to maneuver on streamer</p> <p>2) Damage to streamer</p> <p>3) Damage to streamer and/or CMU</p> <p>4) Skin contact with Algae causing adverse reactions</p> <p>5) Slip hazards</p> <p>6) Damage to Streamer - risk to boat stability.</p> <p>7) Cut to hands, burns, Skin Infections</p> <p>8) Eye infections / Facial abrasions</p>	<p>1) One crew member positioned at roller at all times so that streamer can be jettisoned in emergency</p> <p>2) Continuous communication between Coxswain and crewman at roller so that upcoming hazards are spotted early and W/B speed adjusted as needed. Low breaking strength polyprop rope to be used</p> <p>3) Continuous communication between Coxswain and crewman at roller so that upcoming hazards are spotted early and W/B speed adjusted as needed</p> <p>4) Application of Sun-block helps prevent rashes d/t contact with algae</p> <p>5) Crew should try to keep slime and barnacles from building up in the work area of the boat.</p> <p>6) Only polypropylene rope with a low breaking strain to be used. Plexus or Dextron brands must NOT be used, or any type of rope which has a tendency to 'pinch' on a section, get caught on weights etc & is unable to break due to a very high breaking strain. Coxswain informed of any potential snagging areas as they approach - workboat speed adjusted to compensate for possible snagging. Crew members to keep constant communication with coxswain as problem areas pass through cleaning rope.</p> <p>7) All crew must wear gloves at all times during cleaning process</p> <p>All crew must wear safety glasses at all times</p>
7	Releasing Streamer	<p>1) Cleaning rope removed from streamer. Lifting arm operator raises and swings arm to release position.</p> <p>2) Weight of streamer prevents it from sliding off and over the lip on the side of the tray.</p>	<p>1) Damage to Streamer - risk to boat stability.</p> <p>2) Streamer unable to be released - Damage to streamer, risk of boat instability.</p>	<p>1) All crew confirm that cleaning rope has been removed. and equipment has been stowed clear of streamer. Lifting arm operator informs coxswain he is ready to position arm for release - Coxswain confirms he is also ready.</p> <p>2) Suitable forward and port movement employed to ensure the streamer pulls clear of the W/B. At heavier parts of the streamer, i.e towards the head of the streamers emergency quick release mechanism to be used. All crew members informed of quick release mechanism. Coxswain to be kept informed</p>

				of streamer position during release and if quick release is required.
8	Maneuver clear - W/B moves a safe distance from streamer	1) Coxswain loses sight of streamer and crosses over / collides with streamer 2) Other streamers on surface to Port of the W/B	1) Damage to streamer 2) Damage to streamer	1) All W/B personnel to maintain visual on streamer until workboat is well away from the streamer 2) W/B to inform / confirm with instrument room that there are no other streamers near the surface to the port side of the workboat before maneuvering to next objective / returning to VII
9				

III. JSA Acceptance of Risk Tolerability

Veritas Viking2
Proposed
06/19/2006
20323 --- Greater Bream 3D 2006

Initiation

Initiation	
	Reference No: MOC-V2-PMVV6QVU56
Originator: PM Veritas-Viking2	Area of operation: Bass Strait, Australia
Project: Greater Bream 3D	Nature of change: Equipment
Type of change: Temporary	
Description of change :	
Replacement of usual support vessel to perform at sea refuelling for Veritas Viking II. Usual support vessel is OMV Voyager, replacement vessel is Lady Kari-Ann.	
Justification of change :	
OMV Voyager will be undergoing essential maintenance when refuelling of the Viking II is required. To minimise disruption to the survey a replacement vessel is required in order to eliminate the need for the Viking II to make a port call for refuelling.	
Potential consequences of change (positive and negative):	
+ve Downtime for refuelling reduced. +ve Crew are experienced performing refuelling at sea.	
Mitigation steps and special precautions :	
Lady Kari-Ann has been audited by and is working for ExxonMobil. Refuelling at Sea procedures reviewed by Lady Kari-Ann Officers and Crew. Connections are dry break couplings. Fuel hoses to be used are new and certified, onboard the Viking II.	
Is training required: No	
Describe Training:	
Cost:	
Does change increase risk: No	

Pre-mitigation Risk Score

Probability:	Exposure:	Consequence:	Risk Score
Conceivable (but very unlikely)	Infrequent	Serious Injury	8 = Low Risk

Comments and attachments :

Attached are the Lady Kari-Ann specifications and Veritas Viking2 offshore vessel-to-vessel transfer procedures, JSA's and risk analysis.

Marine Acquisition
Veritas Viking2
Proposed
05/19/2006
20323 --- Greater Bream 3D 2006

Initiation

Reference No: MOC-V2-OSVV6PXCQZ	
Originator: OS Veritas-Viking2	Area of operation: Bass Straight
Project: Greater Bream 3D Job No.20323	Nature of change: Personnel
Type of change: Permanent	
Description of change :	
Listed in the EAPL Greater Bream 3D Marine Seismic Survey Bridging Document. / SIMOPS / Manning Levels / 1.	
The Captain, Officer on watch, EAPL Onboard Representative and Party Chief will be on the bridge at the time the vessel is 1500 metre from the point of entry into the 500 metre zone They will remain the bridge until the vessel and all trailing in-water equipment is clear of the 500 metre zone.	
The proposed change is:	
Either Norwegian or Australian Captain, Officer on watch, EAPL Onboard Representative and either Party Chief or Operations Supervisor / APM will be on the bridge at the time the vessel is 1500 metre from the point of entry into the 500 metre zone They will remain the bridge until the vessel and all trailing in-water equipment is clear of the 500 metre zone.	
Justification of change :	
Due to the amount of close passes in any 24 hour period, fatigue will prevent any one person (ie Captain and Party Chief) from being present at every close pass.	
Potential consequences of change (positive and negative):	
Captain and Party chief will not suffer undue fatigue through sleep deprivation. Party Chief and Captain will still be available at short notice if needed.	
Mitigation steps and special precautions : Thorough hand-overs and overlapping of shifts between both Norwegian and Australian Captains and the Party Chief and Operations supervisor / APM.	
Is training required: No	
Describe Training:	
Cost: Nil	
Does change increase risk : No	

Pre-mitigation Risk Score

Probability:	Exposure:	Consequence:	Risk Score
Unusual but Possible	Frequent	Important	25 = Moderate Risk

Minutes:

General Crew Safety Meeting .

General crew safety meeting was called in the instrument room - Client representatives and ships bridge crew also present.
Meeting commenced @ 12:15PM Local

Previous meeting's minutes were read to the crew highlighting new AIM procedures and baggage control during Helo operations .

New issues raised :

Drill PPE

Correct PPE for PRE planned drills - Recent confusion over hats vs hard hats for drills . Crew informed that as of today correct PPE for all Pre Planned drills was to be Long Sleeved coveralls , covered shoes or steel toed boots and a hard hat . For all "real" drills crew were informed that it is recommended to keep a pair of coveralls in their cabins and a hat of some description , baseball cap , beanie etc , and that under no circumstance were they to go below to retrieve a hard hat . If coveralls were not close at hand any long sleeved , long pants would be sufficient .

Communal Toilet Use.

Due to problems with the vacuum toilet system on the vessel , some communal toilets were out of action and that due to the large number of personnel onboard using a reduced number of toilets that all were requested to maintain a high standard of hygiene .

Health:

Newly arrived rotation informed of cholesterol and blood pressure tests being conducted by onboard medic for all those interested . Take up of this has been good .

Gymnasium.

Crew informed that running machine was out of use until new part arrives and that the machine should not be used until such time .
Crew also reminded of good housekeeping in the gym and that all weights should be replaced after use .

VGO

Crew informed off deadlines for VGO benefit forms and that individuals could either send these themselves or see Ch.Obs or OS who would scan and send on their behalf .

Safety:

Captain announced new onboard fire fighting training DVD open for all to watch and participate in with a self test exam .
Crew reminded to maintain vigil on new hires to the boat especially during the upcoming end of job retrieval and transit .

Meeting closed at 12:30PM Local

Minutes:

A general meeting was called in the Instrument room to discuss changes to AIM observation procedures and also to advise of changes to crew change Helo procedures.

The meeting was opened at 12:30.

The first item was to advise people that a trial was to commence whereby individuals would submit their own observations to Lotus Notes. AIM cards will still need to be used and submitted in the usual manner, but the actual submission to Notes would be by the individual.

This will allow the Scribe a little more time as sometimes, with large numbers of observations the Scribe can get quite bogged down. The scribe will still need to read all observations as it is the Scribe who selects the six best observations for the month that the best observation for the month is selected from.

Melissa Li was awarded the best observation for May for her observation of a headfloat deployment. EAPL Client kindly supplied an ESSO watch as this months prize.

All crew were told that if they had any problems entering their observation into Notes to see a Senior or a member of the AIM Committee and they would be given help.

A question was raised regarding space for feedback on the AIM form, It was explained that the feedback sections on the back of the card serves for both observers and the person being observed comments.

It was also explained by the OS that for this Crew Change, flight cards would be issued to individuals as well as baggage tags, as flights may be in quick succession. All flight cards will need to be collected by the Heli Marshal prior to the flight boarding and announcements will be made as to which flight is landing next.

There are also dedicated baggage areas numbered by flight on the deck. All baggage is to be placed into its respective area prior to the first flight landing.

EAPL Client Rep, Mr Dave Danyluk also presented an ESSO watch to Jun Manalang as this weeks outstanding contributor to safety onboard the V2.

Minutes:

Meeting opened at 12:40 in the instrument room:

The meeting, held in the Instrument room was primarily to discuss QHSES issues that may arise during the upcoming 2 boat undershoot of Bream Platforms A and B.

Mike Shirley explained the basic procedure as well as outlining hazards that are unique to 2 boat operations.

Mike also explained that if at any time anyone saw anything that seemed to be out of the ordinary, not to hesitate but to contact Either himself, The PM, OS, GS, Ch Observer or Ch Navigator. Mike further explained that this was a safety first operation both to the trailing equipment, vessel and most importantly personnel.

Dave Danyluk, lead client made a presentation on behalf of EAPL to Lenny Tankard for his continuing efforts in QHSES.

The meeting was then closed with the Operations Supervisor again reiterating the need for safety of equipment and personnel to remain at the forefront of priorities for the survey.

Minutes:

General Safety Meeting:

Prior to Esso Aus Pty Greater Bream Survey

Issues Highlighted:

Chief Observer reminded crew of safe working practices when conducting manual activities in light of recent incidents onboard - Reaffirmed need for two people to carry objects that may be deemed as " heavy" especially in rolling seas.

Crew reminded of house keeping practices in light of recent incidents involving incorrectly strapped items on top deck area as well as keeping work areas clear of trip hazards.

PPE highlighted for upcoming deployment for Esso Aus Pty Greater Bream Survey and the need for senior personnel to maintain a vigil on the large numbers of new hires currently onboard.

PM Announcements:

PM informed all seismic crew of the importance of PPE and safe working practices especially in the current area where wind and sea conditions can be expected to be considerable.

Informed crew of upcoming helicopter deck audit to be conducted on Friday morning and personnel who would be departing vessel .

Client Comments:

Esso head client Dave Danyluk expressed Esso policy on HSE and standards and the importance to ensure that the survey was conducted in accordance with Esso vision - " No one gets hurt "

Open Floor:

Chief mechanic, Mike Haarmans highlighted correct procedures for removing and replacing gate on stern chute when retrieving and deploying tailbuoys and headfloats - Reminded all members involved to replace gate when the chute was not in use and to ensure safely lines were correctly secured if entering onto the chute.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jasbir Singh	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Broken glass light lens found on deck	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): An outside walkway light lens (portside) was noticed lying on the deck. All light lenses along the walkway were present. It appears to have been an old lens which had been replaced during drydock and left resting on the deck above. The lens had fallen to the deck below leaving a small amount of broken glass.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: S.Hainsworth	

Recommendation and Actions				
Immediate causes: Bad housekeeping				
Immediate actions to prevent recurrence : Remove the broken glass, checked other lights were safe.				
AIM categories:				
AIM behaviors:

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jasbir Singh	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description
Brief description: Decking on cable deck not replaced properly after dry-dock causing trip hazard
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): When the vessel was in dry-dock the steel support structure for the port and stbd side cable decking was replaced due to corrosion. The original deck plating was then placed back down with edges overlapping, screws not secured, and gaps where there were no gaps before. The steel deck plate had fitted perfectly before dry-dock. Now it will need to be lifted and replaced properly.
    
Breakdown agency: Machinery & mainly fixed equipment (plant) None
Witnessed by: Observers

Recommendation and Actions
Immediate causes: Shoddy workmanship
Immediate actions to prevent recurrence : Lift and replace deck plate

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jasbir Singh	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Deck support in wrong position.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams):	
When carrying out tests on launch and recovery of vanes it was observed that a support under the mesh decking on the starboard side was in a position that caused the starboard vane rope to rub as it is hauled in or let out. Some of these supports were replaced in the dry dock and this may have been installed in the wrong place.	
 100_0150.jpg	
Breakdown agency: Other & unspecified None	
Witnessed by: Gun Mechanic	

Recommendation and Actions				
Immediate causes: Possibly put back in wrong position when replaced. Ship yard welder put it back in the center supporting join's without realizing that the vane rope would rub when moved in and out.				
Immediate actions to prevent recurrence : Compressor Mechanic will cut out and move to better position.

Supervisor: Jasbir Singh	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description

Brief description: Mess table top not secured.

Describe in detail how the event occurred (attach any relevant documents / images / diagrams):

Alterations to a table in the Mess during the recent dry dock has not been completed.
The table top was cut to allow easier access around the table. The off-cut has been used as a new table top for food storage during meal hours.
This top is not secured in any way to a permanent structure.
Due to a tank inspection point and sounding pipe being directly below this new position for the table, it has been made removable with nothing attaching it to the vessel.
Other alteration's discussed prior to the dry dock for this area would have given access to the sounding pipe with the bench permanently fitted.
Smaller chairs were also meant to be supplied to make easier access for uses.
The hole in the top of the bench was not covered. At the moment a biscuit container covers the hole.

000_0018[1].jpg 000_0021[1].jpg 000_0019[1].jpg

Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: PM	

Recommendation and Actions

Immediate causes: Drydock alterations were not completed.

Immediate actions to prevent recurrence : Follow up by SPO and the alterations completed to a safe standard.

Event Description

Brief description: Money and Camera stolen.

Describe in detail how the event occurred (attach any relevant documents / images / diagrams):

While staying in a hotel in Melbourne on the way to the vessel for crew change on the 25th May my room was entered by a person who had picked the lock of a door which lead to an adjoining room.

I was in the shower at 06:55 when I heard a noise form my room. I jumped out and put a towel around myself before going into the main room. At this time I saw a man leaving the room through the door to the adjoining room. I tried to get to him before he closed the door but I was not able to reach him.

I called the reception and asked for a security guard as someone had just been in my room and taken some cash.

I then put some jeans on before going out to check the next room. As I left my room I saw a mans head sticking out of a hatch in the front wall of the next room. I ran over before he could close it and told him to give my money back. He denied taking it and tried to close the hatch. I hit the hatch open and told him to give me the cash. He gave some coins back and said sorry. I told him there was more and he gave me the note back as well.

While this was happening I was also looking for the security guard so I could enter the room and see if any other belongings had been stolen.

I kept the front door to my room open and called reception again telling them the guy was still in the room next to mine and he had taken cash from me. I then went back to the front of the room and waiting outside the next-door room.

After 15 minutes I looked over the balcony and saw a guy standing below. He asked me which room I was from. He then said he was the security guard. He asked if the guy was still in the room and I told him no-one had come from the front door.

After another 20 minutes another guard arrived. He went into my room and tried to open the internal door. He asked if it was left open and they had made a mistake. I always check that any internal doors are secure if there is one in my hotel room.

He them emptied my bag and asked me to check if anything else was missing. I told him my Camera was gone.

He went to the reception and got another key to the next door room.

He entered the room and found two men but no camera.

The police had been called at 07:05 but did not arrive until 07:55.

They asked for details of the man I had seen. When they came back they informed me the man was not their but there was two other men who were well know criminals from another area of Melbourne. They had been staying in the room over night.

The police searched for my camera but found nothing. They said there was not much hope of finding it and that they were going to let the men go.

I gave the police the operating manual for the camera, which was only 3 weeks old in case they find it at a later date.

Breakdown agency: Other & unspecified None	
Witnessed by: Ray Hales	

Recommendation and Actions

Immediate causes: Theft

Immediate actions to prevent recurrence :
Where possible rooms without doors to adjoining rooms should be used.
Possibly insist that dead bolts be fitted to internal doors between rooms.

Near miss type: Safety of people Environmental Involved assets

AIM categories: Conditions & Housekeeping (work area)/Work areas
free of slip & trip hazards
AIM behaviors: New Category/Behav

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: 3590 drives sliding back and forth	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): The retaining screws belonging to the tray which secures both tape drives 0 and 1 were found to be loose and thereby allowing the 2 tape drives to slide back and forth. The 4 retaining screws were tightened back up and the other tape drive bays were checked to ensure that their were no other loose connectors.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Greg Campbell	

Recommendation and Actions											
Immediate causes: -											
Immediate actions to prevent recurrence : Tightened screws

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: J. DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Loose pin	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): While inspecting the Odin towpoints during streamer retrieval, it was noticed that the pivot eye pin on unit # 7 had backed out approx 10mm. The split pin that holds the pivot eye pin in place was also missing. If left in this condition the pin could have backed out all the way causing the towpoint to drop to the deck. Pivot eye pin and split pin have been reinstalled, and all other units checked; this IR is considered closed.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Comp mech	

Recommendation and Actions				
Immediate causes: Split pin must have popped out as pin rotated.				
Immediate actions to prevent recurrence : Stopped retrieval operation, dropped towpoint down, pushed pin in to it's proper depth and installed another split pin. Used a different type split pin.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie de Laughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Birds and SRD's blocking stairwell	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): As I was storing birds I noticed that a pile of birds and SRD's were blocking the stairwell. I removed these promptly, however there is a lack of secure storage space when all the gear is onboard, this means that in rough weather the devices that are left on the deck may move again towards the stairwell.	
Breakdown agency: Other & unspecified None	
Witnessed by: Howard Hewison	

Recommendation and Actions				
Immediate causes: Poor storage when all gear onboard				
Immediate actions to prevent recurrence : Look into methods of storage systems to improve situation

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie de Laughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Icy cold water comes gushing down from top deck onto Navigator below on Tailbuoy!	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): I was securing tailbuoys for rough weather. While on top of one of the tailbuoys some icy fishy smelling water was swept along the top deck making its way through the open grating and onto the tailbuoys on the port side. I was at this time on a tail buoy and had to rapidly move for fear of the icy smelly water soaking me.	
Breakdown agency: Animal human & biologic agencies None	
Witnessed by: Vera Quinlan	

Recommendation and Actions				
Immediate causes: Observers cleaning the streamer deck with water after retrieval				
Immediate actions to prevent recurrence : Wait until the top deck is cleaned before going under the grate

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Whilst packing away the hydraulic arm in the workboat, it was noticed that the quick-release handle was jammed.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Whilst out in the Starboard Workboat doing some cable work, it was noticed that the quick release on the hydraulic arm was jammed. Upon completion of the work the hydraulic arm was packed away, whilst removing the cable tray and folding down the horizontal arm, the release handle was jammed in the locked position, it took a pair of pliers and a screw driver to free it. This handle is used as the quick release incase the streamer needs to be released in an emergency.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Pete Hawkins	

Recommendation and Actions									
Immediate causes: Locating pin was slightly bent and forced into position at the start of the job									
Immediate actions to prevent recurrence : Quick release pin and handle were examined by the mechanics and myself. The problem was found and the relevant personnel were informed. If the pin is inserted correctly when setting up then it releases fine.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Crew-Member Suffering from Swollen Elbow	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Patient complained of swelling at the elbow, with some pain and restricted movement. Patient said that there had been no injury and no task that would have brought on the pain. Patient does have some history of arthritic complaints.	
Breakdown agency: Animal human & biologic agencies None	
Witnessed by: Medic Constante Mendoza	

Recommendation and Actions				
Immediate causes: Possible gout / mild arthritis.				
Immediate actions to prevent recurrence : Non-prescription Ibruprofen 1-2 tablets (200 mg / tablet) three times per day given, plus Voltaren gel to help reduce pain and swelling. Patient's own medicine for arthritis (Colchicine 500mcg 3/day) taken as needed. Patient advised to see their physician when they get off the vessel for their next break.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: FRC starter inoperable/emergency starter very slow and engine or linkage squeaking when bucket adjusted under low/medium RPM.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): During today's MOB drill it was noticed that the FRC took too long to start, even for a cold engine. The regular ignition would not work at all, with no response and the engine would not turn over. The emergency starter was used but this only worked after a few tries (approx 30 seconds). There seems to be an electrical problem somewhere. Squeaking noise like a slipping fan belt was heard when the bucket was adjusted at medium/low RPM. Apart from that the boat ran really well.	
Breakdown agency: Transport Water transport	
Witnessed by: L Hayden/P Cooper	

Recommendation and Actions									
Immediate causes: Possible short on ignition panel, loose linkage									
Immediate actions to prevent recurrence: Would like an electrician/engineer to look at and possibly come out in the FRC at some stage and see if there is a problem.									
AIM categories:									
AIM behaviors:									
TapRoot:

Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Stbd workboat painter line brought inboard and put underneath light fitting.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Doing coxswains pre-launch checks I noticed the bowline painter was inboard. The painter had been brought inboard on the 03 accommodation deck and put underneath a floodlight fitting for some reason. If the workboat had been launched like this the painter line may have been damaged and parted, the light fitting been ripped out, or worst case, the boat flipped over. The davit operator was informed and he immediately freed the painter line. IR can be closed.	
Breakdown agency: Transport Water transport	
Witnessed by: Les Hayden/Lenny Tankard	

Recommendation and Actions	
Immediate causes: Lazyness/Forgetfulness/Failure to inform other crew of actions.	
Immediate actions to prevent recurrence : Freed the painter/This report

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Pinched left middle finger	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams):	
Patient stated that whilst trying to remove a sheet of steel grating from a rack of sheet steel, the stack moved after heavy ship roll and pinched the tip of the middle finger of the mate as he was trying to handle the grating.	
Time of Incident : 1045 hours(local) Place of Incident : Embarkation area portside Date of Incident : 14 June 2006 Time Examined : 1050 hours(local)	
Injury Sustained:	
Small cut at left middle finger just above the nailbed (+) Slight swelling and bruising Good range of motion of the affected finger	
 SAFIR 24-06.doc	
Breakdown agency: Other & unspecified None	Breakdown mechanism: Being hit by moving objects
Witnessed by: G. Honiss, D. Tambi, Medic

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Plotter lid open and unattended, falling heavily.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): During plotter roll change out, the plotter head was raised, old roll removed, and plotter left unattended with lid left in the open (raised), position. The lid fell heavily due to vessel motion. This could have damaged the equipment or more seriously, inflicted injury if hands were in the way. The support rams on this particular plotter no longer have the capacity to hold the lid open in anything but calm seas. Technician will replace rams with onboard spares.	
Breakdown agency: Powered tools appliances & equipment None	
Witnessed by: P Jones	

Recommendation and Actions				
Immediate causes: failure to appreciate weight of lid, and it's inherent instability.				
Immediate actions to prevent recurrence : advised individual of need to support lid or leave in down position when unattended.

Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Slip hazard, oil on deck	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Observed small amount of hydraulic oil on streamer deck just aft of reel 8. Cleaned up oil using absorbent mats. Oil was leaking from a connection in the hyd pipe supplying port vane winch.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Observers	

Recommendation and Actions				
Immediate causes: Slow oil leak from connection in pipe supplying hyd oil to port vane winch				
Immediate actions to prevent recurrence: After cleaning up oil and leaving absorbent mat in place to catch further drips, discussed problem with Ch Mech. Maintenance cannot be carried out until port vane has been retrieved onboard. Problem will continue to be monitored until repairs take place.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Bench grinder wheel was damaged	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Whilst walking past the bench grinder it was noticed that the grinding wheel had been chipped by something causing damage to the wheel.	
Breakdown agency: Powered tools appliances & equipment None	
Witnessed by: Steve Dyer	

Recommendation and Actions				
Immediate causes: Haste, lack of attention				
Immediate actions to prevent recurrence : Bench grinding disk was replaced, more care and attention is needed when carrying equipment around the vessel. IR considered closed.

Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Vessel blackout.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams):	
During routine TM Master planned maintenance, the battery charger to battery DC3 was turned off for electrical testing, resulting in loss of supply power and subsequent blackout for 12 minutes.	
Vessel propulsion unaffected, however, no indication on bridge that the port ME was serviceable. Azimuth thruster locked down and engaged as a precaution. Chase/ support vessel 'Swissco 168' in position to take-up tow.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Chief engineer	

Recommendation and Actions				
Immediate causes: Loss of power to switchboard electronics, tripping breakers.				
Immediate actions to prevent recurrence : Notices have been placed advising personnel not to switch off battery chargers.				
Near miss type: <input type="radio"/> Safety of people <input type="radio"/> Environmental <input checked="" type="radio"/> Involved assets

V2-GNR-06-0039

Job Information	
Job Number: 20323	Client Name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job Name: Greater Bream 3D 2006
Area of Operation: Gippsland Basin, offshore Australia	Region: APAC
General Incident Information	
Date of report: May/28/2006	Date of observation: May/26/2006
Report completed by: Paul Jones	Local time observed: 10:00 AM
Document author: Tango Veritas-Viking2	
Activity at time of incident: Recording At sea None	Where observed: Recording room
Commendation received from:	
Good News Description	
Description of why this form is being completed (Excellence / best practice): 3590 drive bays fitted with new doors improving environment for drives, and users.	
Describe in detail what happened , who was involved (attach any written commendations , letters, reports, citations, relevant documents / images / diagrams): Our onboard technician, through his own initiative, researched the option of fitting our 3590 drive bays with alternative doors, sourced necessary parts, and fitted them. This was not simply a swap out of doors, but a complete remounting of the drives in the bays, with some degree of modification involved. The resulting bays are now entirely enclosed - the new doors close fully and provide a comprehensive barrier to the ingress of dust. They also keep the temperature inside far colder than previously, this is apparent with every tape removed from the drives! Furthermore, the improvement also noticeably reduces noise from the drives, making for a quieter work area.	
 New3590Doors.jpg	
Recommendations

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: J deLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Flouro Tubes Unclipped From Light Fittings	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): During a cross audit of the recording room the light tubes above the observers station were found to be unclipped from the fittings and as such were free to vibrate around, possibility of arcing out. The reason given for this was, the observers get a headache if the light is on.	
Breakdown agency: Animal human & biologic agencies None	
Witnessed by: G Goddard	

Recommendation and Actions				
Immediate causes: Laziness to remove the light grille and store the tubes, and also the fitting still looks normal at first glance				
Immediate actions to prevent recurrence : Re-Installed tubes into fittings. The ship electrician will install a local switch for this light enabling it to be switched off independently from the others in the circuit.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Burn Kit not in its proper place	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): During weekly inspection, noticed burn kit not in its usual place in the engine control room. The burn kit was found on the bookshelf. Emergency kit like this should always be accessible and easily be seen. Placed and secure it on the wall near the First Aid kit and Eye wash station where everyone could see. IR considered closed	
Breakdown agency: Other & unspecified None	
Witnessed by: Jun Manalang, Einar Aga	

Recommendation and Actions				
Immediate causes: Lack of thought, perhaps				
Immediate actions to prevent recurrence : Placed and secure it on the wall near the First Aid kit and Eye wash station where everyone could see.

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Work boat life jackets repacked incorrectly	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams):	
<p>Whilst performing monthly life jacket inspection and 8 hr air integrity test it was found work boat #8 jacket's whistle was not fastened into the jacket correctly, the whistle had been tied off onto the top (neck) bladder retaining strap with a cord only 100 mm long, this made it impossible to achieve oral inflation should the need arise.</p> <p>Life jacket WB #2 was also packed incorrectly, the fault being oral inflation tube trapped under breast strap, this would make oral inflation if not impossible extremely difficult to say the least. Life jacket #2 was also one of several jackets having the wrong bladder number fitted into the jacket, in this case WB bladder #6, up until this test we have always kept the jacket's and bladder's as a unit, this helps maintain our records giving us accurate information on initial put into service dates, once tested all the bladders will be returned into their correct number jacket.</p>	
Breakdown agency: Non-powered hand tools appliances & equipment	None
Witnessed by: L. Tankard	

Recommendation and Actions			
Immediate causes: Not fully understanding the test procedure, inexperience, haste.			
Immediate actions to prevent recurrence : Whistle was remove, fitted with a new longer lanyard and reattached in the correct position. Inflation tube was freed from under strap and bladder removed with all incorrectly fitted ones all to be matched back with corresponding jackets upon completion of testing.

Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Hose keys missing	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Whilst performing a fire drill, fire team 3 was instructed to initiate boundary cooling, the Stbd muster station hose and the Stbd crane deck hoses were removed from their storage boxes, it was then noticed that the two hose keys required for connection were missing from the Stbd crane deck box, hose keys from the muster station box had to be passed over and the hose was then assembled. This box is a brand new replacement for one damaged on the resent transit.	
Breakdown agency: Non-powered hand tools appliances & equipment None	
Witnessed by: L. Tankard	

Recommendation and Actions	
Immediate causes: Keys have not been replaced into the new box when fitted ?, although Marine crew have assured me that both keys had been stowed with the hose and nozzle.	
Immediate actions to prevent recurrence : Marine crew are to source and replace keys

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie De Laughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Streamer reels 8 & 7 moving independently during streamer operations.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Streamer 2 was being disconnected from streamer 1 whilst stacking streamers. I suddenly noticed there was too much slack in streamer 1 (reel 8). A crewmember immediately pointed out that streamer 1 was deploying slowly by itself we all moved clear of the area whilst the remote box was recovered and the tension was again taken up on the streamer reel. Streamer reel 7 has also been seen to creep in by itself recently.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Hayden,Ollada,Wells,Papio,Flower	

Recommendation and Actions	
Immediate causes: Defective reels mechanism (possibly sticky handles).	
Immediate actions to prevent recurrence : Reels are being watched closely whilst in use. The hydraulic valve for both reels is now being closed every time the reels are not in use preventing movement. The manual hydraulic handles will be stripped and inspected as soon as the current streamer work is complete.

Area of operation: Gippsland Basin, offshore Australia	

Event Description
Brief description: henriksen hook
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): After completion of streamer work in the starboard workboat the lifting frame was returned to its centre position. At this time it was noticed that the Henriksen hook would not stand upright but fall over to port. Investigation confirmed that the internal spring that hold the hook upright had broken and would allow the hook to fall to port but would still stop the hook falling to starboard. The hook was lashed to stay upright and the boat recovered without further incident. A replacement hook will be ordered ASAP.

Event Description	
Brief description: Defective cutting disc in chapsaw.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Ships crew asked could they borrow the chapsaw, they had only taken the saw to the Gun deck hot work area to set-up and had not as yet used it, I was asked to look at the condition of the abrasive cutting disc fitted onto the saw, whomever had previously used the saw had severely damaged the cutting disc, it had a large piece missing from the cutting edge that became a slot in the disc running for approximately 90mm around the disc and 20mm in from the cutting edge, whoever damaged the disc should have at the very least removed it from the saw, if used in this condition chances are it would have burst and possibly cause injury to the operator.	
Breakdown agency: Powered tools appliances & equipment None	
Witnessed by: L. Tankard	

Recommendation and Actions	
Immediate causes: Haste, lack of attention, disregard for safety	
Immediate actions to prevent recurrence : The disc was removed and replaced with a new one

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie DeLaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Missing passenger	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams):	
<p>During todays crew change, a passenger who was scheduled to fly missed his flight. The helicopter was contacted and it returned to collect him.</p> <p>It seems as though the passenger was confused as to which helicopter was on deck and which helicopter he should have been on , despite the posting of the passenger lists and being told verbally.</p> <p>There were several factors which allowed this to occur;</p> <p>The manifests were changed close to the flight times due to the possibility of a 2 day crew change.</p> <p>The vessel was only given 8 minutes notice of the helicopters arrival by Esso heliops.</p> <p>The flights were very close together.</p>	
Breakdown agency: Other & unspecified None	
Witnessed by: Dave Danyluk, Howie Grizaard	

Recommendation and Actions									
Immediate causes: The pilot and Helimarshal failed to properly check the passenger head count against the manifest.									
Immediate actions to prevent recurrence : Helimarshal to check passengers to the printed manifest and to notify the bridge if any passengers are missing

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Greater Bream 3D 2006
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: 2x fluorescent tubes in paper bin	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): Upon opening the wheely bin located at the bottom of the stair way by the wash basin in the locker area I observed the ends of 2x 600mm fluorescent light tubes discarded in the bin provided for the disposal of paper hand towel.	
Breakdown agency: Materials & substances None	
Witnessed by: L. Tankard	

Recommendation and Actions			
Immediate causes: There is a specified bin for the disposal of fluorescent tubes within 15m of the paper bin, whomever placed the tubes in the paper bin was either unaware of this or chose to use the incorrect bin even though the lid that must be lifted is clearly labelled paper and cardboard only.			
Immediate actions to prevent recurrence : Removed the tubes and placed them in the correct bin

Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Bream 3D
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Loose umbilical bobbin.	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams):	
During rough weather a ratchet strap used for securing a wooden bobbin containing a umbilical broke free . The bobbin rolled across the deck and crushed the foam pump remote switching control box and smashed fire hose box #8.	
To prevent further movement the bobbin was wedged with wooden blocks and further secured using chains and load binder .	
 MVC-679F.JPG	
Breakdown agency: Environmental agencies None	
Witnessed by: Neil Collinge, Manny Ollada.	

Recommendation and Actions			
Immediate causes: Ratchet strap breaking.			
Immediate actions to prevent recurrence : Bobbin chained down.

Incident Report - Hazard
Veritas Viking2
-- Closed --**

V2-IR-06-PMVV6P73MR

Job information (Job Information is auto-filled if a DCS Daily if found matching the Date of Incident)	
Job number: 20323	Client name: Esso Australia Pty Ltd
Supervisor: Jackie Delaughter	Job name: Bream 3D
Area of operation: Gippsland Basin, offshore Australia	

Event Description	
Brief description: Securing brackets exposed	
Describe in detail how the event occurred (attach any relevant documents / images / diagrams): During Tropical Cyclone Hubert the Swimming Pool on the fore peek collapsed. The Pool was damaged beyond repair and was removed while in Fremantle. Once the Pool was removed the securing brackets were exposed causing a trip hazard.	
Breakdown agency: Machinery & mainly fixed equipment (plant) None	
Witnessed by: Morgan McNelly, Helmik Saevik and Dave Danyluk	

Recommendation and Actions	
Immediate causes: Haste/no follow through by crew members	
Immediate actions to prevent recurrence : Short Term = Barricade the area to restrict traffic. Long Term = Brackets to be ground off at earliest opportunity	
AIM categories:	Conditions & Housekeeping (work area)/Work areas free of slip & trip hazards
AIM behaviors:	Conditions & Housekeeping (work area)/Signs & barricading

TapRoot:

Category	Base Cause	Near Root Cause	Root Cause
1			

Corrective action plan / request: Area clean-up

Followup
Follow-up by whom: Captain, Party Manager, Bosun
Date corrective action taken : Apr/25/2006

General Incident Information	
Date of report: Apr/25/2006	Date of incident: Apr/22/2006
Report completed by: PM Veritas-Viking2	Local time of incident: 09:22 AM
Incident identified by: Veritas	Document author: PM Veritas-Viking2
Activity at time of incident: Transit None None	Where observed: Open deck
Potential outcome: Low/Acceptable Risk	Recurrence potential: Low

Environmental Conditions				Environment Sea State

1.0 Operation Descriptions & Listings

1.1 Introduction

This Safety Case document is prepared for and by the crew of the geophysical survey vessel Veritas Viking II and is approved by the Management of Veritas Marine Acquisition. It contains information on the management structure and responsibilities of Veritas Marine Acquisition, procedures and instructions for emergencies, safety critical procedures for general offshore activities and geophysical operations and a register of possible hazards that would be encountered during normal operations. This document also contains a Bridging Document between Veritas and Eidesvik the vessel owners and operators, of Bergen, Norway.

A supplement to this document, the Project Specific HSE Plan, is prepared for each new project and will detail local conditions, area obstructions or additional hazards, communication procedures and available support resources. Additional equipment or procedures will be detailed in this document.

All employees and management are responsible to act according to the company safety systems, with a view to safe and successful operations and quality assurance, however should international conventions, codes, rules or regulations differ, then this document and the systems and procedures contained within shall yield place. This would also be the case with Eidesvik Shipping or the Master of the vessel, if in their opinion a threat was posed to the safe operation of the ship.

1.2 Vessel Description

The Veritas Viking II is a purpose built, multi element seismic research vessel, rigged to acquire multiple lines of 3-D marine seismic data. The vessel is owned by Eidesvik & Co. AS and on long-term charter to Veritas Marine Acquisition, and crewed by marine personnel in the employ of the vessel owners.

The vessel is equipped with advanced integrated geophysical and navigation data acquisition systems, full quality assurance capabilities and onboard navigation and seismic data processing.

The vessel, travels along predetermined seismic lines, towing as many as 8 streamers up to 8,000m in length, and also deploys and tows various arrays of high pressure Air Guns used to generate the seismic pulse. The energy generated by the Air Guns is reflected from the sub-surface strata and the data is gathered through the Hydrophone groups, which are spaced equidistantly along the entire length of each towed streamer, and systematically transmitted to the recording systems onboard the vessel.

Vessel

Name : SR/V Veritas Viking II
Owner : Eidesvik A/S
Port of Registry : Haugesund, Norway
Date Built : May 1999
Official Number : 9189512
Call Sign : LMIE

Classifications

Flag : Norway
Class: : DNV +A1 SF EO HELDK.DK +S BM

Dimensions

Length : 93.35 meters
Beam : 22.00 meters
Draft : 7.05 meters
GRT : 7,764 tons (gross registered tonnage)
NRT : 2,329 tons (net registered tonnage)

Machinery

Main Engines : 2 x MAK 9m 32
Main Drive Power : 2 x 4320 Kw (2 x 5832 bhp)
Bow Thruster : 1 x KaMaWa 1200 Kw Azimuth Thruster
1 x Brunvoll 1200 Kw Tunnel Thruster
Stern Thruster : 1 Brunvoll 736 Kw Tunnel Thruster
Generators : 2 x AVK DSG 114K1-6W Shaft Generators
2 x 2950 KVA, 3 x 440 Volt, 60 Hz
Rated 360 KW
2 x 2950 KVA, 3 x 440 Volt, 60 Hz
Auxilliary-1 Mitsubishi S6R-MPTA-525kW
Emergency -1 Mitsubishi S6B3-MPTK
Pitch : 2 x Variable

Capacities

Fuel Oil Capacity : 2,040 cubic meters
Fresh Water Capacity : 421 cubic meters
Water Maker : 33 cubic meters/day
Cruising Speed : 14 knots
Range : 18,960NM @ 10 knots
Endurance : 79 days

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05

Electronics

Radar	:	2 ARPA Furono FAR-28355/FAR-28255
Standard Compass	:	Bergen Nautic, Model # BN35PL
Gyro Compass	:	2x Sg Brown Meridion
Depth Sounder	:	Skipper GDS 101, 38 kHz
Communication	:	GMDSS Class, Satcon "B"

Extras

Radio Direction Finder	:	Tayio TD-L1550A
Helideck	:	Up to AS232L Super Puma
Hospital	:	1 with 2 beds

1.3 Safety Equipment

Lifeboats	:	1 x Schat Harding, 60 person, enclosed, self righting fiber glass lifeboat, secured on gravity davit, situated at mid-ship on the starboard side of the vessel. The engine is an electric start 29 hp diesel engine. Launching of the boat and releasing from hook can be operated from inside the craft. The boat is fitted with inventory in accordance with the Norwegian Ships Control Rules and also according to IMO rules. A sprinkler system and Emergency air system are fitted to protect the lifeboat and it's occupants from fire on the sea surface or from hazardous gasses.
Liferafts	:	4 x 20 and 4 x 25 persons inflatable rafts and 1 man-overboard liferaft with a capacity of 6 persons. The rafts can be either manually launched or launched with the crane davits, they are also fitted with automatic hydrostatic release gear.
Rescue Craft	:	1 x Norsafe Magnum 750, 7.50m Fast Rescue Craft, situated on the port side, aft of the stack. The engine is a Yanmar 200 hp diesel, with a Hamilton Waterjet type propulsion unit giving a speed of 26 knots. The boat is launched via a GMC Knuckleboom type crane.
Lifejackets/Belts	:	120 x Sunmore Livbeltefabrikk. 65 jackets are located in containers on the Boat Deck; the remainder are distributed amongst the berths around the vessel. Sospender type, self-inflating Work Vests are located at various positions for exposed deck and FRC operations.
Survival Suits	:	62 x Hely Hansen Survival suits ,60 on the boat deck (muster station) and 2 on the bridge.
Survival Work Suits	:	8x Helly Hansen , 7x Typhoon work suits , in warm climates these are stored away , in colder climates these can be found by the FRC changing area (outside dirty mess).
Lifebuoys	:	14 x Ring Buoys, (with smoke float and signal light).
Smoke Floats	:	6x Smoke floats located 2 on the bridge wings , 2 on acc.deck 03 and 2 on the 1st deck.
Line Throwing	:	1 Kit (4 Rockets & 4 lines).

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Operations Description & Listing.		Page 7 of 182

- Distress Signals** : 12
- Radio Safety Equipment** : This vessel is equipped with a GMDSS radio station.
2 x Tron-Sart-Jotron Radar Transponders 9GHz.
3 X Portable VHF Radio.
5 x Portable UHF Radio.
1 x Tron, type 30S Class 2, 406 MHz
- Foam Systems** : The following areas are protected by Foam Fire Fighting System:
Helideck Port & Starboard.
Main & Spare Streamer Reels
- CO2 System** : The following areas are protected by CO2 Fire Fighting System:
Engine Room Galley Seismic Chemical Store
Compressor Room Bow Thruster Room
Cable repair store /cable store Incinerator Room
- Fire Extinguishers** : Portable Fire Extinguishers are located at various areas around the ship. The ship's Fire & Safety Plan detail the location and type.
- Fireman's Equipment** : 3x Firemans lockers , one top stbd side top deck (by lifeboat)
one fore castle storage area acc. deck 02, one outside the rigging store by the steps that lead up to the crane deck
Flashlight
Breathing Apparatus (with 3 spare bottles)
Set of Protective Clothing
Two Pairs of Boots
Fireman's Helmet
Axe and Belt Holster
Lifeline
A high pressure air compressor is installed in the in the fire store (which is situated in front of the muster station stbd side). In addition we have 2 BA sets in the Emergency Helicopter room.
Total onboard: 8 x BA sets and 8 spare bottles
- Fire Axes** : There are 4 axes in the corridors ,in addition there are 6 axes in the smoke divers lockers ,as well as the axes in the Emergency helicopter room -see inventory below
- Fire Hoses & Hydrants** : 38 x Fire Hydrants each with 15m hoses. Each hose is stored in labeled containers with hose nozzles and quick connectors.
- Fire Pumps** : 3 x Allweiler
Capacity - 35,000 gal/hr.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Operations Description & Listing.		Page 8 of 182

The pumps can be remotely operated from the Bridge, Engine Control Room, Fire Fighting Stations Streamer Deck & Gun Deck.

Fire Detection System : The vessel is equipped with a heat and smoke detection system. Detectors are installed in all Cabins, Dayrooms, Corridors, Engine Room and all Store compartments. All detectors and manual Alarm Buttons are connected to a central control panel located on the Bridge. The alarm system is audible through the alarm bell system.

Helideck Rescue Equip. : 1 x complete kit, contained in locker forward of helideck

Helicopter Emergency Equip.

Oxygen Set : 1 x Unitor, located on Accommodation deck 5B.

Emergency Generator : 1 x 450 KVA Generator.

The Generator automatically starts upon failure of the main electrical power, and supplies 440, 220 & 110 V AC. This generator powers and recharges the emergency lights, the Engine Room and Emergency Controls and navigation Systems.

Medical Locker : There are various First-Aid kits, which are stocked with supplies from the ship's Hospital. These kits are located in the Galley, Recording Room, Gunshack and Engine Room. In addition there are 2 first aid kits on the bridge, one of these contains a defibrillator and oxygen

Watertight Doors : 4

1.4 Vessel Orientation

Upon Arrival

Upon arrival at any Veritas Marine Acquisition operated vessel, the ship's Chief Officer or Operations Supervisor will give new personnel a brief induction. This will include showing them their cabin, the emergency muster station, life raft locations, as well as any extra duties they may have to perform. These could include extra responsibilities during man overboard drills and helicopter transfers. A comprehensive tour of the vessel and all safety systems will be given within the first 24 hours of joining the vessel.

This vessel carries a large complement of both marine and seismic crew, along with various guests and support personnel; therefore most of the cabins will be occupied.

There will be a life jacket stored at each berth onboard. All personnel are required to familiarize themselves with this equipment at the earliest opportunity. Each person should ensure the life jacket has an emergency light and whistle. In the event that these items are needed each person should be able to use them confidently. An actual emergency is not the situation that personnel should want to try them on for the first time. All personnel will be assigned a life raft during an actual emergency. There is one life boat situated on the starboard side for all personnel. Any missing or defective items are to be reported to the First Officer immediately.

All personnel should take time to learn all possible escape routes from their berth and their work area. At least two different ways of escape to the Muster Station should be identified from each area.

Each person should make time to get to know the ship. Emergency situations can be confused, with less than ideal conditions. There could be smoke, fire, darkness, heavy seas, etc., so ease of

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Operations Description & Listing.		Page 9 of 182

escape is enhanced by thorough knowledge of all exits. In the event of an emergency, all personnel, no matter where they sleep or work, should have the knowledge and confidence to proceed to their Muster Station by the safest and quickest route. Each cabin has a framed notice showing the location of your cabin on the vessel, and the quickest escape route.

Safety Hints

A ship is unlike a work place on land, in that this work place can be fairly unpredictable when it comes to stability. All personnel must ensure that their belongings are properly stowed **BEFORE** the ship sails, and not wait for rough weather to secure their gear. All personnel should review their work area before leaving port. Take special note that heavy items that are not secured can move about dangerously in heavy seas.

Personnel are required to advise fellow workers where they are going to be located when working by themselves, a requirement known as the "buddy system", especially important during heavy weather

A permit system is in operation on all Veritas Marine Acquisition vessels. This system covers hot work (cutting or welding), electrical repairs, heavy lift with a crane or hoist, FRC launchings, entry to an enclosed space, and working aloft. The purpose of the permit system is to ensure all hazards have been identified and controls are in place to minimize risk and that all safeguards are adhered to. It is a requirement for all personnel to use these permits as they make the task safer for you and others.

Personal Protective Equipment (PPE) is available to all personnel. Basic PPE, i.e. Steel Toe Boots, Hard Hat, Coveralls, Hearing Protection and Gloves will be issued to personnel where appropriate. Additional or replacement PPE should be sought from the Chief Officer or Operations Supervisor. There are a number of areas on these vessels where it is mandatory to wear certain safety items.

STREAMER DECK : Steel toed footwear, hard hat. Work vest if servicing blocks at the stern. Eye protection.

GUN DECK : Steel toed footwear, hard hat, ear protection, workvest, and lifebelt connected to the safety line, if working aft of the marked area on the deck. Eye protection.

CRANE DECK : Steel toed footwear and hard hat.

All personnel are required to take exceptional care of all safety equipment used, as it could one day save a life. Report any defects to the Chief Officer or Operations Supervisor immediately.

Housekeeping is particularly important on any vessel. All personnel are required to leave their work area clean and clear. This includes putting away tools and cleaning up any grease or oil spills. Of equal importance are the recreational areas used while Off-Shift.

Any ship makes unpredictable movements, therefore an important rule for all to remember: -

"ONE HAND FOR YOU, ONE HAND FOR THE SHIP"

Always use the handrails while using the stairways.

All personnel should be familiar with the fire fighting appliances around the ship. Regular and varied drills are conducted to show personnel of the various operating techniques. The first response to any fire incident is to raise the alarm, before any attempt is made to extinguish the fire.

Shipboard Emergencies and Signals

There are three important emergency signals that could be sounded on these vessels, of which all personnel should be aware, and able to respond.

Note that these can be "rings" on the ships bell, or "blasts" on the ships whistle.

INTERMITTENT RINGING

FIRE / EMERGENCY

CONTINUOUS RINGING, 7 SHORT RINGS, 1 LONG RING

ABANDON SHIP

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Operations Description & Listing.		Page 10 of 182

CONTINUOUS RINGING

MAN OVERBOARD

(3 Short Rings indicates dismissal from emergency stations.)

FIRE / EMERGENCY

Upon hearing the fire/emergency alarm, all personnel are required to don a life jacket, and proceed directly to the muster point. Life jackets are located in each cabin, and in float free lockers at the Muster Point. Survival Suits if located at your work area or cabin, should also be carried to the Muster Point. The vessel carries a sufficient number of life jackets in the lockers at the Muster Point for all personnel, it is preferred that personnel proceed directly to the Muster Point for the life jackets instead of their cabins.

NO PERSONAL ITEMS SHOULD BE BROUGHT TO THE MUSTER POINT AND ALL PERSONNEL ARE REQUIRED TO REMAIN THERE UNTIL THE ALL CLEAR HAS BEEN GIVEN.

Personnel assigned to an attack/response team, should report to their attack/response team duties, life jackets are available at the muster point for these personnel. Clothes recommended for wearing to the muster station are long sleeves and long pants, shoes or boots (no open shoes) and a hat. These should also be worn to drills. A Survival Suit is applicable to all regions of low ambient water temperature, but recommended for use during any abandonment. Survival suits will be issued at the Muster point.

ABANDON SHIP

Upon hearing the abandon ship signal, all personnel should don a life jacket and proceed calmly and directly to the Muster Point, and await further instructions. Be familiar with your Survival Suit, and be ready use it when instructed.

When the order is given to abandon the ship, the Life Boat, FRC's and all rafts will be launched by the marine crew, all personnel should give assistance where required. Follow the instructions of the lifeboat or life raft commander. Remain calm and if possible, dry. UNDER NO CIRCUMSTANCES ARE YOU TO JUMP ON TOP OF LIFE RAFTS.

Lifejackets

When responding to an emergency alarm, proceed directly to the Muster Point, where you will be issued a Lifejacket, equipped with a light, whistle and retro-reflective tape.

The Lifejackets on the Viking can only be worn one way. Ensure your arms pass through the loops at each shoulder, snap strap into buckle at side and tighten strap. The Lifejacket is designed to give you a stable floating position with face up and body inclined backwards. A loose Lifejacket will become very uncomfortable in the water, and it will be difficult to adjust when wet. Instructions for donning your Lifejacket are posted around the ship, and this should be practiced regularly

In the event that you have to jump from the ship into the sea, try to get as close to the water as possible. Jump in, feet first, with you legs and body straight. Press your elbows to your sides, cross your arms at your chest, and hold the top edges of you jacket firmly, this will stop the Lifejacket from loosening when you enter the water. Swimming with a Lifejacket is best performed using backstroke.

Survival Suits

When responding to an emergency alarm, proceed directly to the Muster Point, where you will be issued a Survival Suit.

Put on the suit as you would a pair of coveralls. The suit is insulated, but the use of warm clothing underneath will increase survival time. Put the hood over you head and try to expel all the air from the suit as you close the zipper. If you jump into the sea, the air in the suit will be pressed out

Title: Operations Description & Listing.		Page 11 of 182

through the face lining and water may enter the suit. Therefore it is important to press as much air out of the suit prior to entering the water, as well as ensuring the chin flap is tight. If the face lining feels uncomfortably tight, it is a consolation to know that this is necessary to ensure water tightness.

If the suit becomes damaged or swamped, it will still render protection as a wet suit. It may however be virtually impossible to enter a survival craft with a water-filled suit, even if assisted. In this instance try to remove the suit, or cut it in a way to allow water to drain from the legs.

The suit will float a person on their back and swimming is best performed by using a backstroke. The suit will be equipped with a light, whistle and retro-reflective tape, and a lifting strap at the front to facilitate retrieval.

MAN OVERBOARD (MOB)

There are set tasks to follow in the event of a Man Overboard (MOB). These are as follows:

- 1) Inform the bridge so that the position can be marked and the guns stopped,
- 2) Do not lose visual contact with them, **as their life depends on it,**
- 3) Throw them as many flotation devices as you can, including the MOB Raft.

FRC crew will launch the rescue craft while all other personnel proceed to the muster station, maintain lookout and await instructions. Chase Boat and other vessels in the vicinity will be advised to maintain a lookout and assist where necessary.

SHIPBOARD ROUTINES

Emergency Drills will be held once a week to increase the preparedness and skills of the ships emergency teams. These drills should be varied and not looked upon as an inconvenience as something new can be learnt each week. All persons should show enthusiasm and ask questions whenever possible. A well-drilled crew could mean the difference between saving the vessel, or sitting in a crowded life raft awaiting rescue.

The day and time of all drills will normally be posted in advance, but are usually held on Sundays, weather and operations permitting, alternating between late mornings and early afternoons, from week to week.

New personnel are required to fill out a brief medical history to aid in organizing treatment, for illness or accident causing serious injury. All personnel are required to inform the Captain or Medic (if onboard) of any prescription medication in use when joining the vessel.

Medical supplies for minor ailments will be available, located in cabinets throughout the ship. Additional or prescription medicines should be requisitioned from the Master and/or Medic where required.

An accident causing injury, no matter how slight, should always be reported to the Master, Party Manager and Operations Supervisor. This will allow the injury to be treated correctly and, if there are complications (infections etc.), the reports will aid personnel performing further treatment.

Veritas Marine Acquisition has a "Near Miss" reporting system in place. If an incident occurs that could have caused injury, it should be reported through this system. This will alert the rest of the crew to the potential danger of a certain area or task, until the situation can be rectified. Personnel are encouraged to complete these forms, as they help make the vessel a safer place to work.

There are washing machines and dryers on the vessel, with washing powder provided. You are expected to do your own laundry, making sure you leave the area clean when you leave. Please remove your laundry from the machines promptly so that others can use them. The ship provides bed linen and towels, and these should be changed once a week.

Each cabin has a separate bathroom. It is required that you keep your cabin and bathroom neat and tidy at all times.

Title: Operations Description & Listing.		Page 12 of 182

Meal Times

Meals are normally served in the mess between at the following times:

Breakfast:	0530 - 0630
Lunch	1130 - 1230
Dinner	1730 - 1830

All personnel are required to wear shirts and appropriate footwear during meals; work clothes and boots are not permitted in these areas. There are no special seating arrangements. After finishing your meal, take your plate and cutlery to the galley to be washed.

Recreation areas are provided on this vessel for your comfort and convenience. Work clothes and boots are not permitted in these areas. TV's and VCR's are located in the recreation areas and available for all personnel to use, but treat everything with respect and note that dirty work clothes and boots are not permitted in these areas. Please leave all recreation areas clean and tidy.

When viewing videos brought onboard by individuals, due consideration is to be given to ensuring the material shown does not give offense to anyone present. Similar care is to be taken with "artistic material" displayed in public areas.

This is a 24-hour operation so at any given time there are as many people sleeping as there are working. For this reason, all personnel are to be considerate of others and be quiet when moving around the passageways.

ABSOLUTELY NO ALCOHOL, UNPRESCRIBED DRUGS OR FIREARMS ARE PERMITTED ON THIS VESSEL.

Depending on the severity of the offense, termination can result.

Certain areas are designated NON SMOKING. All personnel should be familiar with these areas, and under no circumstances is smoking permitted in any area designated as such.

Title: Policy.		Page 14 of 182

2.0 Policy

2.1 Introduction to Policies

The policies contained herein have been developed to provide clear guidance in the application of the safety policies and standards of Veritas Marine Acquisition, our clients, and various authorities who have jurisdiction over areas of our operation.

All Veritas Marine Acquisition employees, contractors, sub-contractors and representatives of other organizations are reminded that they are required to fully adhere to all of Veritas Marine Acquisition's policies while engaged on the Veritas Viking II.

Veritas Marine Acquisition prohibits the possession or use of alcohol, drugs or controlled substances that affect job performance. Random testing of all personnel can be carried out, at any time, without notice. Veritas Marine Acquisition is committed to preventing the use and/or presence of these substances in the workplace and failure to adhere to the company's policies on alcohol or substance abuse will result in disciplinary action up to and including termination of employment.

Various areas on the vessel are designated as "Non-Smoking" areas for safety reasons, due to combustible substances contained within these areas. Designated smoking areas are available to all personnel.

All Veritas DGC policies are available in various languages and are available electronically as such throughout the Veritas Integrity Management System (VIMS). For the purpose of this document all such policies will be displayed in English.

2.2 Health, Safety & Environmental Policy Statement

Veritas DGC is committed to achieving and maintaining excellence in all aspects of its operations. Veritas DGC recognizes and accepts the mandate to conduct its activities in a responsible manner. Veritas DGC will, so far as it is reasonably practicable, provide a system of work that protects the health and safety of its own employees, visitors, contractors and the public and at the same time minimizes the impact of its activities on the environment. Veritas DGC recognizes that all injuries are preventable.

The accountability for achieving these objectives is vested in the appropriate level of Operating Manager. To achieve excellence in our business and work environment, the commitment and cooperation of all management, staff, contractors and visitors is essential.

In order to support this policy Veritas DGC will:

- Develop, implement and maintain the Veritas Integrity Management System (VIMS);
- Promote and maintain high awareness of workplace hazards, the risks associated with them and the techniques to render risks as low as reasonably practicable;
- Encourage the development, implementation and use of industry best practice;
- Ensure that employees are competent to conduct their specified tasks;
- Specify proactive Key Performance Indicators, set objectives, regularly review performance and recognize excellence;
- Maintain an incident reporting system that allows analysis of losses or potential losses and facilitates dissemination of the recommendations to prevent recurrence across the Company;
- Conduct regular audits and inspections of company, and where applicable, contractor facilities;
- Conduct its business operations to ensure minimal impact on the environment through prevention and conservation and by continuously improving best practices. This can be achieved in part by firstly reducing, reusing and recycling then by treating and disposing of waste in an environmentally friendly manner;
- Demonstrate continuous improvement.

All employees and contractors for their part will be required to:

- Comply with or exceed relevant standards specified by statute, industry or the Veritas Integrity Management System (VIMS);
- Contribute to the planning process, actively participate in assisting the company in achieving its stated goals and targets;
- Actively participate in the reporting and subsequent investigation of all accidents, incidents, hazards and near misses that have the potential to impact on Veritas DGC operations;
- Proactively propose innovative processes or methods to further minimize risk and communicate these methods as appropriate;
- Accept responsibility for protecting themselves, visitors and members of the public who may be affected by their activities;
- Maintain a consistently high level of environment impact awareness and to conduct themselves in a manner which ensures their actions have a negligible impact on the environment.

Thierry PILENKO
Chief Executive Officer

Tim WELLS
President & Chief Operating Officer

Title: Policy.		Page 16 of 182

2.3 Environmental Protection Policy Statement

Veritas accepts the responsibility to operate its businesses in such a way as to eliminate or minimize the impact of its activities on the environment. This responsibility extends beyond conformance to local laws and regulations and includes striving to achieve best practice in environmental protection performance. This policy and these responsibilities apply to all Veritas personnel, in all operations, regardless of jurisdiction or remoteness.

To meet this responsibility, Veritas will:

- Eliminate or minimize the impact of our operations on the environment through prevention and conservation and by continually improving our best practices;
- Adopt the practices of reduction, reuse and recycling;
- Treat and dispose of waste generated by our activities in an environmentally acceptable manner;
- Prevent, reduce or control pollution, through management of our activities so as to minimize adverse impacts on the environment;
- Respect the rights of indigenous peoples in areas where we may be working;
- Respect and safeguard the integrity of archaeological sites which may be encountered;
- Comply with recommended conservation practices when working in environmentally sensitive zones or where endangered species are present;
- Monitor compliance with applicable local statutes and internal standards and procedures through periodic reviews and external audits;
- Conduct Environmental Impact Assessments as applicable;
- Report and monitor our environmental impact performance, set targets for improvement and demonstrate compliance in achieving these targets;
- Continuously improve our environmental impact performance and demonstrate compliance with the Veritas Integrity Management System (VIMS) and ISO 14001.

Individuals for their part will:

- Maintain high levels of awareness related to the effect of their activities on the environment and continually strive to minimize these effects;
- Report environmental incidents, sightings of protected or designated fauna and encounters with indigenous people (as appropriate) through the VIMS reporting system;
- Proactively discuss environmental issues and suggest and participate in measures to reduce the impact of our activities on the environment.

2.4 Substance Abuse Policy Statement

Veritas DGC is committed to maintaining a safe and productive workplace and to promoting an environment that is free from substance abuse. Substance abuse may come about through the use of alcohol and illicit drugs and the inappropriate use of prescription and over-the-counter medicines or any other substance, which may result in impairment to health, behavior, judgement or job performance. Veritas DGC recognizes that substance abuse will impair the ability of employees to perform capably and will have potentially serious adverse effects on the safety, efficiency and productivity of an individual, other employees and the company as a whole.

The responsibility to be fit for work rests with the employee and Veritas DGC recognizes substance dependency as a treatable condition. Employees who suspect they have a substance dependence problem are encouraged to seek advice and appropriate treatment through the Veritas DGC Employee Assistance Program (EAP). Being unfit for work because of substance abuse is grounds for action up to and including termination of employment. This policy is intended to apply to all forms of misuse of substances affecting the central nervous system, including alcohol, legal and illegal drugs. Veritas DGC prohibits the unlawful manufacture, distribution, dispensation, presence or use of, alcohol, drugs or other controlled substances on its property or worksites, and is committed to instituting and maintaining a drug free workplace, to this end Veritas DGC will:

- Provide clear guidelines and consistent procedures for the use of alcohol or other substances:
- Provide substance abuse prevention education and supervisory training:
- Subject employees to a drug testing program (where local statutes support such an action) to help administer this policy and to ensure that all employees conform to state, federal and international regulations and laws:
- Subject employees violating this prohibition to discipline up to and including termination:
- Offer assistance to employees and family members in resolving problems related to substance abuse:

Veritas DGC recognizes that drug and alcohol issues can be sensitive and will undertake to assist employees through the provision of confidential and expert counseling / assistance services and further:

- No employee with alcohol or drug dependency will be terminated due to the request for help in overcoming their dependency or because of involvement in rehabilitation:
- An employee who has a substance abuse problem will not be permitted to work in designated positions identified by management as being critical to the safety and well being of employees, contractors, the public or Veritas DGC:
- Any employee returning from rehabilitation will be required to participate in a Veritas DGC approved after-care program.

2.5 Alcohol Policy

General

Consuming or being under the influence of alcoholic beverages while on Company business on Company premises, in a Company vehicle or while on the job site of a client, is prohibited.

Marine Crews

A zero-tolerance alcohol policy will apply to all employees working offshore for a period commencing 12 hours prior to joining a Company vessel, until discharged by vessel management from offshore duties on completion of the work rotation, unless otherwise approved by vessel management.

Failure to adhere to the Company's policy on alcohol will result in disciplinary action up to and including termination of employment.

2.6 Substance Abuse Policy & Procedures

PURPOSE AND APPLICATION

This policy is designed to protect the safety of Veritas DGC employees, clients, sub-contractors, suppliers and the general public. It is not intended to constitute an unwarranted intrusion into the private lives of employees nor is it intended to detect matters unrelated to the safety and efficiency of our workplace. This policy applies to all employees of Veritas DGC and its domestic affiliates.

THIS POLICY AND THE REVISIONS CONTAINED HEREIN SUPERSEDE ANY DRUG TESTING POLICY DATED PRIOR TO JANUARY 2000.

POLICY

The use, possession, transportation, sale, purchase, manufacture or transfer of illegal drugs, controlled substances, or drug paraphernalia by any employee while on company premises or on any job site of a customer is prohibited. The term "company premises" as used in this policy includes all property, facilities, land, buildings, structures, fixtures, equipment, installation, boats, ships, aircraft, vehicles, automobiles, trucks owned, leased or used by the Company, and all other locations where Company business is conducted.

OFF-DUTY DRUG USE

You are expressly forbidden, as a condition of employment, to use unlawful drugs or controlled substances at any time. If a drug screen indicates the unlawful use of drugs by their presence in your system, you will be terminated. If you are convicted of unlawful drug use you will be terminated. You are also prohibited from abusing legitimately prescribed drugs at any time.

SUSPECTED DRUG ABUSE

When an employee is involved in a workplace accident or when there is a reasonable suspicion that an employee is under the influence of a controlled substance while on the job, the Company can require the employee to submit to an alcohol and drug test.

The Employee will be temporarily suspended until the alcohol and drug test results are received.

If the test results are positive the employee will be subject to immediate discharge. If an employee refuses to take the test, the employee will be discharged. If, on the other hand, the test results are negative, the employee will be paid for any wages lost as a result of the temporary suspension.

Reporting to work under the influence of controlled substances is prohibited. The only exception shall be for properly documented prescription drugs, which are being used as prescribed by a licensed physician as medication for the employee. Any employee taking prescription drugs, as prescribed by a licensed physician, that could influence his/her ability to conduct his/her job duties in a safe manner, should advise their supervisor or the Human Resources department.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Policy.		Page 19 of 182

ADHERENCE TO POLICY

Any violation of this policy will lead to disciplinary action, up to and including termination.

RANDOM SEARCH AND TESTING

In order to properly administer and ensure compliance with this policy, the Company reserves the right to request, carry out and/or participate in reasonable searches of employee's personal effects when employees are on duty, on company premises, or on any job site of a customer. Personal effects of employees include, but are not limited to, personal vehicles, purses, wallets, clothing pockets, baggage, toolboxes, lunch pails and briefcases. No search of personal effects will take place unless the employee is first notified and is given the opportunity to be present at the search. Searches by authorized outside personnel under contract to the Company will be conducted in the presence of a Company representative.

Searches of Company owned or controlled property (including, but not limited to, offices, desks, lockers, toolboxes, ships, vehicles, and similar items) may be initiated without prior notice and conducted at times as deemed appropriate by the Company.

Employees will be required without prior notice to submit to a urinalysis drug test at random intervals, at the request of clients, for reasonable cause, as outlined by Federal regulations, and at any other time deemed necessary by the Company.

CONTROLLED SUBSTANCES TESTED FOR

As of the date of this policy, the five drugs tested for include:

- Marijuana (THC Metabolite)
- Cocaine
- Opiates (including heroin)
- Amphetamines
- Phencyclidine (PCP)

The detection "cut off levels" for the controlled substances subject to drug screening are those set forth in 40 C.F.R. § 40.29 (e) for initial immunoassay screening and in 29 C.F.R. § 40.29(f) for confirmatory GC/MS testing.

TESTING PROCEDURES

A split urine sample is taken from an employee and analyzed for the presence of marijuana (THC Metabolite), cocaine, opiates, phencyclidine, and amphetamines. Any trace above the threshold limit is considered a positive result. If an employee's initial urinalysis test is positive for the presence of controlled substances, a Gas Chromatography/Mass Spectrometry (GC/MS) confirmation test of the original specimen will be performed to confirm the results.

An independent medical facility, certified for drug and alcohol testing by the U.S. Department of Health and Human Services will conduct the tests, analyzes the results, and counsels employees regarding the outcome of the test(s). Further, the medical facility's Medical Review Officer (MRO) must be certified as a substance abuse professional. The Company will rely on the independent medical facility/MRO to provide appropriate documented data and testimony if the test results in an adverse personnel action or a grievance.

REPORTING PROCEDURES

If the confirming GC/MS test reflects that controlled substances are present in the employee's sample in a detectable amount, the medical facility's Medical Review Officer (MRO) shall contact the employee tested and explore with him/her possible causes for the presence of those substances. If the MRO determines, after such discussion, that no alcohol or drug use has occurred which violates this policy, no further action will be taken.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Policy.		Page 20 of 182

If, however, the MRO determines that the explanation is not satisfactory, he/she will notify the Company and thereafter the following will occur:

1. Any conditional offer of employment made to an applicant shall be withdrawn and such person shall not be considered any further for employment with the Company.
2. Employees whose GC/MS test reflects that illegal or illicitly used substances are present in a detectable amount will be immediately terminated.
3. Persons subject to testing who are in the employment of an independent contractor providing services to the Company will not be permitted to remain on or to enter the premises of the Company or to perform work on the contract between the Company and the independent contractor. The independent contractor will be asked to reassign its employee to some other project in which the Company is not involved.

DISCIPLINARY ACTION

Discovery of Prohibited Articles

If, during any search, articles or substances prohibited by this policy are found, any employee in possession of such articles or substances will be subject to immediate termination without eligibility for rehire.

Sale or Transfer of Prohibited Articles

Any employee involved in the sale or transfer of prohibited articles or substances will be subject to immediate termination without eligibility for rehire.

Refusal of Consent

Drug testing and searches as outlined in this policy are terms and conditions of employment. Refusing to consent to either testing or searches will be subject to immediate termination.

Sample Alteration

Any employee who tampers, substitutes, or alters any urine sample will be subject to immediate termination without eligibility for rehire.

Positive Test Results

Any employee whose GC/MS test results are positive for illegal or illicitly used substances will be subject to immediate termination.

ELIGIBILITY FOR REHIRE

An employee who terminates for refusal of consent or positive test results will be eligible for rehire only if the following conditions are met:

1. The employee must notify the Human Resources Manager that he/she wants to be considered for rehire. This request must be written and received in the Human Resources Offices within ten (10) calendar days after the date of discharge.
2. One Company paid drug test will be administered in Houston. All other expenses will be the responsibility of the terminated employee, including travel expenses. The drug test must be administered under the same terms and conditions of drug tests given current employees.
3. The drug test must be administered within thirty (30) calendar days of the termination date. The terminated employee and the Human Resources Manager will mutually decide the date.
4. The drug test must result in a negative report, proof of which will be contained in the terminated employee's drug testing file.
5. The terminated employee will then be eligible for rehire.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Policy.		Page 21 of 182

NOTE: ELIGIBILITY FOR REHIRE NEITHER GUARANTEES REHIRE AT ANY TIME FOR ANY POSITION NOR GUARANTEES REINSTATMENT TO POSITION HELD WITH THE COMPANY PRIOR TO DISCHARGE.

REHIRE

An employee who is rehired after termination for refusal of consent or a positive result may be subject to more frequent testing on a random basis for a period of two (2) years. ANY OTHER POSITIVE RESULTS OR REFUSAL OF SUBSEQUENT TESTING WILL RESULT IN IMMEDIATE TERMINATION WITHOUT ELIGIBILITY FOR REHIRE.

In the event that a client insists the Company have a different standard than the one defined in this policy, the Company and its employees will adhere to the standards imposed by the client.

Title: Policy.		Page 22 of 182

2.7 Personal Protective Equipment - PPE

Veritas Marine Acquisition

Personal Protective Equipment (PPE) Policy

Veritas' Marine Acquisition Division prescribes the use of designated Personal Protective Equipment (PPE) in an effort to prevent injuries in our work places. The company encourages all crew members to work in a safe manner and assist fellow crew members in the correct use of PPE. Safe work practices will include the use of PPE by all personnel, including contractors, where prescribed by written procedure and where visual media has been posted.

Training in the correct use and application of PPE is the responsibility of the Department Chief. It is included in the formal indoctrination process for new crew members.

Willful PPE violations are incidents or near misses where crew members deliberately use inadequate or inappropriate PPE in areas, or tasks, where PPE is prescribed. These areas include, but are not restricted to, gun decks, streamer decks, crane decks, helicopter decks, and machinery spaces. Specific tasks such as grinding, burning, working aloft, crane operations, and small boat operations also require prescribed PPE.

The following procedure will be followed for all instances of willful PPE violations:

Incident reports documenting willful violations of prescribed PPE will be submitted via VIMS. The crew member who is in willful violation will be issued with a verbal warning at the time of the incident. Records of verbal warnings will be maintained onboard by the Party Manager in a secure file. Names will not be entered on the report submitted to VIMS.

Persistent willful PPE violations, defined as two reported incidents within a 6 month period, will result in a written warning for submission to Human Resources. Also, the crew member will not be considered for promotion, and will be ineligible for any bonus for a 6 month period following the second violation.

A third willful violation of the prescribed PPE within one year will result in disciplinary action, up to and including termination.

Superior teamwork on our vessels will minimise instances of PPE violations and lead to lower injury rates. Crew members are encouraged to submit Good News Reports in VIMS when assisting fellow crew members in PPE use.

Version 1.0

Approved by C. Richard Price
President, Veritas Marine Acquisition

2.8 Smoke Free Workplace Policy Statement - Marine

SMOKING POLICY - MARINE

The Company recognizes that cigarette smoking represents health and safety hazards and accordingly, the Company strongly encourages personnel not to smoke.

The Company also recognizes, however, that the decision to smoke is a personal one. While the Company does not wish to interfere with that decision, it does want to protect those who have chosen not to smoke.

Therefore, the Company mandates the following controls effective immediately:

- Smoking is only allowed in areas that are specifically designated and clearly marked as smoking areas (includes offices, vessels and any other Company facility). All other areas are non-smoking. There is absolutely no smoking in vessel cabins, common lavatories, elevators, hallways, medical areas, or stairways.

All meetings will be non-smoking events.

Designated smoking areas will be adequately ventilated and will have approved ashtrays and fire fighting equipment.

The Company encourages staff to become non-smokers and may provide reimbursement for reasonable costs for approved smoking cessation aids. Please see your immediate supervisor or Human Resources representative for details.

3.0 Health Safety & Environmental Management System

3.1 Purpose of HSE System

HSE Commitment

Veritas DGC is committed to provide HSE proactive processes to mitigate and eliminate accidents and injuries to persons and damage to the environment, and regards the management of HSE as an integral part of its business activities.

Objectives

Main Objective

The objective of the Veritas VIMS System is to provide processes (tools) to eliminate occupational accidents, injuries, and illnesses. The principles of HSE Management Systems stress the importance of the identification, elimination and correction of hazards and near misses (unsafe acts/conditions) before accidents occur. The following are fundamental to proactive safety processes:

Eliminate - hazards from the work place

Control - hazards that cannot be eliminated

Train - personnel to recognize hazards and implement procedures to avoid accidents.

Prescribe - approved personal protective equipment, control devices or procedures

Additionally, the improvement process incorporates continual review through audits to identify strengths and weaknesses in the safety system. Recommendations are made to improve any identified concerns.

A successful, effective safety program must have strong support, commitment, and involvement from top management. First-line managers have an especially critical role in safety and health protection, as they are immediately responsible for personnel and the work they perform. They have an added advantage of having daily contact with persons and this gives first line managers a greater opportunity to correct unsafe conditions or practices.

Most importantly, we rely on our fellow personnel. It is the commitment and cooperation of this partnership that helps prevent accidents.

3.2 Veritas Integrity Management System (VIMS) – System Description

Veritas has implemented an Integrity Management System called VIMS with an initial focus on Health, Safety and Environment (HSE).

VIMS is based on a model management structure of **Plan–Do–Measure–Review** with the driver being Continuous Improvement. VIMS is a globally networked, structured, hierarchical, electronically distributed and controlled method of sharing Policy, Procedures and Practices cross all operating sites and units within Veritas DGC Inc.

The system uses Lotus Notes® to distribute and update information with VIMS being available on every desk-top and portable personal computer in Veritas. Scheduled replication of databases facilitates the rapid (and document controlled) two way flow of information from corporate and divisional offices to vessels, field crews and office sites—from the field staff to line managers to supervisors, divisional presidents to COO /CEO. Information flow is transparent, two-way and intra-divisional. Users can subscribe to the types and levels of reports that they wish to be notified about and once a report is posted in VIMS, emails are sent to all subscribers. VIMS provides linkages to the web for such applications as Veritas Web Site Employee Advisories, Chemwatch and SOS International. Posting of VIMS/HSE related reports onto the web site also permits customers (through a time expiration password) and other interested parties to access VIMS / HSE information related to a particular project.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 26 of 182

VIMS facilitates statistical analysis and reporting. VIMS can generate a comparison of established Key Performance Indicators (KPI's) by individual sites and also the traditional reactive statistical performance measures such as Lost Time Injury Frequency Rate (**Figure 1**). All users have the ability to generate reports that they wish to see from the system, when they need them.

VIMS describes the organizational; structure, standards, planning, responsibilities, procedures, practices, processes and resources for developing, implementing, achieving reviewing and maintaining the Corporation's Policies.

VIMS is the way that we demonstrate that we do what we say we do.

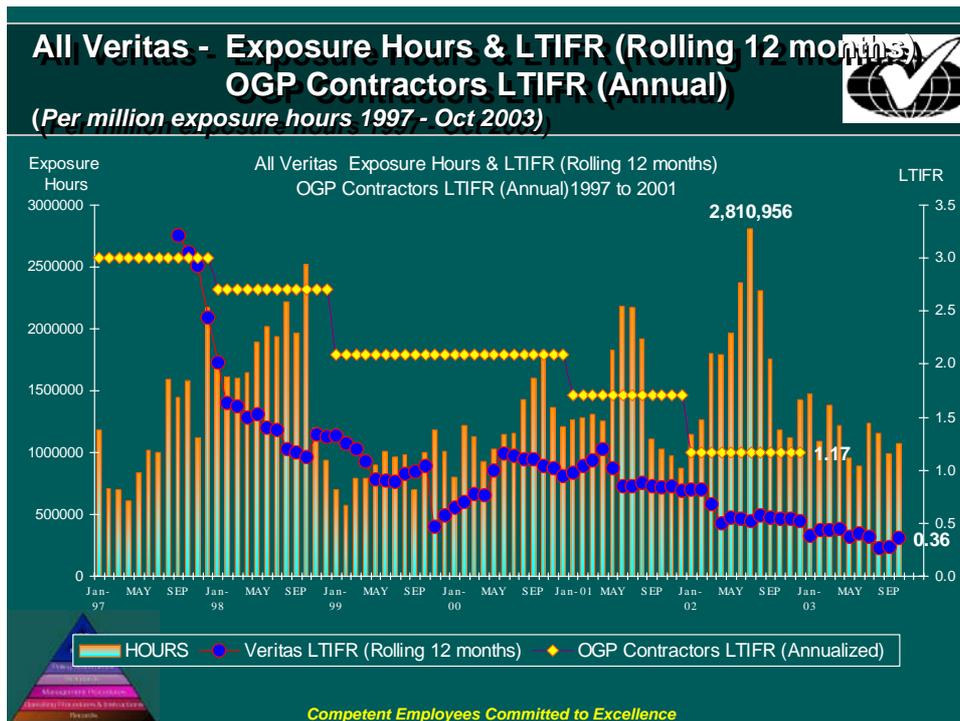

Figure 1 Lost Time Injury Frequency rate

An Overview of Integrity Management

Veritas' approach to Integrity Management is based on thorough identification of hazards and assessment and control of risks through:

- High standards for equipment, engineering and maintenance;
- Comprehensive VIMS procedures and operating instructions (sustained systems of work);
- Accountability for VIMS / HSE performance at the top levels of management;
- Responsibility for VIMS / HSE performance devolved and communicated to operating managers;
- Clear expectations and objectives for operating managers and employees;
- Programs to help employees anticipate potential incidents and to encourage personal action to minimize risks.

This approach effectively combines the awareness to reduce risks arising from the work environment (hardware) with the way activities are performed (behavior).

Veritas has developed a VIMS Vision and Mission, Policy Statements, Standards and management Procedures to provide the foundation required for sustained high standards of performance throughout the Veritas operations and activities world-wide.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 27 of 182

Veritas' strategy for improving performance uses a balanced application of people, procedural measures and facilities to manage the potential risks arising from its business operations (**Figure 2**).

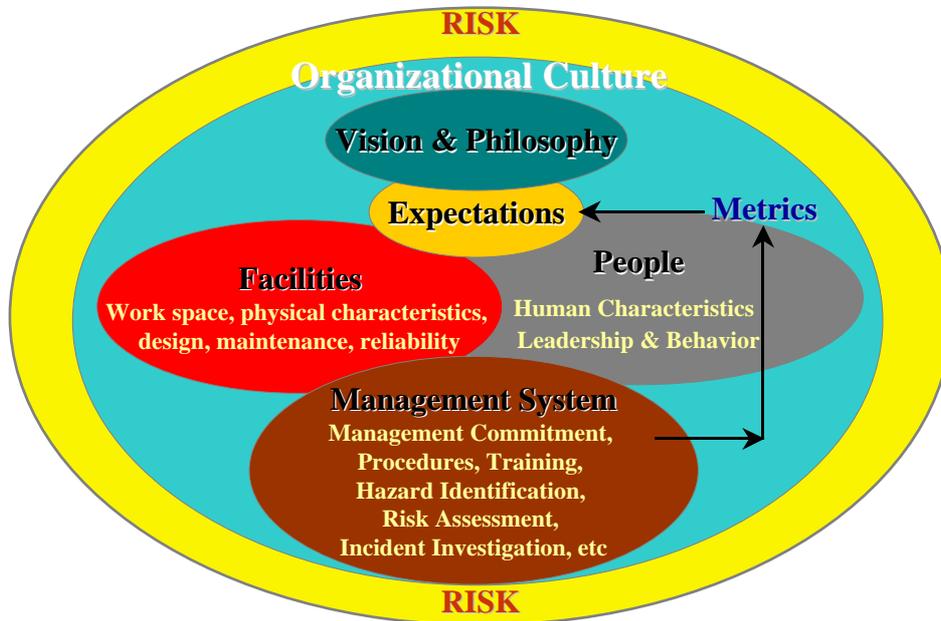

Figure 2 People, Facilities Management System, Expectations and Risk

Integrity Management Organization

Operating Managers are responsible for providing leadership and for development and implementation of VIMS management plans for their areas of responsibility.

Direction and guidance is provided at three levels within Veritas:

Level 1 Corporate Executive Team

Level 2 Division/Product Line General Management Team

Level 3 Site/Business Management Team

The Corporate HSE function provides technical policy support and advice to the Executive Team.

The VIMS Steering Committee provides the medium for communication between the Executive Team, the General Management Team for the various divisions, groups and product lines within Veritas and the Site / Business Management Teams. The VIMS Steering Committee seeks to develop, implement and maintain VIMS, share best practices and propagate the process of continuous improvement.

Activities include:

- Recommending policies and standards to address individual business and corporate VIMS issues;
- Determining strategies for the implementation of policies and standards;
- Providing a mechanism for raising business VIMS /HSE issues;
- Providing a forum for sharing best practices across the divisions / product lines;
- Identifying emerging trends to be reflected in medium and long term planning.

Site and Business Management Teams are supported by site / business based VIMS Committee Representatives who provide representation for site workgroups.

Title: H.S.E. Management System		Page 28 of 182

THE VERITAS INTEGRITY MANAGEMENT SYSTEM

An Overview of VIMS

VIMS comprises a comprehensive set of Standards and Management Procedures which focus, at least initially, on the management of occupational health, safety and environmental issues. The system has been developed and is regularly updated to include requirements from:

- Statutory requirements from various countries in which Veritas operates worldwide;
- Industry best practice;
- Codes of Practice considered to be applicable and relevant to Veritas operations;
- ISO 14001.

The system draws from Veritas worldwide experience in the identification and control of risks. The system is continually being developed to reflect newly identified best practices within Veritas operations, from the ongoing sharing of information with the Veritas divisions and product lines and from benchmarking studies with other industry companies.

Hierarchy of Documents

VIMS provides the basis for a hierarchy of documents which form a comprehensive management process. These documents link together, starting with the expression of a clear vision and mission for VIMS and then describes corporate policies to guide the company's operations.

- Vision & Mission
- Policies
- Standards
- Management Procedures
- Site Operating Procedures
- Records & Reports

The Veritas Vision and Mission, the Policy Statements and the VIMS Standards have been created and reviewed by the VIMS Steering Committee and have been approved with the authority of the Veritas Chairman and Chief Executive and the President and Chief Operating Officer.

The Management Procedures and their key requirements have been developed and reviewed by the VIMS Steering Committee in consultation and approved by the President and Chief Operating Officer.

Vision and Mission

The commitment by Veritas to VIMS/HSE management stems from its Vision and Mission. The company Vision is supported by a VIMS Vision of "Competent Employees Committed to Excellence". The VIMS Mission is:

Veritas DGC, in its processes and activities, is committed to the pursuit of excellence. Excellence will be achieved through the commitment and cooperation of dedicated, responsive and competent employees. The standards, procedures, plans, and responsibilities, goals and targets described in the Veritas Integrity Management System (VIMS) and the contents of the Veritas Health Safety and Environment Policy, define the structures that enables us to conduct our activities to an agreed standard. The Veritas Integrity Management System provides the framework to identify hazards, mitigate risk and audit and review our activities. VIMS processes facilitate continuous improvement and promote ongoing excellence in all aspects of our business.

Title: H.S.E. Management System		Page 29 of 182

Policy and Standards

Policy statements as well as the twenty VIMS standards are available on our website at www.veritasdgc.com.

The standards are listed here:

01. Health and Safety Commitment
02. Management and Resources
03. Risk Management
04. Environmental Management
05. Communication and Consultation
06. Personnel Competency & Training
07. Management of Change
08. Contractors and Suppliers
09. Auditing
10. Performance & Reporting
11. Emergency Plans
12. Systems of Work
13. HSE Assurance
14. Transportation
15. Material Hazards
16. Product Stewardship
17. New Plant, Equipment and Process Design
18. Acquisitions and Divestments
19. Strategic Quality Management (SQM)
20. Security

Management Procedures

Veritas developed the concept of Management Procedures in recognition that individual sites, product lines and divisions may have difficulty maintaining sufficient resources and the necessary expertise to develop and maintain the procedures required to manage the expanding range of risks faced by many organizations. The Management Procedures identify issues relating to each topic and describe practical controls to be applied. Inputs to the Management Procedures come from a variety of sources, some of which are shown in **Figure 3**.

The system also encourages the development of local or Site Specific Operating Procedures (SOP's). The Management Procedures are supported by audit checklists, standard forms and attached examples as applicable and appropriate.

Compliance with the VIMS Standards and the Key Requirements of all Management Procedures is mandatory throughout Veritas. Veritas Divisions / product lines / sites use a combination of the Management Procedures, customized local Standard Operating Procedures (SOP's) and work instructions to manage their risks and comply with corporate and other requirements.

Compliance with the management systems and other requirements is continually assessed through a combination of internal and external audits.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 30 of 182

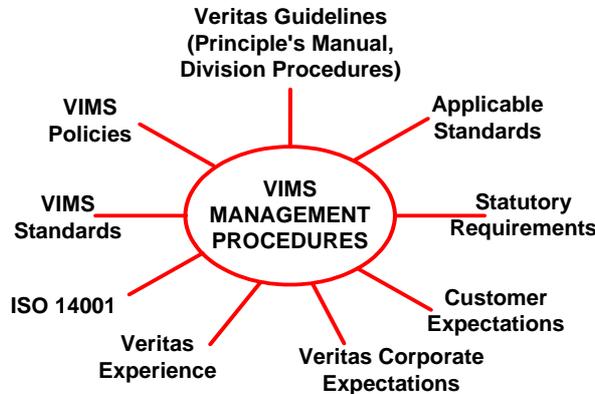

Figure 3 VIMS Management Procedure Inputs

While compliance with the Key Requirements of all Management Procedures is mandatory, Veritas businesses focus additional management attention on the HSE procedures, which control significant risks, and for which a high level of compliance needs to be assured. For the purpose of establishing the level of customization, training and auditing warranted the Management Procedures can be allocated into three categories:

Critical Procedures

Procedures that control significant risks and involve a number of people, work groups with significant staff turnover or otherwise require higher levels of management attention to assure the required level of compliance.

Critical Procedures usually require customization to meet local needs, widespread training of personnel and in depth internal and external auditing.

Typical field acquisition sites identify 20-30 Critical Procedures dependent on the nature of their operations and associated hazards. Lower risk sites, such as offices, may only identify a few Critical Procedures.

Regular Procedures

Procedures for which a lower level of management attention is needed to achieve the required level of assurance. Regular Procedures typically involve a smaller number of people and/or involve a lower level of risk. Regular procedures may still require customization to meet local needs. Training is usually restricted to the people directly affected, the frequency of internal auditing is often reduced to two to three yearly and the depth of internal auditing is reduced to verification that the key requirements have been met, with minimal auditing of the processes used to meet them.

Reference Procedures

Procedures that describe functions, which do not apply or are not required for normal operation. Training for Reference Procedures is limited to that required to ensure relevant people are aware of their existence. Auditing is limited to verification whether the activity has been required and, if so, were the Key Requirements met.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 31 of 182

The VIMS structure, shown in **Figure 4**, together with the Letters of Assurance and system audit reports provides the basis for demonstration that “due diligence” has been exercised in the control of risks throughout Veritas.

Feedback from the Letters of Assurance, audit reports and local implementation monitoring is analyzed to identify common weaknesses and areas to target for VIMS continuous improvement.

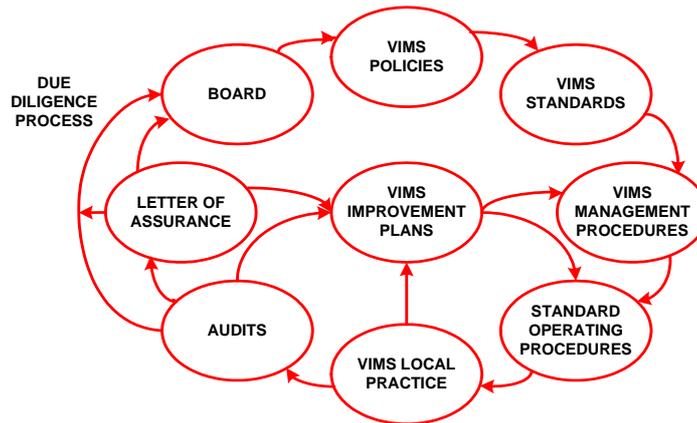

Figure 4 VIMS Documentation and process relationships including “Due Dilligence”

Distribution

The Veritas Integrity Management System is distributed to users in a Lotus Notes® database. Document control is maintained by an electronic system, with page numbering, document title, date of issue, date of printing and version code as shown in **Figure 5**.

The most up to date versions of all documents are stored electronically. Every printed document is considered to be uncontrolled and each printed page of the document has an advisory, inserted as a footer that it may not be the latest version. Documents are formatted to print on Letter or A4 paper and can be printed by every user within Veritas as required. Veritas users, including remote site users, can synchronize the VIMS databases from their own servers to individual PC’s through the internet, or via modem using satellite or land telephone lines world- wide. Regular synchronization ensures that the latest document version is always available to the end user.

All Veritas employees can access VIMS by using their own desktop computers through the Global VIMS Icon as shown in **Figure 6**.

Improvement Process

The Veritas Integrity Management System includes an in-built mechanism to continuously improve the performance of system users and to reduce costs through regular improvements to make the system more efficient and easier to use. (Figure 7) Implicit in this concept is the recognition that no system can ever be deemed to be perfect and that improvement is an ongoing process.

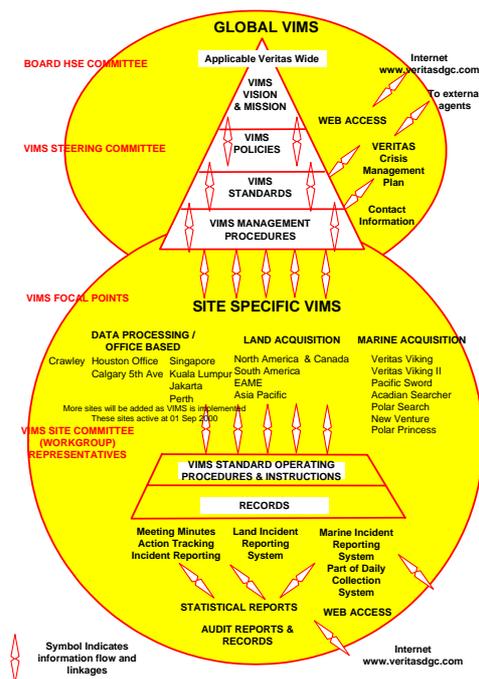

Figure 8 Electronic VIMS and Global and Site VIMS Communication Structure

Electronic VIMS

Electronic VIMS is represented in **Figure 8**. It comprises a series of Lotus Notes® databases interconnected and linked electronically. Lotus Notes® provides a reliable infrastructure to keep information up to date in all Veritas operations and is the corporate standard used to disseminate email, addresses, phone numbers and a variety of other global databases. This information is replicated to local servers at all Veritas sites. Remote locations such as vessels use satellite technology to permit replication. Local users access their site servers to replicate to their own desk or lap tops as required.

Provided replication is carried out regularly, the most up to date version of all VIMS documentation is always available.

At a local level, the VIMS site committee utilizes the Action Tracking Register (**Figure 9**) to record non- conformances arising specifically at their workplaces, the actions required and the person responsible for completion. This provides an auditable trail of actions completed and allows the setting of positive performance indicators such as the percentage of action items completed versus those raised and outstanding, committee meetings held etc. (**Figure 10**).

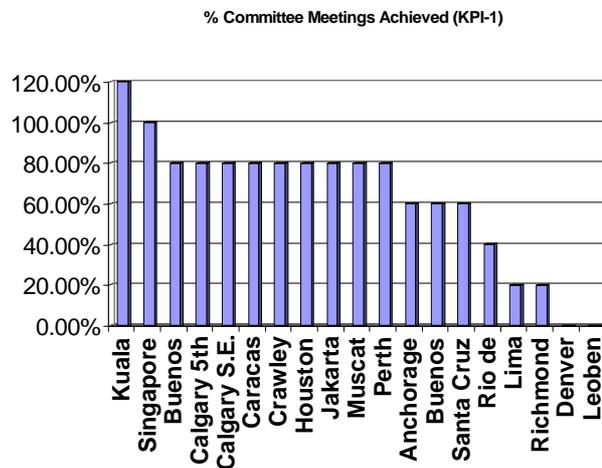

Figure 10 Committee Meetings July to November 03

All employees at every site have access to a common format Incident Reporting system. This database allows five major types of incident (Hazard / Near Miss, Occupational Injury, Property Damage, environmental Loss, Not Work Related) each with five or more types of outcome or potential outcome to be reported. Emails are sent on receipt of the report to subscribers who have indicated that they wish to know whenever these incidents are reported.

Reporting

For our field acquisition sites, VIMS is proving to be a valuable repository for "organizational learning" in the HSE area.

Conclusions

The full use of the potential capabilities of VIMS will take some time. Even at this stage of development VIMS promises to be a system that will add value to the status of the learning organization which is Veritas. VIMS will improve the dissemination of information including incident reports; it will permit a forum for employee involvement through committee meetings; it will provide a more formal structure for auditing and inspections and allow tracking of action points; finally VIMS will provide a more structured approach to the identification of hazards (in all of our work environments) and the assessment and control of risk. This will ultimately result in fewer losses thereby improving productivity and the bottom line.

3.3 Health Safety & Environmental Proactive Processes

Responsibility

Management Responsibility

While senior management has the ultimate responsibility for safety, it delegates authority throughout all management levels. The local manager has total responsibility for implementation, operation and improvement of the Veritas VIMS System within his area.

Line management are the key people in an HSE program because they are in daily contact with employees. Line managers are responsible for maintaining safe working conditions and directly implementing the HSE Program.

Alliance

HSE Alliances

HSE alliances can provide a closer long-term relationship for implementing preventative actions to avoid accidents, injuries and occupational illnesses. Permanent HSE improvement will not be accomplished through a relative HSE program. HSE alliances allow the customer / contractor the opportunity to implement proactive processes for continual improvement.

Hazard Identification And Risk Control

Identification

Recognizing and eliminating hazards is the basis of proactive HSE accident prevention and a key element of VIMS. Hazard identification highlights deficiencies, allowing guidelines to be implemented to improve existing work practices and control HSE aspects of the operations.

All field personnel shall be involved in the process of hazard identification, which is an individuals basic responsibility and condition of employment, and shall report unsafe conditions or practices, thereby bringing to management's attention, hazards, which may have been unobserved or not reported previously.

All identified hazards will be assessed for risk and added to the facility Hazard Register.

Unsafe Acts / Conditions

When unsafe acts or conditions are identified they shall be reported and corrected using the VIMS Incident Report format. Details of the unsafe act or conditions and the corrective measures shall be discussed in the Safety Committee meetings. Corrective measures not implemented shall be added to the tracking register.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 36 of 182

Near Misses

Near misses shall be reported using the VIMS Incident Report format

A successful safety program is directed at preventing, not correcting accidents. It is extremely important to report and correct near misses and eliminate them.

A near miss is defined as an unexpected, undesired event, which happens without any physical damage or injuries resulting from the event (but has the potential for loss).

All personnel shall be encouraged to report near misses and be actively involved in the analysis and corrective measures implemented. Near misses have high potential to become accidents. By correcting near misses, accidents can be prevented.

Hazard Notification

All recognized and reported near misses (which provide potential for loss) and accidents shall be investigated and analyzed to prevent recurrence. Details of all near miss/accidents shall be reported on the VIMS Incident Report format.

An investigation is an account of an event based on a conscientious examination of all contributory factual information about the event.

An analysis can produce information that leads to elimination or reduction of accidents and injuries. The actual results of an accident might be minor, but the potential loss could be major. Positive investigation is a vital part of effective accident and loss control.

Each Occurrence / Accident has two causes:

1. Immediate Causes
2. Basic or Root Causes

The immediate cause is usually the most apparent and "closest" to the near miss/accident. By proper investigation, the basic personal or job factors cause can be identified and the best corrective action taken to prevent recurrence.

A simple example of the immediate cause might be as follows:

Event: Worker slips on spilled oil. The immediate cause is that the oil was spilled on the floor. To determine the basic cause, the question of WHY the oil was spilled should be asked. Then by further investigation, the basic cause can be determined and corrected.

Job Safety Analysis

The ultimate goal is to eliminate hazards out of the working environment. All personnel shall use the Job Safety Analysis Forms and the Hazard Register to identify health and safety design improvements for equipment and chemicals for action where necessary.

Job Safety Analysis consists of six steps

1. **Select the process to be analyzed**
2. **Break the process down into steps**
3. **Determine where there are potential hazards, and eliminate where possible**
4. **Develop controls for those hazards (that cannot be eliminated)**
5. **Complete the form**
6. **Develop safe processes using the results**

HSE Physical Audits

HSE Physical audits are conducted on buildings, equipment, machinery and tools to identify hazards.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 37 of 182

HSE Audits shall be performed annually by a qualified line manager or delegated personnel or 3rd party.

Personal Protective Equipment

The correct personal protective equipment shall be provided and worn by all personnel whenever required in designated areas, or when performing specific functions. Line management shall be responsible for ensuring adequate and quality PPE products are utilized by the personnel under their control.

HSE Education And Training

HSE Training

HSE training shall be based, as a minimum, on the recommendations specified by the IAGC, OGP, OSHA or other agencies. Also they may be in conformance with ISO 9001. HSE training requirements for each job classification are specified in the OGP guidelines.

All managers shall be responsible for ensuring that all their staff are properly trained in the methods and skills required to perform their tasks, and have adequate "in field" emergency response training to suit their working environment

Safety training for all personnel shall be conducted using the programs approved by Veritas Marine Acquisition Management. Additional safety training shall be given if required by local rules and regulations, or to benefit the advancement of an individual to a standard that is an additional asset to the Company or facility.

Orientation / Induction Training

Orientation training for new personnel shall include HSE training as required by industry guidelines. All personnel joining a crew shall be given a comprehensive, full facility induction within the first 24 hours of joining the crew.

HSE Records

All HSE training of personnel shall be recorded and documented. These records will be as required by Veritas Marine Acquisition Management.

Engineering And Construction

HSE Design

Correct design and construction of equipment, components and assemblies are basic requirements for a safe operation. All equipment shall be considered not suitable for use unless certified according to a specific standard as determined by the regulatory body governing the items manufacture.

Assessment of suitability of any product is carried out by the department manager utilizing the expertise of the Acquisition Technology Group; Operations or Field Service and an assessment for risk shall be undertaken with the assistance of the HSE department.

When the design, construction and application of any item is approved, correct measures shall be implemented to ensure personnel are trained in the operation and maintenance of the new product, and will be responsible for the correct commissioning of the product into the operation, incorporating the formulation of written procedures and Job Safety Analysis.

Inspections of existing equipment designs and applications shall be carried out to ensure that equipment and components are utilized within their safety critical limits, and evaluations made on redesign of applications based on field experience or different techniques.

Preventative Maintenance

A sound, efficient, maintenance program is essential. When machinery, equipment and tools are

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 38 of 182

properly maintained, they are easier to work with, and employees tend to work safely. A good program will keep equipment, tools and machinery in good condition and will be reflected in the safety record. A documented preventative maintenance program will be established and maintained for review and approval by line management.

HSE Publicity / Motivation

Posters, Banners, Bulletins

Health, Safety and Environmental guidelines, hazard warnings, and other health and safety information shall be communicated to all personnel, using poster, banners, and bulletins, or other appropriate methods.

Safety Awards and Incentives

An internal system shall be developed to monitor HSE related performance of field personnel with a view to providing an Award/Incentives scheme to provide recognition to personnel for accident-free working hours and safe conduct during all operations.

Management HSE Meetings

Health, Safety and Environmental meetings are an excellent means of communicating needs, problems and objectives. Health, Safety and Environmental meetings allow personnel to have a voice in safety by sharing concerns and recommending ways to improve the safety program.

Line management shall hold Health, Safety and Environmental meetings each month, or more frequently as required. Local line management will always be present at these Health, Safety and Environmental meetings, which ensures that all management personnel are involved in the discussion of HSE matters and the review and analysis of incidents, accidents or emergencies that have occurred in the preceding period. This forum will allow all persons present the opportunity of expressing concerns or opinions on necessary corrective actions and help promote HSE awareness.

Personnel Involvement

HSE Meetings

Crew HSE meetings shall be held on a bimonthly basis. These meetings will be attended by (a minimum) all senior personnel from the Geophysical and Marine crews, along with Client and Contractor representatives and will be known as the Safety Committee. Weekly activities, ongoing projects and tasks, concerns and incidents will be discussed in detail, and action points added to a

Tracking Register. Minutes of these meetings will be taken and entered into the VIMS reporting system.

While it shall be the goal to have all personnel attend each Health, Safety and Environment meeting, this may not always be possible during regular operations. Line management shall distribute all relevant information discussed during the Health, Safety and Environment meetings to absent personnel.

General safety meetings with all facility personnel in attendance shall be conducted monthly and at the start of all new survey operations.

On-site pre-job HSE meetings, i.e. toolbox meetings, shall be conducted and recorded prior to new operations or when a task, outside of the normal operations is required. The task will be assessed for risk, and responsibilities clearly delegated.

Emergency Response Drills

Regular drills give personnel a better ability to respond to emergency situations that may develop at their worksite.

Emergency response drills for field crews shall be performed weekly, and as a minimum, these

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 39 of 182

drills shall include fire and emergency evacuation. Drills should be detailed and organized practical demonstrations, with minutes taken. Line management shall ensure that the drills are held at the required frequency and that the content is applicable to the working environment.

Line management should ensure that drills are varied in their content and scenarios to help develop and encourage increased safety awareness.

Responsibilities for Working Safely

All personnel shall be responsible for performing their jobs safely. Safety is a full time responsibility both on and off the job.

Environmental

Environmental Protection Responsibilities

Veritas DGC Management recognizes their responsibilities to protect the environment. Our business will only be conducted in consultation with regulatory bodies in order to minimize the potential of any permanent damage to the environment.

Personnel Health Protection Responsibilities

Veritas DGC Management recognizes its responsibilities to protect the health of its personnel, and shall continuously strive to improve our products, services and processes to protect the health of our personnel.

Field conditions shall be monitored to ensure hygiene, sanitation and ergonomic standards are maintained to a suitable standard.

HSE Contingency Planning

Project Specific HSE Plan

A Project Specific HSE Plan shall be developed for all operations, defining the specific safety practices, resources, and sequence of safety activities relevant to a particular service contract, project, or product not covered by the HSE Management System or facility Safety Case.

Management and Group Leaders of each facility are responsible for evaluating any change in standard operating practices, and formulate the plan that shall clearly define amendments required to the facility's procedures and will detail any known hazards, formalities, requirements and conditions that may be encountered during a project, and procedures to follow when particular incidents are encountered.

Emergency Response and Crisis Management Planning

Planning for unpredictable and potentially catastrophic events outside of the normal operating boundaries of a particular business unit can assist field crews and line management to be better prepared for such an event.

Corporate management shall appoint Crisis Management Officers at each company facility and develop a set of procedures to be followed during a crisis.

Contractor HSE

HSE Procedures

Contractors and subcontractors performing work for Veritas DGC shall conduct their work to a standard that is no less than the minimum required by Veritas DGC as detailed in this document, and in accordance with the requirements of the management and regulatory bodies by which the contractor operates.

All local rules and regulations concerning HSE requirements will be strictly adhered to and documented for review by Veritas DGC line management, to ensure standards are maintained to a satisfactory level.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: H.S.E. Management System		Page 40 of 182

Reporting

HSE related reports, in compliance with policies and procedures in place, shall be a requirement throughout all levels of the Company. Reports will be directed through all levels of line management for appropriate review and action, with analysis and management review being undertaken by the HSE department.

Reporting from all field facilities shall include the following:

Accidents, incident, damage or near miss reports

Inspection and audit reports

Tracking registers, progress reports and risk analysis

Minutes of all meetings

Statistics

Personnel evaluations and training

4.0 HSE Management Organization & Responsibilities

4.1 Management HSE Organization & Responsibilities

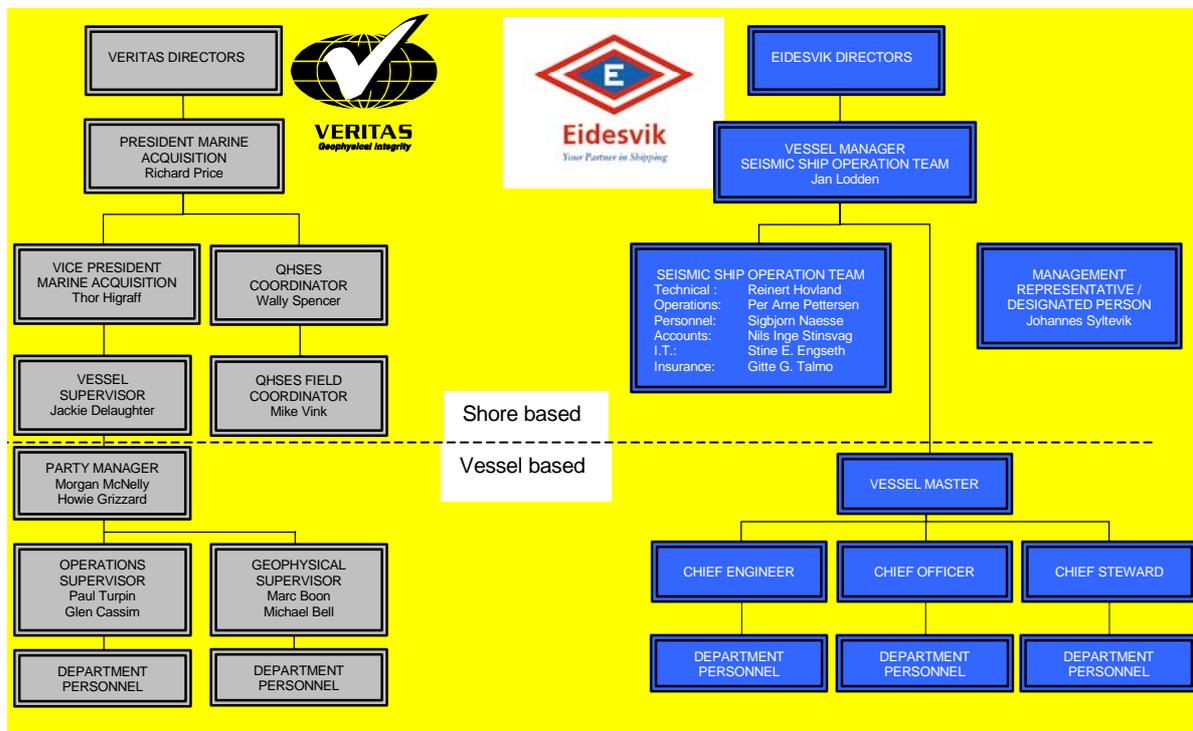

Figure 11 HSE Management Organizational Chart

(Note: The personnel assigned to the above positions may change, as operations require. For the current names of onboard personnel please refer to the Veritas electronic Document Collection System (DCS) crew list database.)

SAFETY POLICY ORGANIZATION AND RESPONSIBILITIES

President & Chief Operating Officer

The President & Chief Operating Officer is responsible to the Board of Directors of Veritas DGC and Veritas Marine Acquisition for the implementation of the Health, Safety and Environmental policies, throughout the company.

The President is at the top of the Safety Management chain and is committed to safety at all levels of the company's operations.

President of Marine Acquisition

Authority for the implementation of the Health, Safety and Environmental policies is delegated by the President to various executives responsible for individual areas of operations.

It shall be the specific responsibilities of these executives to:

- ensure that the specific responsibilities for implementation of the health, safety and environmental policies are properly defined and delegated;
- ensure that the effectiveness of the policy is regularly reviewed and revised as and when necessary;
- ensure that the appropriate company resources are allocated to meet the requirements of the policy;
- promote and support VIMS (Veritas Integrity Management System) through its direction by the VP of HSE.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 42 of 182

VP Health Safety Environment

The VP of HSE is responsible for advising the Chief Executive, Executive Directors, Departmental Manager and all other company personnel on matter relating to health, safety and the protection of the environment. The VP of HSE:

- assist company management in establishing the necessary health, safety and environment standards, procedures and training required in the policy;
- coordinate the implementation of the safety policy and establish Enhanced Safety Management programs within the company.
- review all reports on accidents, incidents, and near misses and in consultation with the Department Manager, the Insurance Department and the Head of Legal Affairs, ensure that a full investigation is carried out and appropriate remedial action is recommended to company management.
- advise company management on procedures to ensure that all operations, vessels and offices as well as all other premises and facilities operated by the company, comply with policy.
- conduct independent health, safety and environmental inspections and audits of all company operations, vessels, facilities, offices and other premises and prepare the necessary reports for company management review.
- provide technical assistance to all departments on issues relating to health, safety and the protection of the environment and encourage the development of a high level of health, safety and environmental "awareness" at all levels of the company.
- ensure that all of the company operations and all associated equipment are of such a design and construction and are so maintained, as to minimize the risk to health, safety, and the environment.
- ensure that procedures are established and implemented to provide company personnel with the necessary information, instruction and training to enable them to carry out their duties in a safe manner and without detriment to health and the environment.
- encourage health, safety and protection of the environment "awareness" within all areas of operation.
- liaise with all relevant concerns on company matters pertaining to health, safety and the environment.
- in conjunction with company management, ensure that the company's views and endeavors on health, safety and the protection of the environment are considered and recognized by interested parties through contract terms and conditions.

Department Managers, Vessel Supervisors, Party Managers

All Department Managers are responsible for ensuring that all company personnel, for whom they are responsible, know that as Veritas Marine Acquisition employees they are required to adhere at all times to the safety policies and its supporting standards and procedures. In addition, each Department Manager will:

- ensure that the arrangements for implementation of the safety policies and standards are met, carried out and enforced;
- review and place into action, all recommendations from the Safety Department for improving the standards of health, safety and the protection of the environment, within their area of responsibility;

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 43 of 182

- ensure that all company operated facilities, vessels equipment, offices and other premises, so far as is reasonably practicable, are safe and without risks to the health and safety of the employees and the environment;
- ensure that routine maintenance programs of all company operated facilities, vessels, equipment, offices and other premises, under their control, are established and implemented in accordance with company standards, recognized industry practices and applicable legislation.
- make arrangements for all company personnel under their control to be thoroughly briefed on each job, prior to commencement of the work, so that they fully understand what is required of them, together with any precautions that need to be taken;
- encourage all company personnel to promptly report potential hazards, unsafe conditions, unsafe acts and near misses to the appropriate Department Manager. The Department Manager shall take or ensure that immediate appropriate action is taken to deal with these and advise the Safety manager of the actions taken.
- ensure that regular inspections are carried out to identify potential hazards, unsafe conditions or unsafe acts and take appropriate remedial action;
- encourage company personnel, if a situation warrants, to report unsafe situations directly and in confidence to either the VP of HSE or ultimately to the Executive Directors or the Chief Directors or the Chief Executive;
- in conjunction with the QHSES Coordinator, ensure that additional procedures are developed to cater to special risks and circumstances arising in the course of the company's business;
- ensure in all work areas, that a safe work system is operated. Where potentially hazardous situation exist, a "Permit to Work" procedure shall be used, if appropriate;
- ensure that emergency procedures are maintained and cover all potential incidents relevant to the particular location. Where appropriate, these or relevant parts of these should be displayed on notice boards throughout each location. Alarms and the procedures amended and additional training given to personnel.

All company personnel must familiarize themselves with the emergency alarms and procedures applicable to the location where they are employed.

Company Personnel

It is the statutory responsibility of all company personnel to take reasonable care of the health and safety of themselves and of other persons who may be affected by their acts or omissions at work. All company personnel will;

- familiarize themselves with the provisions of the policy and any specific rules or procedures relating to health and safety at work and environmental protection;
- comply with the policy and its supporting rules or procedures;
- promptly report any near misses, accidents, incidents or dangerous occurrences to their manager and cooperate fully in any investigation;
- cooperate with company management on matters relating to health, safety and the protection of the environment and, where appropriate, discuss with and/or assist their manager in resolving matters relating to health, safety and the environment;
- ensure that any company equipment issued to them, or for which they may be responsible, is correctly used and properly maintained;
- wear protective equipment whenever instructed or it is recommended to do so;

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 44 of 182

- be responsible for good housekeeping in the area in which they are working;
- immediately report any potential health, safety and environmental hazard to their manager.

VERITAS DGC HSE

Training

Company health, safety and environmental training standards shall be developed and maintained by the Corporate HSE Manager. Each Department Manager shall identify the health, safety and environmental training needs of their subordinates and make appropriate arrangements for training to be conducted with the Vessel Supervisor and QHSES Coordinator.

Training programs include, but not limited to:

- 1) Offshore survival.
- 2) Helicopter Underwater Escape (HUET).
- 3) Helicopter Landing Officer (HLO).
- 4) Fast Rescue Craft Coxswain (FRC).
- 5) Fire-Fighting.
- 6) Advanced First Aid and AED training.
- 7) TapRoot - root cause analysis training.

Awareness Programs

Where appropriate, the QHSES Coordinator in conjunction with Departmental Managers shall introduce programs to raise the profile of key health, safety and environmental issues and to encourage and maintain a high level of health, safety and environmental awareness of all personnel.

Systems currently in use include, but not limited to:

- 1) Regular meetings.
- 2) Use of safety awareness media throughout the ship.
- 3) Use of supervisory structure to promote safe working practice.
- 4) Safety award program.

Protective Equipment

The HSE Department, the QHSES Coordinator and each Departmental Manager shall ensure that protective equipment is provided, where it is evident that the person's job requires it. All equipment should conform to a relevant standard or equivalent or, in the absence of such a standard, a company policy standard.

Accident Investigation and Reporting

All accidents, incidents and near misses must be reported to the responsible Departmental Manager and QHSES Coordinator, who will copy the reports to the President of Marine Acquisition and the Insurance Department. The QHSES Coordinator, in conjunction with the Departmental Managers, shall develop and implement procedures to ensure that all accidents, incidents and near misses are properly reported, investigated and appropriate remedial action taken.

Employee Health Monitoring

Each Departmental Manager shall ensure that where potential health hazards to company personnel exist, these are identified and, as far as is reasonably practicable, minimized. All company personnel in potential health risk areas of employment shall be made aware of the

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 45 of 182

potential risks. Arrangements will be through the Departmental Manager for them to have any additional medical examinations necessary.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 46 of 182

Sub-Contractor Health & Safety

Each Departmental Manager, with assistance where appropriate from the QHSES Coordinator, shall ensure that all sub-contractors used within their area of responsibility properly address health, safety and the protection of the environment. Review of sub-contractors' health, safety and environmental policy and procedures shall form an integral part of the contract selection process. All contractors shall be obligated in their work for the company to comply with all applicable health, safety and environmental laws and meet good industry standards.

Occupational Health and First Aid

The QHSES Coordinator shall ensure that the Company employs appropriate qualified medical staff and/or trained First Aid personnel. Departmental Managers shall identify the requirements for such staff and ensure that appropriate equipment is maintained at each company location within their area of responsibility, to meet with standards set by the company. Departmental Managers must concern themselves with the occupational health of all personnel for whom they are responsible and any cases causing concern should be directed to the appropriate medically trained person(s) at the location or to the QHSES Coordinator.

Environmental Protection

Departmental Managers shall ensure that potential environmental impacts of any operations under their control are identified and the necessary actions taken to minimize these prior to the startup and during all operations.

Company Standards

Generally the health, safety and environmental standards adopted by the Company shall be those specified in relevant government legislation, codes of practice and guidance notes together with recognized international industry and or industry association standards and practices. Where it is deemed appropriate, these shall be further developed and improved by the Company. All standards adopted by the company will be progressively published as company standards. This activity shall be coordinated through the VP of HSE.

Design Construction and Operation of Company Operated Facilities

Departmental Managers shall ensure that company operated vessel, facilities and equipment, within their areas of responsibility, are designed, constructed, operated and conform to accepted company/industry standards and applicable legislation Construction and/or dry dock work should be properly supervised throughout its duration and systematic safety reviews and hazards analysis should be conducted during all design, construction or repair phases. Operating procedures shall be developed and followed and regular safety inspections conducted during all operations.

Technical Assistant and Support

The QHSES Coordinator shall provide technical assistance, guidance and support to all company personnel in the implementation of this policy.

Health, Safety and Environmental Inspections and Audits

The QHSES Coordinator or designate shall conduct independent inspections and audits of activities at all company locations. These may be conducted with or without prior notice. The level of activity at the particular location shall govern their frequency.

If in the opinion of the QHSES Coordinator, any serious risk or hazard identified during an inspection/audit represents an imminent risk to health, safety and environment, the responsible Division Manager must decide whether it shall be remedied immediately and/or the facility shut-down until appropriate action has been taken.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 47 of 182

As soon as practical after the inspection/audit, a report shall be prepared detailing any specific health, safety and environmental hazards noted during the inspection/audit and the action taken or recommendations made to minimize, if not eliminate them. Should the report identify a hazard and recommend remedial action, further inspection/audits shall take place to ensure that the hazards has been minimized, if not eliminated.

A qualified third party shall also perform audits at intervals determined by the President of Marine Acquisition.

Policy Review

The QHSES Coordinator shall report on and review company performance with respect to this policy on a regular basis with Division and Corporate Management, this will ensure problems are properly addressed and monitored and where necessary, improve the health, safety and environmental standards within the company.

4.2 Field Personnel HSE Organization & Responsibilities

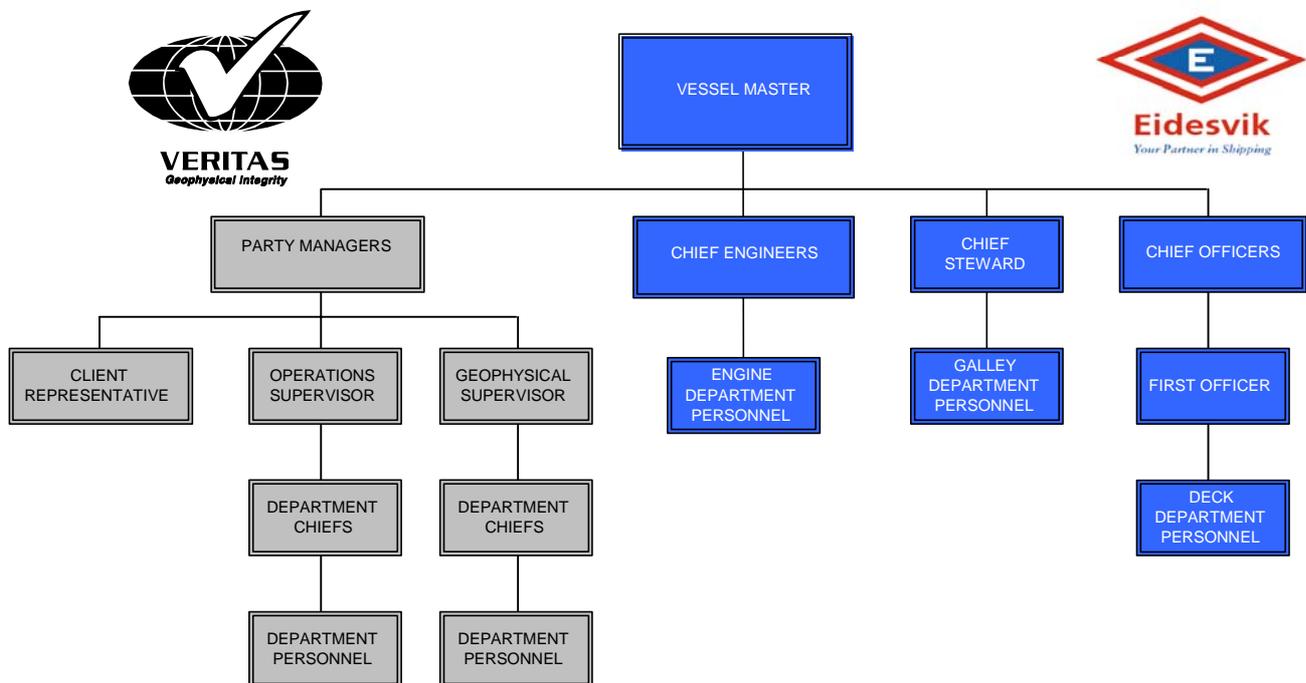

Figure 12 Field HSE Organizational Chart

**SR/V Veritas Viking 2
Organisation Diagram**

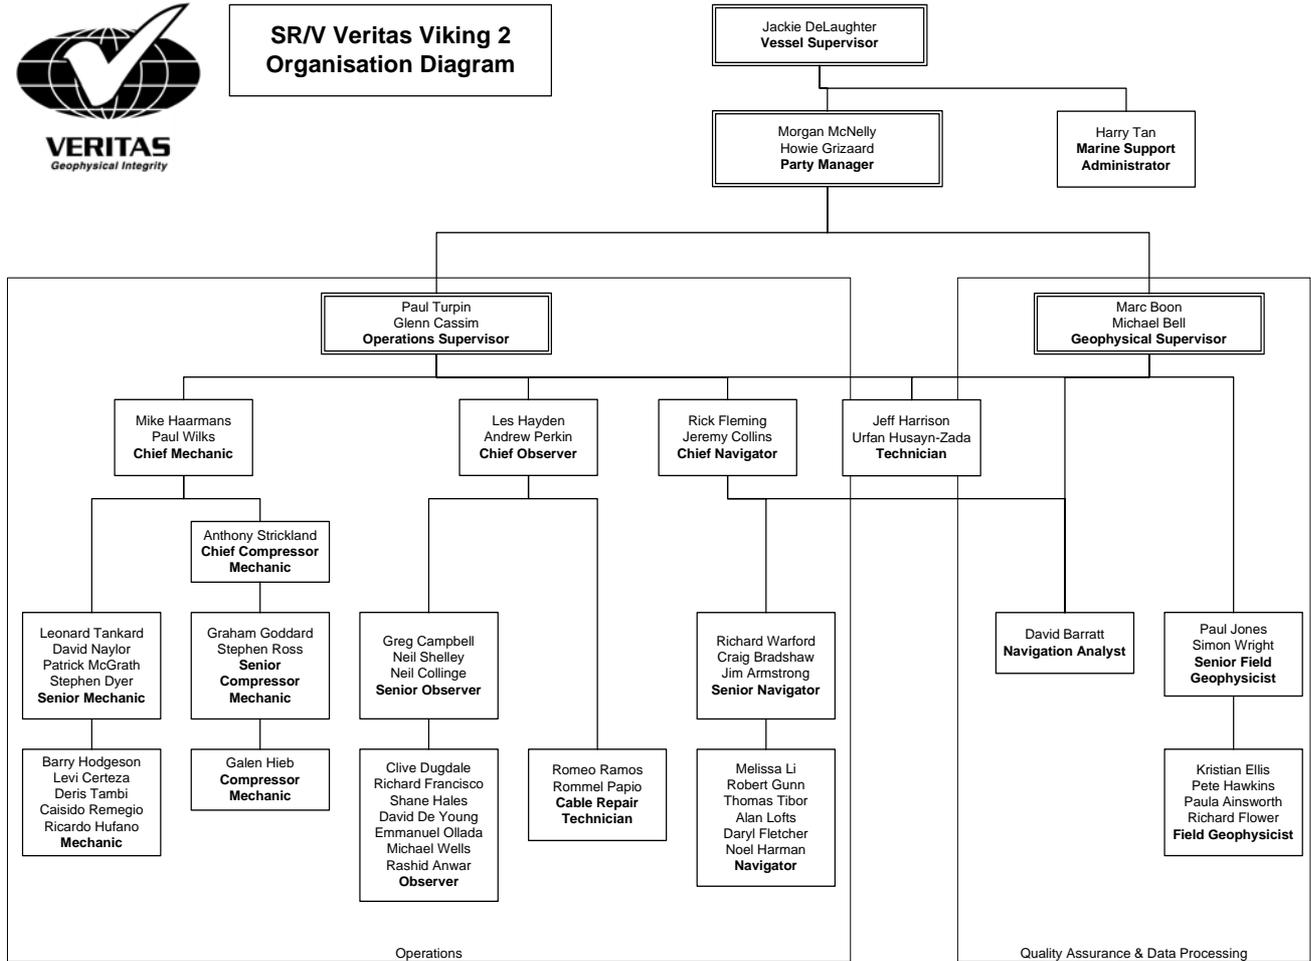

Figure 13 Vessel Organizational Diagram

(Note: The personnel assigned to the above positions may change, as operations require. For the current names of onboard personnel please refer to the Veritas electronic Document Collection System (DCS) crew list database.)

The Project Vessel Supervisor, Regional QHSES Coordinator and Regional Marine Manager will administer project Safety Management.

Marine Safety

Onboard either vessel, as is normal procedure, the Master of the vessel is ultimately responsible for all operations onboard his vessel, and is assisted in this role by Chief Officer, Chief Engineer, Party Manager and Operations Supervisor. The Master, at his discretion, can overrule any instruction issued by the seismic crew Party Manager or any other person, if he feels that this action would compromise the safety of any person involved or the safety of his vessel. The Master of the vessel maintains the ships log detailing daily operations and safety drills, change of instructions, accidents and safety reviews. The Party Manager will maintain a separate log of weekly drills and meetings in the VIMS reporting system.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 49 of 182

The Master and/or Party Manager and Safety Office will maintain a regular series of inspections of the vessel, purely to review the vessels safety status. These inspections will be carried out weekly and the results of the inspections will be discussed at each safety meeting and the necessary action points noted in the meeting minutes and added to the Action Point Tracking Register.

Master

The Master is responsible for the overall control of the vessel under their command and for ensuring the safety, health and welfare of the personnel on board.

The Safety aspects of the Master's duties include, but are not limited to, the following:

- Ensuring that the vessel is safely navigated and operated in accordance with the requirements of the Owners and Veritas DGC instructions and statutory regulations as governed by;
- The watch keeping standards laid down in the International Convention on Standards of Training, Certification and Watch keeping for Seafarers, 1978 (STCW 1978).
- The Convention on the International Regulations for Prevention Collisions at Sea, 1972 (COLREG 1972) and Amendments.
- Chapter V SAFETY OF NAVIGATION, OF SOLAS 74/78 Convention incorporating 1981/1983 Amendments.
- Ensuring that the vessel's safety equipment is maintained to the standards required by governing body and owner or Veritas DGC instructions.
- Ensuring that emergency drills are conducted in accordance with the company requirements and the standards or relevant sections the ships governing convention.
- Ensuring that the vessel's radio station is operated and maintained in accordance with the relevant Radio Regulations and the standards of SOLAS 74/78 and Amendments. Chapter IV - RADIOTELEGRAPHY AND RADIOTELEPHONY.
- Ensuring the Health, Safety and Welfare of all crew and charterer's personnel.
- Issuing necessary safety instructions to cover any work being undertaken.
- Ensuring that the vessel's working operations are conducted in a way that will avoid injury to personnel and damage to owners, Veritas DGC's and/or others property.
- Ensuring that incidents which prejudice any of the foregoing requirements are brought to the attention of Owner, Veritas DGC and others as soon as possible.
- Ensuring that upon departure from any place, the vessel is ready in all respects for the intended passage, is seaworthy and is properly manned, equipped and supported.
- Complying with, at his discretion, all instructions, standing orders and regulation laid down by Owner or Veritas DGC having due consideration for the safety of life and the vessel.
- Working with the Party Manager to ensure that there is effective two-way communications between the vessel and shore.
- Working with the Party Manager to ensure that proper arrangements are established for use in the event of an emergency involving the vessel or any trailing gear or equipment on board, so that there is no delay in executing the correct procedures and contacting the necessary shore based personnel.
- Delegating to his subordinates, at his discretion, any of the work involved in the performance of an assigned task together with the necessary degree of authority. However, the obligation to ensure proper and timely completion of that task remains with the Maser.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 50 of 182

- Keeping up, or arranging the upkeep and preparation of all log books, records, reports, correspondence and other documentation required by Eidesvik, Veritas DGC, Port Authorities, Classification Societies, Governments and other regulatory bodies, as appropriate.
- Obtaining appropriate advice/guidance from specialist departments including safety, on matter affecting the health and safety of their department.
- Advising Owner Management and Veritas DGC Management immediately of any deficiencies in equipment, standards, procedures or training.
- Working with the Party Manager and Operations Supervisor in arranging consultation with Line Supervisors and (where appointed) employee representatives on health and safety matters affecting the work area and ensuring that all personnel are advised accordingly.
- Working with the Party Manager and Operations Supervisor in initiating corrective action on receipt of accident/incident reports involving health and safety matters.
- Working with the Party Manager and Operations Supervisor in initiating appropriate action following safety meetings to rectify any unsafe situations highlighted.
- Providing leadership for the vessel's compliment of a quality that will encourage each man to perform at the best of his ability and develop to his fullest potential.

Deck Officers (Chief Mate, 2nd Mate)

The Deck Officers are responsible for assisting the Master in the operation of the vessel to the standards laid down by Owner requirements and Veritas DGC instructions and Statutory Regulations.

The safety aspects of their duties include, but are not limited to the following:

- Ensuring that when they are in charge of the vessel it is navigated in accordance with the terms of reference laid down by the Master's Standing Orders/Night Order Book.
- Ensuring when necessary, they keep radio watches in accordance with the Radio Regulations and requirements of Chapter VI of SOLAS 74/78 and Amendments.
- Prior to every departure, prepare calculations of the vessels stability and trim.
- Plan the routing and speed of any voyage.
- Responsible for the loading and unloading of any cargo and prior to departure, verify that all cargo is sufficiently lashed.
- Under the direction of the Master, ensuring that the radio and safety equipment is maintained and operated to the standards laid down by governing body and owners or Veritas DGC instructions.
- Assisting in the conduct of the required emergency drills and the training of the crew in emergency duties.
- Assisting in maintaining the Health, Safety and Welfare of the vessel's compliment and is responsible for the inventory and readiness of the ships medical locker and hospital.
- Assisting in ensuring that the vessel's working operations are conducted in a way that prevents injury to personnel and damage to property and equipment.
- The Chief Mate will in conjunction with other department heads (Including Seismic Personnel), be responsible for advising on and preventing unsafe working conditions and practices on board the vessel and when in port. He will pay particular attention to areas associated with fire hazards, e.g. paint lockers and storerooms. Cleanliness and good housekeeping practices eliminate potential hazards. Mechanical and electrical defects will be reported to the Engineering Department (Chief Engineer) for necessary action.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 51 of 182

Chief Engineer

The Chief Engineer is responsible to the owners, the Master and Veritas DGC for the upkeep, maintenance and operation of all machinery. In addition he is responsible for the safety, supervision and organization of crew members when employed in machinery spaces.

The safety aspects of his duties include, but are not limited to the following: -

- Ensuring that Engine Room watches are conducted to the standards laid down in the engine room watch keeping section of the International Convention on Standards of Training, Certification and Watch keeping for Seafarers, 1978 (STCW 1978).
- Ensuring that the mechanical and electrical safety equipment of the vessel is maintained to Eidesvik's standards and those required by governing body. These items include, but are not limited to: Fire Pumps, Fire Mains and Hydrants, Fixed Fire Fighting Equipment, General Alarms, Fire Alarms, and Detection Systems, Remote Closing Valves, Deck and Engine Room Electrical
- Emergency Shut Downs, the power supply to Navigation Lights and other safety items requiring electrical power for operation.
- When required he will assist and advise the Back Deck Supervisor or Crew Leader with the following (but not limited to): fast Rescue craft Engines, Hydraulic Davits/ Cranes and any hydraulic powered items.
- Assisting in all aspects of emergency drills, which have particular reference to the operation of mechanical and/or electrical systems.
- Assisting the Master in the health, safety and welfare of personnel employed in the engineering department.
- Assisting in ensuring that the working operations are conducted in a way that avoids injury to personnel and damage to property, with particular reference to the operation of mechanical and electrical systems.
- Reporting to the Master any shipboard occurrence, condition or significant body of opinion, of which the Master may be unaware, and which may affect the efficient working or safety of the vessel or the well being of those on board.
- Delegating to his subordinates, at his discretion, any or all of the work of an assigned task, together with the necessary degree of authority. However, the obligation to ensure proper and timely completion of that task remains with the Chief Engineer.
- Responsible for the safety measures taken during bunkering and transfer of oil products.
- Requisition and inventory of sufficient spare parts.

Engineering Officers (1st & 2nd Engineers)

Engineering Officers are responsible for assisting the Chief Engineer in the performance of his duties, as outlined in the Chief Engineers responsibilities, and as directed by him.

The safety aspects of their duties, but not limited to:

- Conducting their watches in accordance with the requirements of the engine room watch keeping section of the International Convention on Standards of Training, Certification and Watch keeping for Seafarers, 1978 (STCW 1978).
- Active participation in emergency drill and the training of vessel's personnel in the machinery aspects of safety equipment.
- Ensuring the Health, Safety and Welfare of personnel working under their direction in connection with the machinery on board.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 52 of 182

Crew Members (AB's, IR's, Stewards & Cooks)

These crew members have a responsibility to ensure that their actions or omissions do not cause injury to, or compromise the Health, Safety and Welfare of, other members on board.

It is their duty to participate in emergency drills as required by the Master and directed by the vessels Officers. They are to be acquainted with the location and operation of all fire fighting, lifesaving and other emergency equipment on board.

Seismic Operations Safety

The Master is ultimately responsible for the safety of the ship and personnel. The Party Manager is responsible for the geophysical operation of the vessel. It is the responsibility of the Master and Party Manager to ensure that the operation of any of the ship's equipment is only performed by experienced personnel. Everyone is responsible for ensuring that their subordinates have had the necessary training for the task in hand. If this is not the case, the fact should be identified to the Immediate Supervisor and the Marine Operations Manager, or if possible rectified immediately by providing the person with the necessary facts and training required either on the vessel or at a specialized center.

Party Manager, Operations Supervisor, and Geophysical Supervisor

The Party Managers and their direct reports are in charge of the overall running of the seismic crew and the operations this crew and vessel may carry out. Bearing in mind that, the Master may override any decision that the P.M. makes, if the Master deems such decision as to compromise the safety of the vessel or personnel on board.

The safety aspects of their duties include, but are not limited to the following:

- The P.M. is to ensure that all company policies and procedures are followed correctly. To this extent he will work with the assistance of the Operations Supervisor and Veritas DGC management.
- Ensuring that weekly emergency drills are carried out in accordance with Veritas DGC's requirements and standards.
- Ensuring the Health, Safety and Welfare of the Seismic personnel and contractors personnel.
- Where necessary, issuing safety instructions to cover any of the work being undertaken.
- Ensuring that Seismic operations are conducted in a way that will avoid injury to personnel, property, environmental or equipment damage.
- Ensuring that incidents, which prejudice any of the foregoing requirements, are immediately brought to the attention of Veritas Marine Acquisition, the Client, and any relevant authorities.
- Working with the Master of the vessel to ensure effective two-way communications is established between the vessel and shore.
- Ensuring that prior to departure from any place all Seismic personnel are fit for duty.
- Working with the Master to ensure that proper arrangements are established for use in the event of an emergency involving the vessel, trailing gear, on board equipment or personnel, so that there is no delay in executing the correct procedures and notifying the relevant shore based personnel or authorities.
- Keeping up, or arranging the upkeep and preparation of daily records, reports, correspondence and other documents required by Veritas Marine Acquisition and it's Clients.
- Obtaining appropriate advice/guidance from specialist departments including safety, on matters affecting the Health, Safety and Welfare of his charges.
- Advising Veritas Marine Acquisition Management immediately of any deficiencies in equipment, standards, procedures or training.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 53 of 182

- Working with the Master and Operations Supervisor in arranging consultation with Line Supervisors and (where appointed) employee representatives on health and safety matters affecting the work area and ensuring that all personnel are advised accordingly.
- Working with the Master and Operations Supervisor in initiating corrective action on receipt of accident/incident reports involving health and safety matters.
- Working with the Safety Committee Members in initiating appropriate action following safety meetings to rectify any unsafe situations highlighted.
- Providing leadership for the vessel's compliment of a quality that will encourage each man to perform at the best of his ability and develop to his fullest potential.
- Promoting Safety Awareness throughout the vessel.

Chief Observers

Observers are responsible for the quality control of acquired seismic data. They report directly to the Operations Supervisor and Party Manager. The Observers are the leaders of their respective shifts and it is their responsibility to ensure that all persons on their shift follow the specific guidelines set down for each and every task in their control. They are responsible for the safety of reel deck operations, i.e. streamer deployment and recovery.

The safety aspects of their duties include, but are not limited to the following:

- Delegating to their subordinates, at their discretion, any of the work involved with the seismic operation, with the necessary degree of authority. However, the obligation to ensure proper and timely completion of that task remains with the Chief Observer.
- They have their own safety check lists that must be submitted to the Safety Committee each week. When a discrepancy is found they will take the necessary actions to rectify the problem.
- In the Party Manager's absence the Chief Observer is to ensure that all HSE standards are followed.
- The Observers will take an active roll on the Safety Committee.
- Working with the Safety Committee Members in initiating appropriate action following safety meetings to rectify any unsafe situations highlighted.
- Providing leadership for the seismic crew members of such a quality that will encourage each person to perform at the best of their ability and develop to their fullest potential.
- Promoting Safety Awareness throughout the vessel and to all who sail with it.

Chief Navigators

Navigation personnel report to the Operations Supervisor and Party Manager. They will assist with the Bridge Officers in ensuring a safe passage for the vessel at all times. Navigators will also take charge of any positioning equipment that may be deployed and any problems arising with any antennae concerning the onboard navigational equipment.

When the Streamer is being deployed and once in the Tow Position, navigators will monitor the Streamer at all times. They will notify the Bridge and Gun Mechanics of line change times and any turns that may be required.

The safety aspects of their duties include, but are not limited to the following:

- In the event of an emergency they will take a position/fix of the location of the vessel at the time of hearing the alarm. They will monitor the VHF radio on the working channel being used for the prospect.
- Reporting any electrical faults concerning the navigational equipment directly to the on board Technician.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 54 of 182

- Ensuring that their actions do not compromise the Health, Safety and Welfare of the vessel and any of the crew members on board.

Participating in emergency drills as required by the Master and directed by Officers of the vessel.

Chief Mechanics

Chief Mechanic reports directly to the Operations Supervisor and Party Manager. They are in control of all high pressure systems onboard (air and hydraulics). They will, at times, request assistance from the Engineers onboard. They will assist the Gun Mechanic in ensuring that all safety procedures are met while working the Gun deck.

The safety aspects of their duties include, but are not limited to the following:

- Maintenance, in conjunction with the Chief Engineer, of the Fast Rescue Craft/Work Boats, including engines and propulsion systems of these boats.
- Maintenance of hydraulic systems to winches, cranes and davits.
- Ensuring the safe supply of compressed air for the deployed energy source.
- Assisting in the conduct of emergency drills as required by the Master and the training of crew members in emergency duties and routines.
- Ensuring that their actions do not compromise the Health, Safety and Welfare of the vessel or crew on board.

Gun Mechanics

Are responsible for the safe deployment, recovery and maintenance of the gun arrays and wide tow paravane system onboard the Veritas Viking II. Gun Mechanics are responsible also for stock control on consumable items in their domain. They will train all new employees in the safety operation of the gun deck with the assistance of the Chief Mechanic and Operations Supervisor

The safety aspects of their duties include, but are not limited to the following:

- Ensuring those new employees have the correct amount of training prior to having them work unsupervised.
- Ensuring the Health, Safety and Welfare of personnel working under their direction with regards to back deck operations.
- Participating in emergency drills as required by the Master and directed by Officers of the vessel.
- Although not members of the Safety Committee, they have their own weekly safety checks to do and will submit these on a weekly basis to the safety committee.

Chief and Senior Technicians

Technicians are responsible for the maintenance of all electrical and electronic equipment, as required.

The safety aspects of their duties include, but are not limited to the following:

- Maintenance of the electrical and electronics aspects of the safety equipment.
- Active participation in emergency drills as required by the Master and training of personnel in the operation of electronic equipment associated with safety equipment.
- Ensuring the Health, Safety and Welfare of personnel under their direction with electrical/electronic equipment.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 55 of 182

Observers, Navigators, Processors, Trainees

Will assist in many areas onboard the vessel at the direction of their respective superiors. They must adhere to all safety guidelines as they move from one area of operation to the next. Their duties are varied, from assisting in the Recording Room to assisting on the Cable Deck and the Gun Deck.

When maintenance is required on the Streamer, they will ensure that all tools are at the ready and are in good operable working condition. When this work is completed, it is their responsibility to ensure this area of the vessel has been tidied and is prepared for future tasks.

These members of the crew have a responsibility to ensure that their actions or omissions do not cause injury to, or compromise the Health, Safety and Welfare of the vessel or other crew members

It is their duty to participate in emergency drills as required by the Master and directed by the Vessel Officers. They are to be acquainted with the location and operation of all fire fighting, lifesaving and other emergency equipment onboard.

Personal Safety

Every individual is responsible for his/her personal safety, and the safety of the people working with him/her. Each individual should ensure that all safety equipment is in place and properly maintained. No task should be performed with sub-standard equipment, or by improvising.

All VERITAS DGC employees and sub-contractors, or any other person will always observe the basic rules of Marine Safety onboard this vessel.

4.4 Employee Performance Appraisal & Development

Annually, employees will be appraised, by their respective Managers, on their performance. An integral part of this appraisal relates to the employee's understanding of their job and HSE awareness.

The appraisal of each employee is assessed on the following categories:

Personal

Managing The Assigned Task

Working With Subordinates

Working With Others

HSE

Performance

The appraiser and unit manager will then provide their comments, prior to the employee being able to review the appraisal and add his/her comments.

The final stage is establishing a development plan for each employee, assessing their job history over their last 4 assignments, and their career direction.

This system will assist Management in determining development of employees in all fields.

4.5 Right to Refuse

It is legislated throughout industry in various forms, that workers have the right to refuse to work on the grounds of un-safe conditions. Due to the complexities of nominating any one particular legislation in regards to this Veritas DGC, agrees with the following relevant statement as issued

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 56 of 182

by the Canadian Occupational Health and Safety Act.

“A worker may refuse to do work that the worker has reasonable grounds to believe is dangerous to his or her health or safety, or the health or safety of another person at the workplace.”

The following 3 step procedure applies:

Report immediately to his/her immediate supervisor giving the precise conditions for the refusal to work.

If the matter is resolved to the employee’s satisfaction he must return to work.

The unsafe condition must be reported via the completion of an Incident Report and follow up as per Veritas DGC Incident Reporting Procedures.

However, if the matter is not resolved to the employee’s satisfaction:

The employee reports to:

The HSE (VIMS) committee, or the site HSE (VIMS) representative for investigation, and also to the HSE department for information and follow up.

While the matter is under investigation Veritas DGC may assign the employee/contractor other work that is reasonably equivalent to his/her normal work without loss of wages or benefits. Irrespective of reassignment Veritas will continue to pay the employee/contractor the same wages or salary and grant the same benefits as the employee/contractor would have received had he/she continued to work.

Where an employee/contractor has exercised the right to refuse to work Veritas DGC shall not assign any other employee/contractor to perform his/her duties unless the substitute employee has been informed of the prior refusal and the reasons for that refusal.

If the matter is not resolved by the HSE Committee or employee/contractor representative:

The matter is investigated by an occupational health and safety inspector and advises the employee/contractor to return to work

Where an employee/contractor has exercised the right to refuse to work Veritas DGC shall not assign any other employee/contractor to perform his/her duties unless the substitute employee has been informed of the prior refusal and the reasons for that refusal.

Steps for Resolution to Unsafe Condition:

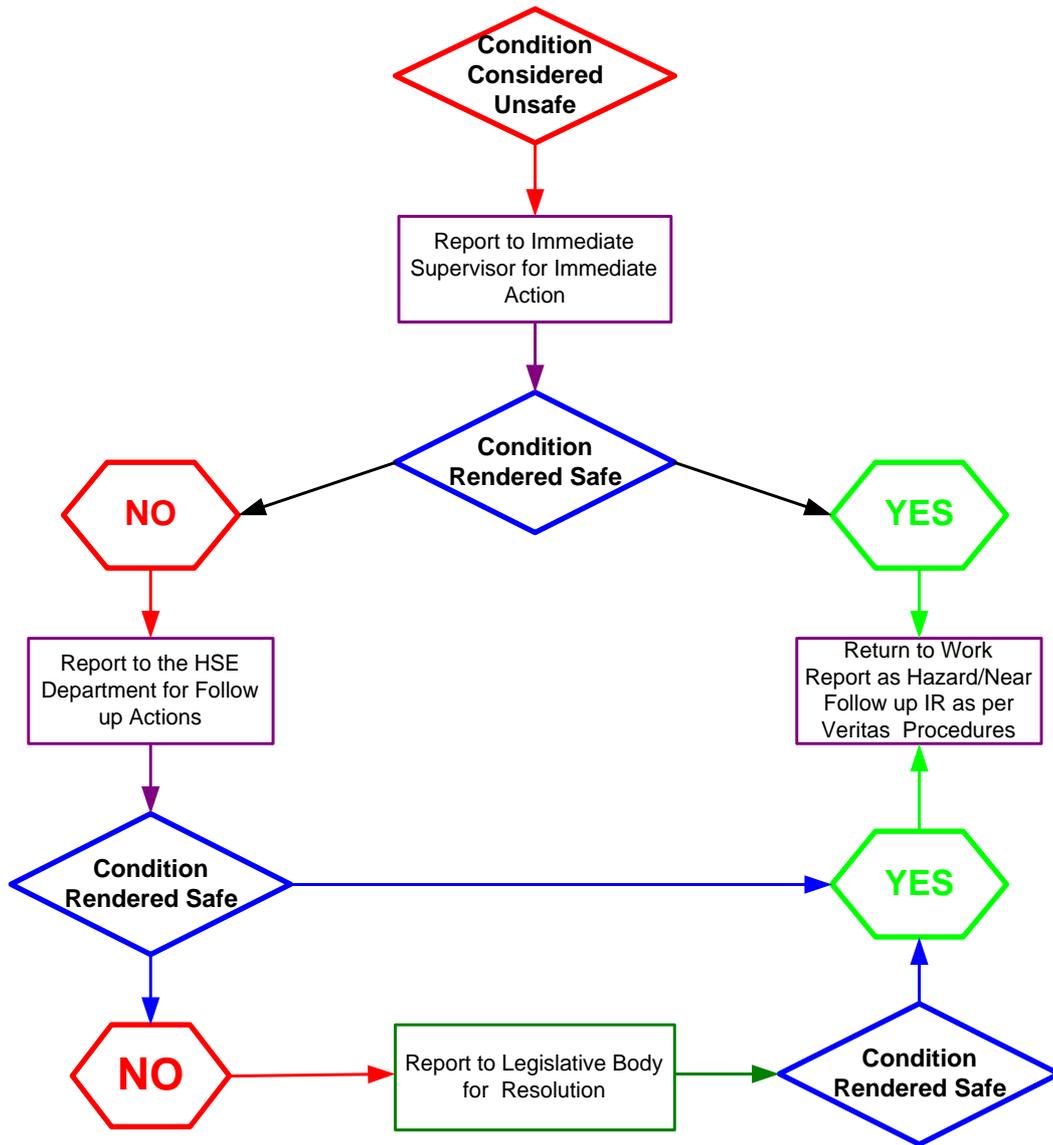

Figure 14 Steps for Resolution of Unsafe Condition

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: HSE Management Organization & Responsibility.		Page 58 of 182

4.6 Veritas/Eidesvik Safety Management System Interface

Introduction

The Veritas Viking II is a seismic research vessel chartered from Eidesvik by Veritas Geophysical. In the course of its normal operations there are several areas of activity and procedures that are critical for the safe operation of the vessel and the personnel assigned to the operation. Veritas and Eidesvik have documented these areas in their separate operational, management, and emergency plans.

Veritas' expertise lies in the acquisition of marine geophysical data through the use of multiple streamer, multiple source towed arrays. Eidesvik's expertise lies in the provision of the marine vessels utilized for marine geophysical surveys.

To this extent a separate document exists in all operational; centers of both Veritas and Eidesvik, as well as onboard the Veritas Viking II. The document is titled "*Veritas/Eidesvik HSE Interface*" and acts as the bridging document between the two companies HSE Management Systems. This interface will detail those areas where overlap or conflict in activities or procedures are possible, and provide direction for the vessel's personnel when encountering activities where overlap or conflict is possible.

Document: SR/V Veritas Viking Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Hazard/Risk Assessment.		Page 59 of 182

5.0 Hazard/Risk Assessment

5.1 Contents

Based on the guidelines of the E & P Forum and IAGC, Veritas DGC has formulated a Hazard/Risk Assessment Register for this vessel, the contents of which are listed below.

1 - AIRCRAFT

A-01 - Approaching Helicopters
A-02 - Rotors
A-03 - Adverse Weather

A-04 - Landing Area
A-05 - Security
A-06 - Passengers
A-07 - Medivac
A-08 - Personnel
A-09 - Noise

2 - COMPRESSOR

CM-01 - High Noise Levels
CM-02 - Fuel Spill Or Leak
CM-03 - Repair Of Hydraulic Pipes & Fittings
CM-04 - Hot Work - Use Of Cutting / Heating Equipment
CM-05 - Repair Of High Voltage Equipment
CM-06 - Repair Of Steelwork
CM-07 - Repair Of High Pressure Systems
CM-08 - Handling / Storage Of Compressor Oil
CM-09 - Operation Of High Pressure Compressors
CM-10 - Compressor Operation

3 - CRANE/HOIST

CR-01 - Crane Or Hoist Type / Suitability
CR-02 - Incompetent Operator
CR-03 - Unsafe Or Excessive Loading
CR-04 - Component Failure
CR-05 - Crane Operator Fitness

4 - ENERGY SOURCE

ES-01 - High Air Pressure Hazards
ES-02 - Deployment / Retrieval Of Guns
ES-03 - Lack Of Maintenance
ES-04 - Incompetent Sparker Operator
ES-05 - Incompetent Air Gun Operator

5 - HUMAN BEHAVIOR

HB-01 - Self Medication
HB-02 - Alcohol / Drugs
HB-03 - Fatigue
HB-04 - Disease
HB-05 - Fighting

HB-06 - Hygiene
HB-07 - Culture

6 - MISCELLANEOUS

7 - NAVIGATION

5.2 Description

Hazard Risk Assessment

Risk can be mitigated through the application of the Hierarchy of Control. The Hierarchy of Control is a ranked scheme, which shows the techniques to control risk and is an iterative, multilevel process. The hierarchy is listed in order below showing the most to least effective control technique;

1. Elimination
2. Substitution
3. Reduction
4. Isolation
5. Administration
6. PPE
7. Discipline.

One of the ways in which we can mitigate unacceptable risk levels is by applying a Standard Operating Procedure (SOP), and within the Operating Procedures we may also be applying the Hierarchy of Control.

Hazard - Risk Assessment and Mitigation

We need to assess the risk that the hazard poses both before and after control measures are applied. We want to do this to be able to demonstrate that we have significantly reduced the relative risk, ideally to ALARP or into the 'Tolerable' zone if possible. We want to use the Risk Score Calculator (RSC) to do this. We want to quantify this reduction rather than only use a subjective description or an alphanumeric code such as A2, B3, etc.

The variable components to calculate the Risk Score Calculator are Probability, Exposure and Consequence. For our initial risk assessment, to keep the process simple, we use a fourth term Likelihood which is the product of Probability and Exposure or $L = P \times E$. This approach has a number of distinct advantages:

1. It keeps our Risk Score Calculator concept intact and applicable;
2. It makes the initial risk assessment simple since we only have to consider two components, yet provides us with either a subjective or a numerical value for initial risk assessment;
3. It enables a 2D representation of a 6 by 6 matrix with Likelihood and Consequences as the ordinates (see Figure 15).

In our 2D, 6 by 6 matrix we need to consider Consequences, which impact in four areas of our business namely People, Environment, Assets and Reputation . The first three of these four areas are already included as Incident Reports in VIMS and keywords are available which provide semi-quantifiable descriptors matching the broad Consequences of Noticeable, Important, Serious, Very Serious, Disaster, and Catastrophe (which also align with the RSC).

On the matrix in Figure 15 there are numbers on both axes. These numbers can be used to generate a quantifiable risk score. For example; for a Likelihood with a Possible outcome the number is 25; combined with the Consequence of a Serious outcome the number is 5. The Risk

Score is $25 \times 5 = 125$ which equates to a Substantial Risk (Check the RSC tool, Figure 16 to verify that this is so).

Having arrived at a measure of our pre-control risk, the next step is to apply controls and then reassess. To do this we use the RSC by considering Probability, Exposure and Consequence and the interactive RSC tool. If we now see that our Probability is Remote, Exposure is reduced to Rare and Consequence remains at *Serious* we have reduced the risk to Low or a Risk Score of 7.4 (Figure 17).

Likelihood P x E

Certain	81	Substantial	High	High	Very High	Very High	Very High
Quite Likely	49	Substantial	Substantial	High	High	High	Very High
Probable	36	Substantial	Substantial	Substantial	High	High	High
Possible	25	Moderate	Moderate	Substantial	Substantial	Substantial	High
Unlikely	9	Moderate	Moderate	Moderate	Substantial	Substantial	Substantial
Improbable	4	Low	Moderate	Moderate	Moderate	Moderate	Moderate
		2	3	5	6	7	9
Consequence		Noticeable	Important	Serious	Very Serious	Disaster	Catastrophe
People		No Injury	FAC or MTC	RWC or LTI	PPD	Fatality	Multiple Fatality
Environment		No Damage	Some local environmental damage. Within the localized area and within the local system. Negligible financial damage	Some contamination. Damage sufficiently large to affect the environment. A single exceedance of a statutory or prescribed criterion. A single complaint. No permanent affect on the environment	Limited loss or discharge of known toxicity. Repeated exceedance of a statutory or prescribed limit. Affecting the neighborhood.	Severe environmental damage. Extensive action required to restore the contaminated area to its original state. Extended exceedance of a statutory or prescribed limits.	Persistent severe environmental damage or severe nuisance extending over a large area. Major economic loss. Consistent exceedance of a statutory or prescribed limit.
Asset		No Outcome	Slight disruption < \$1000.00	Minimal Disruption \$1000 to < \$5000	Partial loss of service hours. \$5000 to < \$20000	Operations restored within a day. \$20000 to < \$50000	Substantial or total loss. >\$50000
Reputation		No Impact, No Public awareness	Slight impact. Public awareness may exist, no public concern	Limited impact. Some public concern. Local media and/or local political attention	Considerable Impact. Regional public concern, adverse attention in local media. Slight national media attention.	National impact, adverse attention in national media	International impact extensive adverse international media with potential to impact new contracts or licenses.

Figure 15 VIMS Likelihood – Consequences Risk Matrix

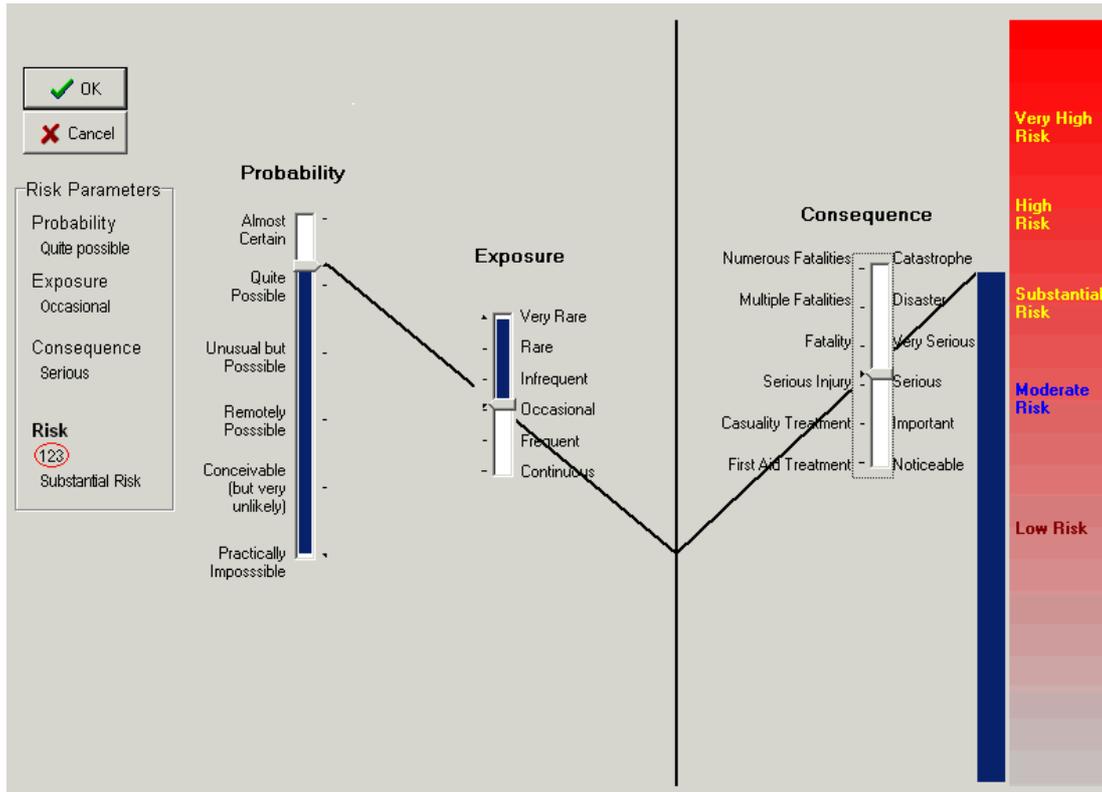

Figure 16 RSC showing Risk Score of 123 (Substantial Risk)

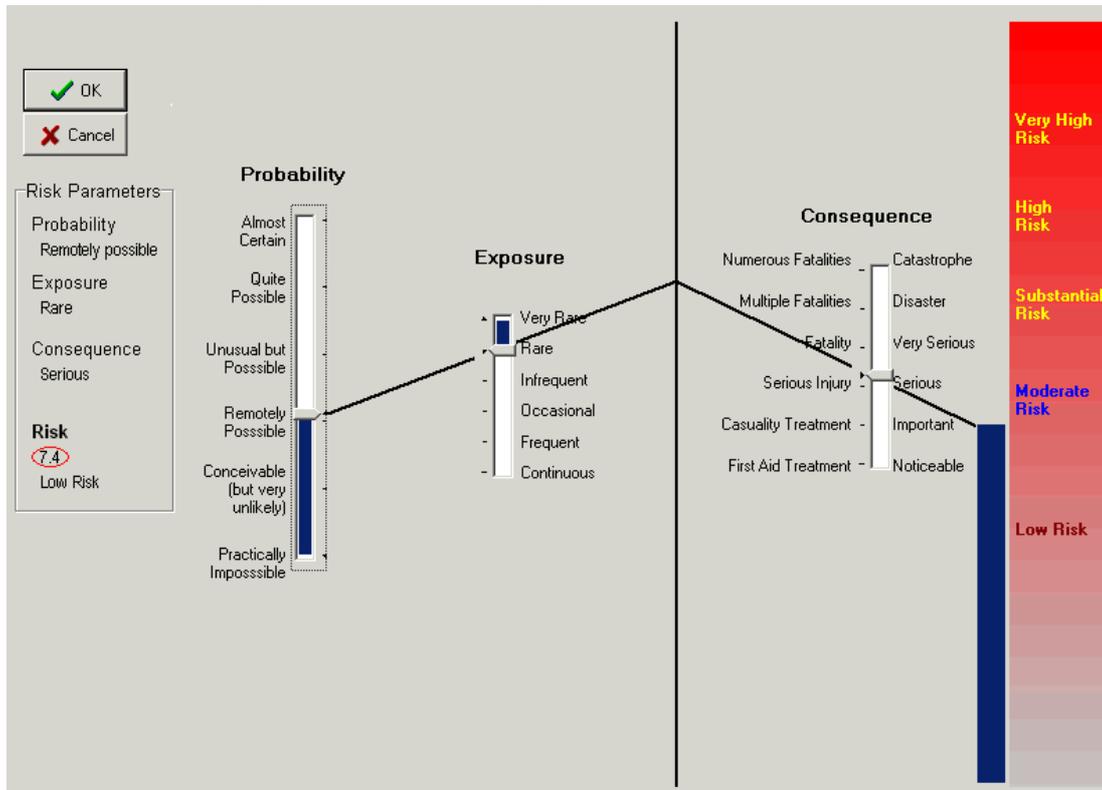

Figure 17 RSC showing Risk Score of 7.4 (Low Risk)

By using this method we can demonstrate in a semi quantifiable way the effectiveness or improvement gained in risk mitigation measures. This allows us to graphically display Risk Contours for Project hazards before and after mitigation as see in figures 18 and 19.

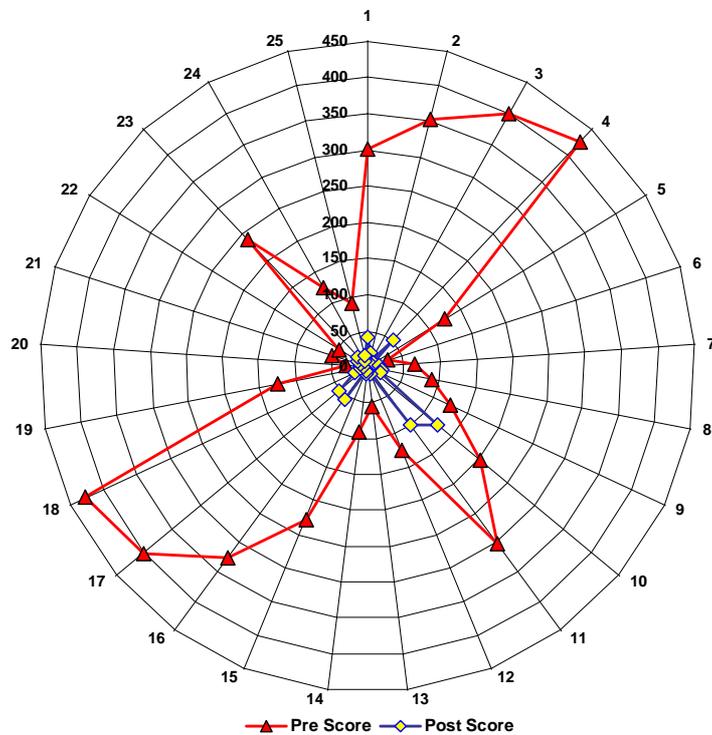

Figure 18 Risk Score profiling for 25 Hazards, pre and post control application

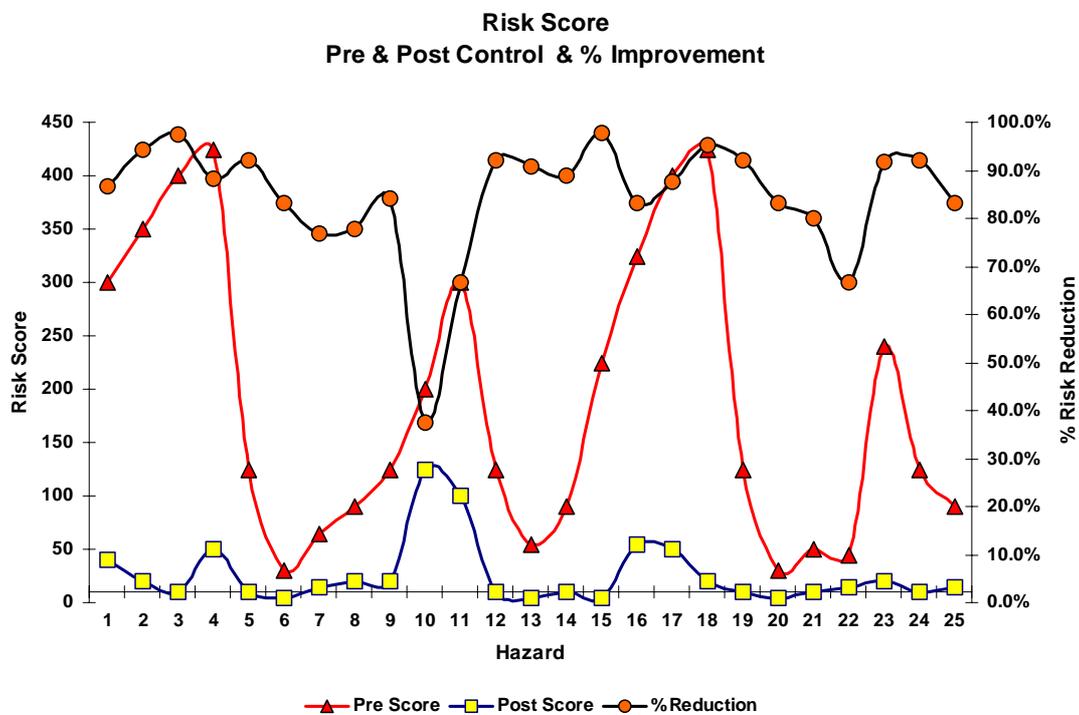

Figure 19 Risk Score profiling for 25 Hazards showing 'Pre-control' and 'Post-control' application and % Improvement.

Document: SR/V Veritas Viking Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Hazard/Risk Assessment.		Page 64 of 182

Note that the x-axis cuts the risk score axis at the 'Low Risk' score level of 10. Hazards with residual risk of > 10 may need further treatment.

By using this or similar techniques we can also plot the levels of relative risk and then look at hazards that need further treatment based on the risk score or sign off and accept the risk, as applicable.

Operating Procedures (Site Operating Procedures – SOP's)

1. 'Administration Related' (ADM) Operating Procedures:

The recommended method to complete documentation for an administrative process, e.g. filling out forms, processing information, managing events and submitting VIMS reports.

2. 'Equipment Related' (EQP) Operating Procedures:

A 'how to' set of procedures, e.g. Generator start up and shut down, vibrator pressure up, crane use, deploy streamers, retrieve gun array etc.

3. 'Activity Related' (ACT) Operating Procedures:

Those procedures associated with a particular activity, using the activities listed in VIMS. For example in Land - Administration, Camp, Drilling, Explosives, Helicopter. Line Clearing, Permitting, Recording, and Surveying.

4. 'Project Related' (PRO) Operating Procedures:

An operating procedure that mitigates or controls a particular project hazard.

5. 'Environment Related' (ENV) Operating Procedures:

A process to be followed to minimize impact or demonstrate due diligence in the physical environment.

Critical Operating Procedures

Procedures that control significant risks and involve a number of people work groups with significant staff turnover or otherwise require higher levels of management attention to assure the required level of compliance. Typical field acquisition sites identify 20-30 Critical Procedures dependent on the nature of their operations and associated hazards. Lower risk sites, such as offices, may only identify 10 Critical Procedures.

Regular Operating Procedures

Procedures for which a lower level of management attention is needed to achieve the required level of assurance. Regular Procedures typically involve a smaller number of people and/or involve a lower level of risk.

Reference Procedures

Procedures, which describe functions, which do not apply or are not, required, for normal operation.

SOP Structure

When is an Operating Procedure required?

Most tasks and activities can have procedures written for them, in reality many routine activities do not. If procedures were produced for every activity or task, the system would rapidly become unworkable and hopelessly inefficient by the sheer volume of information recorded. The questions to ask to determine when a procedure is necessary are:

- a) Has an incident already occurred, that indicates (through root cause analysis), the necessity for a written procedure? Would a written procedure have prevented or mitigated the loss experienced?

Document: SR/V Veritas Viking Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Hazard/Risk Assessment.		Page 65 of 182

- b) Is the task or activity so complex that each process step needs to be recorded to avoid errors of omission?
- c) Are the potential consequences of not having a procedure severe?
- d) Is organizational 'memory' of tasks or activities under-developed or likely to be discontinuous [through staff turn over or rapid changes in positions]?
- e) Do specific (safety critical) tasks need to be assigned to an individual to ensure that they are carried out [on a regular (monthly, quarterly, annual) time frame basis]?

The SOP's should be simple in format as follows:

1.0 SCOPE

WHY - Scope of SOP – Why is the SOP required, outline the intent/goal of the SOP

WHERE - To what site / facility does the SOP apply?

2.0 OBJECTIVES

WHAT are the ultimate goals of the procedure?

3.0 RESPONSIBILITIES

WHO is responsible for the actions, who does the SOP apply to?

4.0 PROCEDURES

WHEN will the SOP be carried out? How often? After any particular event?

WHAT is the procedure to be followed? List of the steps to be taken (This is the body of the document)

5.0 METRICS

HOW will the activities be verified as completed? Where will data be recorded? Records?

6.0 REFERENCE

TO WHAT Management Procedure and to what Hazard does this SOP attach? Is there any other information needed or required regarding local statutes, special requirements or references?

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 66 of 182

6.0 Emergency Procedures

6.1 Personnel Duties During Emergency

MASTER

EMERGENCY (FIRE / FLOOD / FIRST AID, etc.)

Take command of the vessel from the Officer Of The Watch. Maintain a position on the Bridge as leader of the Bridge Squad, and in overall charge of the emergency and co-ordinates all activities according to his judgment of the total situation.

The master is assisted in his role by the Chief Officer, whose combined roles is to ensure all crew have mustered at their designated muster stations:

Emergency Response Teams

Engine Room Response Team

General Muster Personnel

Ensure fire pumps are started.

In the event CO² is to be released in any compartment, the Master along with the Chief Engineer are to ensure that all vent flaps/hatches/openings to the compartment are secured and all personnel are accounted for prior to release.

ABANDON SHIP

In the event of an **ABANDON SHIP**, he is the only person who is to issue the command to Abandon ship. This command will be a verbal announcement to the crew.

The Master will issue the emergency messages and notification to be dispatched, call for any outside assistance or abandon the vessel.

Record ships position.

Activate **EPIRBS** if necessary.

Direct Spare personnel to gather up spare blankets, water, and medication if there is time.

CHIEF OFFICER

In charge at the scene of the emergency. Keeping Bridge informed of the situation and liaison with Response team leader and 1st Officer on VHF.

Take command of the vessel should the Master become incapacitated or unable to tend to wheelhouse requirements.

Ensure the Medical Cabinets and Hospital are open, and where critical drugs are required, ensure the correct quantities are given, etc.

1st MATE

Remains on bridge to assist Captain as directed.

AB'S, COOKS, & STEWARDS

Upon hearing the emergency alarm, the Off-Shift Abs' are to proceed directly to the General Muster area and stand-by to be directed by the Mate. The Cooks & Steward are to check all accommodation then proceed to the muster station & administer first aid if necessary.

The On Shift AB has the role of Smoke Diver on the initial Attack Team and is to muster accordingly and commence donning the appropriate equipment from the Fireman Locker, or as directed by the Chief Officer.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 67 of 182

In general the Cooks and Steward are more than conversed in first aid procedures and will be utilized where practical to conduct first aid support in the event it is required.

CHIEF ENGINEER, 1st & 2nd ENGINEER'S

On duty Engineer & Chief Engineer to stay in Engine Room & report to the bridge.

In the event of an Engine room fire the Engine Room staff are to muster at the Engine Room entrance fully kited up in Fire Suits, BA's Flashlights, and life-line (optional), or maintain assistance to the Smoke Diver. They are to enter the Engine Room spaces in pairs only and evaluate the situation.

Fuel and ventilation can be remotely shut-down by operating the shutdown switches on the main engine room panel or the emergency shut down on the bridge & levers and flaps at various outer locations around the ship.

The Fire Attack Team will back up the Engine Room Staff under the control of the Chief Engineer. Once again at least pairs are only to enter with the Bridge Staff being kept informed of the situation.

CO² ACTIVATION

If the CO² Extinguishing system is required to be used, then the Order to activate the system can only be given by the Chief Engineer in conjunction with the Master.

This can only occur if it is certain that there are no personnel in the compartment to be flooded with CO² and that all vent flaps, hatches, and air intake vents have been fully secured.

The Bridge has a checklist that has to be strictly adhered to in the event the CO² system is to be utilized.

EMERGENCY ATTACK TEAMS:

List of personnel assigned to EMERGENCY RESPONSE TEAMS or ATTACK TEAMS are posted around the vessel and are subject to change based on personnel being trained in a particular task, but would be typically as follows:

Muster Point	Fire Fighting AM	Fire Fighting PM	Assist Team
Leader	Ch. Officer	1st Engineer	Veritas
Smoke Diver	Eidesvik AB	Eidesvik 2nd Engineer	Veritas
Smoke Diver Asst.	Eidesvik AB	Veritas	Veritas
Assistant	Eidesvik AB	Veritas	Veritas

Muster Point	Engine Room Squad	Technical/First-Aid	Bridge Squad
	Engine Room	Hospital/Bridge	Bridge
Leader	Ch Engineer	Electrician/Ch Stew	Master
Fire Chief		Veritas	Party Manager
Fire Chief Asst.		Veritas	First Officer

All other personnel MUSTER AT MUSTER STATION with life jacket & survival suit

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 68 of 182

PARTY MANAGER

Upon hearing the Emergency alarm, proceed directly to the Bridge and report that you have mustered.

Evaluate the situation along with the Master, advising where required. Assist the Master as instructed.

Should the situation be non-serious or under control, he should dispatch crew to monitor the Back Deck and in-water equipment.

SEISMIC PERSONNEL

Upon hearing the Emergency Alarm proceed directly to the Muster Point and await instruction. Personnel assigned to the Attack Teams should prepare necessary equipment.

6.2 Project HSE Plans

Due to the diverse range of personnel, roles, companies, clients and agents that may be present on these vessels, it is necessary to ensure that all personnel are aware of operational and emergency procedures.

Veritas Marine Acquisition, as operator of the Veritas Viking II, maintains the safe control of all geophysical activities onboard and assists the owners with the operation of the vessel, within the boundaries of the respective governing authorities or industry standards. At all times, all personnel, agents, sub-contractors and the like are required to perform their roles in a safe, efficient and responsible manner, and within the guidelines of this manual and the policy's and procedures contained within it. Policies and guidelines provided by other companies, agents or sub-contractors may be used as a guide.

Occasions will arise where a Project Specific HSE Plan is produced to give all personnel clear and concise guidelines as to the procedures they are expected to follow while engaged on a particular operation.

A Project Specific HSE Plan is produced as a result of input received from various parties, companies or organizations involved in any one project or operation having realized that integration of policies, a pooling of resources or a clear statement is required to clarify proceedings.

The Project Specific HSE Plan is produced for each project performed by this vessel. This Plan is specifically designed to give personnel information on, but not limited to:

- Area of operations, environmental conditions and hazards
- Policy
- Emergency contacts and reporting
- Local conditions
- Severe weather
- Casualty evacuation and resources
- Environmental management
- Supplementary information or manuals
- This manual should be the first point of reference during and emergency, along with the Crisis Management Plan.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 69 of 182

6.3 Crisis Management

Crisis Management

Consult the Veritas DGC Crisis Management Plan as soon as a situation develops. All employees are encouraged to read the Plan and consult this plan, together with the Project Safety Plan, FIRST when any crisis arises. The following is the "Purpose Statement" from the Plan.

The Crisis management plan has been developed to enable Veritas DGC (the "Company") to establish and maintain the capability to quickly and effectively respond to all aspects of any serious incident involving any Company employee, contractor, subcontractor, client, or other person on Company owned or operated facilities, or involving the production, distribution, or use of Veritas DGC's products or services.

The Plan has been distributed to all Veritas DGC personnel who act in a supervisory position. These personnel will, at least annually, review the Plan with all employees under their supervision and will post a copy in each facility under their control. In addition, a copy of the Plan is to be provided to each client and subcontractor of the Company at the beginning of any contract for seismic data acquisition or other field activity.

This Plan is specifically designed to give personnel information on, but not limited to:

- Initial disaster response guidelines
- Crisis management teams
- Crisis management by function
- Classifying the crisis for proper response
- Response plans for specific disasters
- Notification tree

6.4 Abandon Ship

General

All personnel are required to be familiar with their emergency station, duties, and Muster Area before an emergency arises. Each crew member will be required to sign the acknowledgment form shortly after completing the safety tour after arrival on the vessel. The emergency duties are described on the Emergency Plan/Muster list located on each deck. A more detailed description of the emergency duties can be found posted on the bulletin board outside the galley. A diagram of the vessel showing the location of the cabin relative to the vessel is posted in each cabin. This diagram shows the exits with the quickest route highlighted. It is the responsibility of each individual to learn all possible escape routes from their cabins and work areas.

Unless assigned to an Attack Team or specific emergency role, all personnel are required to report to the Muster Area and await orders. Crew members have more involved roles in an emergency, and must become proficient with the duties assigned to them.

Proper dress is an important PPE factor when reporting for any emergency, all personnel are trained in sea survival and must have the following: Coveralls, or Long Pants, Long Sleeve Shirt, as well as Safety Shoes or Boots, and a Hat available for use in an actual emergency.

Alarms

The alarm signals are different for each emergency. All personnel will familiarize themselves with the alarm signals, and the required response to each. During drills the general alarm is used along with an announcement over the P.A. system regarding what type of emergency situation is being

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 70 of 182

drilled. The reason for this is the Fire Alarm system onboard automatically shuts down all vents in the engine room and other areas on the vessel.

- Abandon Ship** Continuous ringing of general alarm, followed by 7 Short rings followed by 1 Long ring of the general alarm (repeated by vessel horn and/or whistle).
- Fire** Intermittent ringing of the general alarm, followed by announcement over ships PA
- Man Overboard** Continuous ringing of the siren alarm, (a distinctively different tone), followed by announcement over ships PA.

The Master has overall responsibility for ordering an abandonment of the ship, based on his judgment of how the given situation is expected to develop He will issue the necessary emergency distress messages and notifications. It is vital for future survival that the distress messages are acknowledged prior to abandonment. The distress messages should contain, as a minimum, the following information: -

- a) Name and Call Sign of vessel.
- b) Position.
- c) Weather conditions.
- d) Lifesaving equipment available to be used.
- e) Number of persons.

In a situation where it is evident that the ship will have to be abandoned, but time is available, then preparations and precautions can be undertaken, to better prepare the crew in a survival situation and to aid the rescue effort. Gather and distribute additional survival equipment and supplies, ensuring that radios, signal equipment, first aid boxes, ropes etc. are ready for the survival craft and life rafts. At all times personnel should be encouraged and reassured to prevent any panic.

6.5 Fire

General

Similar to the abandon ship procedure, all personnel are required to read the Emergency Plan and be familiar with their emergency station and duties during a fire emergency.

The Master has the responsibility of coordinating all activities according to his judgment of the total situation. The Chief Officer who is responsible for coordinating the fire teams and other activities during the emergency assists him in this role. The Chief Engineer is responsible for fire fighting in the machinery spaces.

General Precautions

When a fire is detected, no matter how small, or there is a suspicion of a fire somewhere on the ship, it is the responsibility of all personnel to:

- a) Activate the Fire Alarm.
- b) Try to extinguish the fire with available equipment, until fire team arrives.
- c) Try to seal off all openings feeding air to the fire.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 71 of 182

- d) Try to seal off openings that may be allowing smoke to enter other areas of the ship.
- e) Search for, and rescue people that may be trapped or overcome by the smoke.
- f) Once assistance arrives, either proceed to the muster point, or pass word of the situation and persons involved.

The Veritas Viking II is equipped with numerous fire fighting devices and fixed extinguisher systems. The fixed systems are primarily the CO² systems fitted in the machinery spaces and

Galley, along with a foam deluge system fitted over the Streamer reels. These systems are designed to adequately tackle a blaze in these areas. Personnel working in and around these areas should make themselves aware of the operation of these systems and be prepared to use them in the event of a serious fire.

The foam deluge system operates in conjunction with the main fire pump. When activated, the foam solution is injected into the water feed and expelled through the series of nozzles located over the streamer reels and associated decks. The foam is designed to blanket the area effectively smothering the area and extinguishing the fire. Once the foam solution is exhausted, water will continue to deluge from the nozzles, aiding in the cooling of the area.

CO² systems are agents designed to eliminate the oxygen from the area thereby extinguishing the flames. Because of its properties, CO² release must only be performed when the space is cleared of personnel and sealed, as it would be fatal to any person remaining in the area without correct breathing apparatus. The CO² release system contains a delay of 25 seconds. Once the system is activated, all ventilation systems are automatically shut down, and a siren sounds to indicate that the gas will be imminently discharged. The gas is pumped into the space through a series of nozzles, filling the space, from bottom to top. The area should be adequately vented prior to re-entry into the space.

When a fire is detected, the Master should assess the situation based on his own and the observations of the Chief Officer, and consider the possible developments of the fire and the possibilities of getting it under control. The Master, based on his evaluation, should:

- 1) Turn the ship on a course that will bring the location of the fire to leeward, to facilitate fire ventilation fire fighting from the windward side
- 2) Unless the fire is insignificant, the master will send an urgency message with information about the situation and what actions are intended, and if there are doubts that the crew will be able to contain or control the fire, the a distress message will be sent containing the following :
 - a) Name and Call Sign of vessel.
 - b) Position.
 - c) Weather conditions.
 - d) Assessment of the situation.
 - e) Lifesaving equipment available to be used.
 - f) Number of persons.
- 3) If there are substances within or in the vicinity of the fire location, that may emit toxic gases, the Master should direct the crew to a safe place and organize the fire fighting, with full protection, from this area. The master should consider possibilities of explosion or imminent danger of the crew being isolated from the rescue craft, when making this decision.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 72 of 182

- 4) A distress message will be sent if it is apparent from the muster that persons are discovered to be missing, or seriously injured. The distress message should request assistance to search the area.

6.6 Emergency Medical Evacuation

Introduction

The I.S.O.S. Maritime Services manual entitled *Medical Protocol Handbook*, and Veritas DGC's manuals entitled *Veritas DGC Crisis Management Procedure* and *Project Specific HSE Plan* should be consulted before implementation of the following Medivac procedures. These manuals describe the situations that require Medivac, and detail events leading up to the following procedures.

This procedure gives a general outline guide for Medivac of injured personnel to shore. The guide will list the necessary steps for a successful Medivac in general terms. Reference the Project Specific HSE Plan as this procedure is tailored to the area of operations, and will include the exact transportation available, and the steps required to execute immediate action. Additionally, the procedure may include the shore facilities available, and what injuries these facilities are unable to attend; requiring evacuation from the area, or country, of operation. As such, this procedure will require frequent review and update. The majority of this procedure is provided, by the supervisor, before the start of operations in a new area.

The following incorporates recommendations contained in the "*Notices to Mariners*" of a number of countries, and also the IMO Search and Rescue Manual (IMOSAR). The recommendations contained here should be regarded as supplementary to those previously established for your vessel.

General Guideline for Medivac for Illness or Injury

In cases of illness or injury when it is necessary to arrange for the evacuation of personnel via helicopter the following points should be noted.

Requesting Assistance

When requesting helicopter assistance the Master should:

- Determine and arrange a rendezvous position as soon as possible.
- Confirm the ship is inside helicopter range or if a diversion is necessary.
- Compute and confirm the ships ETA to the rendezvous point.
- Give as much medical information as possible, especially concerning the patient's mobility.
- Advise immediately of any changes in the condition of the patient.
- Confirm environmental conditions, i.e. wind speed and direction, sea conditions, visibility, cloud cover and height.

Preparation of the Patient

Before the helicopter arrives steps should be taken to:

- Move the patient as close to the heliport area as his/her condition permits.
- Ensure the patient is tagged to show details of any medication that has been administered.
- Prepare the patients' seaman papers, passport, medical record and other necessary documents in a package ready for transfer with the patient.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 73 of 182

- Prepare a small “overnight” bag containing the patient's personal toiletries; i.e.: toothbrush, comb, razor, etc.

Ensure that designated personnel are positioned and prepared to transfer the patient to a helicopter lowered stretcher if required. The patient should be strapped in face up with a life jacket and survival suit, if his/her condition permits.

Communications

General

The success of any transfer of personnel at sea depends on establishing and maintaining good communications. This applies not only to the communications between the helicopter and the ship, but also messages passed between each ship owner, operator, or agent and the helicopter operators.

Communication during the operation itself should be directly between the helicopter and the ship and not relayed through a third party.

To avoid any misunderstandings, especially if the language in use is foreign to any involved party, speak slowly and clearly to ensure all essential information is understood.

Use the best communications equipment available to ensure successful relay of all vital information; i.e.: VHF, SSB, Cellular, Inmarsat, or local FM.

The Medivac message should be sent in the order given, and repeated back by the helicopter, ship operator, or local contact. The operator must confirm the rendezvous position is suitable; if not, the Master must be notified and a new rendezvous position chosen agreeable to both parties. In the event a third party transfers the Medivac message, or confirmation, between ship to helicopter; it is essential the identical format, style, and content of the message remain unchanged.

Message Format

It is recommended that the format, style, and content of messages be based on the following example; also consult the SOS Medical Protocol Handbook:

- Vessel Name
- Vessel Call Sign
- Caller/Title
- Local Owner/Operator management with contact numbers
- Present Location-Latitude/Longitude
- Course/Speed
- Radio frequencies actively monitored. Include aircraft frequencies, if available.
- Rendezvous Position-Latitude/Longitude
- ETA to Rendezvous Position
- Number of personnel to Embark/Disembark
- Local Weather and Sea Conditions. Include relevant advisories.
- Any other relevant information.

6.7 First Aid Case Management

INTRODUCTION

Purpose

To provide instructions on the Duties and Responsibilities for Medics operating onboard vessels within the Asia Pacific division. The details provided below will allow each individual to understand his or her position and reporting responsibilities.

1.2. Organisation

The Marine Acquisition department for the Asia Pacific Region operates three Seismic Vessels, the R/V Veritas Searcher and M/V Pacific Sword and the SR/V Veritas Viking II (hereinafter referred to as the **vessel**). The glossary listed below in section 2.0 details the Management team within the Asia Pacific Region.

Glossary Of Abbreviations

Hereinafter is a list of position mandate abbreviations that are found in this document.

RMM	Regional Marine Manager
SUP	Vessel Supervisor
RIS	Regional Instrumentation Supervisor
RMS	Regional Marine Superintendent
HSE	QHSES Coordinator
RLS	Regional Logistics Supervisor
MAS	Marine Administration Supervisor
PM	Vessel Party Manager
OS	Operations Supervisor
VM	Vessel Master (Captain)

Onboard Medic Duties And Responsibilities

Medic's Daily Duties

Daily responsibilities include but are not limited to;

- Periodic inspection of medical cabinets and medical O₂ usage logs for verification of stocks and volume remaining. Expiry dates should be listed and monitored to ensure fresh stocks are ordered as required.
- Distribution of basic medications (Other Than "S4" Drugs) as required.
- Onboard tuition on basic or advanced first-aid techniques.
- Reporting to the **VM** and or **PM** on a daily basis,
- Weekly Inventories and reports on medical supplies. Full report submitted to the **PM** for vessel weekly reports.
- Daily inspection of ablutions, showers and food preparation areas, to ensure high levels of hygiene.
- Correlation of medical supplies for requisition. Submit to **PM** two weeks before any port calls.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 75 of 182

- Full and comprehensive hand over report for relief Medic, report submitted to the **VM** and **PM** before departure from the vessel.
- Monthly Report to **HSE** before the second day of the new month.

Medical Supplies

Notwithstanding the Medic's responsibilities for medical supplies as detailed above, the **VM** and **PM** are responsible for the inventory level of marine & seismic equipment and stock levels. By following the duties listed above the Medic will provide the information required by **VM** and **PM** to submit requisitions for replenishment of used or expired medical supplies. A well-planned inventory level will ensure that there is ample stock for no less than a nominal work swing (6 weeks +/-1 week).

Onboard Case Management (First Aid)

In the event that first aid is required, it is of great importance that a comprehensive Case Management procedure outlines the reporting and follow-up requirements. The overriding objective is to ensure all first aid treatment cases remain exactly that. With the onboard medic taking a pro-active approach to all first aid cases, will assist in avoiding any unnecessary complication.

Case Management Reporting and Follow-up

The bullet points raised below clearly define the onboard medic responsibilities for each individual first aid case. The onboard medic to submit follow-up reports (Electronically) to the **PM** and **VM** twice daily. Continue with this routine until such time, all parties are 100% satisfied that no further first aid is required. The **PM** or **VM** will submit the reports twice daily, within the comments section of the initial incident report.

- Provide details on prescribed medication
- Highlight all recommendations for further treatment during the early stages.
- List medical supplies utilized, e.g. Ointments, Bandages and Antiseptics.
- Detail the mobility of the patient. E.g. Bedridden, restricted duties, full mobility.
- Details of correspondence with International SOS

First Aid Treatment Case Definition

Treatment of a defined nature whether performed by a Medical professional or para-professional. The following are generally not considered as recordable occupational injuries unless the occupational injury involves loss of consciousness, restriction of work or motion or transfer to another job

6.8 Man Overboard

Seismic Crew

This section is intended as a guideline, and to help focus efforts in the event of a man overboard. Every emergency has its own unique set of circumstances; procedures will therefore be modified as the situation dictates.

Hail the words "**Man Overboard**", and notify the bridge immediately. Launch the MOB life raft and life rings/smoke floats. If you haven't already activated the "Emergency Stop/MOB Alarm" for the guns then the Recording Room will do so upon hearing the alarm. Do not leave your post unless essential. Pass the word through others and post all available lookouts

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 76 of 182

It is essential that visual contact is maintained with the subject as long as possible. NEVER jump from the vessel into the water to attempt rescue, one person is easier to rescue than two.

Upon notification of the bridge the officer in charge will sound the appropriate man overboard alarm: continuous ringing of the ships' general alarm bell. The Master, Party Manager will then be immediately notified and appraised of the situation.

Chase boat and other traffic in the area to be immediately notified, as first response, other vessels to post lookouts and standby to respond.

The Observer on watch will immediately terminate the line and start appropriate recovery of overboard equipment.

Navigators obtain an immediate position fix and make that position known to the Bridge. Stand by at the Navigation station take additional fixes as required, especially changes in course or speed. Plot positions as soon as fixed.

Prepare FRC for launch, and equip with additional blankets and first aid supplies for treatment of hypothermia or shock.

Assigned personnel muster immediately to their man overboard-emergency stations.

Launch Fast Rescue Craft – **Under Master's directive.**

All others not directly involved in the rescue operation **Stand Clear.** Go to lookout points on the Helideck and Topside levels. Await instructions.

Launching the MOB Life Raft

The six-man capacity, Man-Over-Board, emergency life raft is mounted on the stern and can be deployed from the Streamer Deck or Gun Deck. The Painter is attached directly to the life raft cradle.

The raft is released from one of the two release stations, Streamer Deck or Gun Deck, by pulling the wire, allowing the raft to free-fall out of its cradle.

The action of the raft falling will automatically inflate the raft, then release the painter line at the quick release hook, and allow the raft to float free from the vessel.

Bridge Crew

Duty Officer on Bridge sounds alarm. Call Master and Party Manager. Release smoke and light float.

A.B. on watch release smoke and light float.

Alert other vessels via radio, and instruct chase vessel to proceed immediately to the known location.

Designated spotters to proceed to Bridge.

Assigned personnel muster immediately to their man overboard emergency stations.

Launch Fast Rescue Craft – **Under Master's Directive.** For launch procedures see section “Small Boat Operations”

6.9 Boarding or Disruption by Activists

Boarding or Disruption of Operations by Environmental Activists

This procedure is for the rare occurrence of interference of operations, or in case of actual vessel boarding by environmental activists. Consult the Veritas DGC Crisis Management Plan as soon as possible.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 77 of 182

If any of the vessels associated with the seismic operations are approached or boarded by uninvited representatives of action groups, the following guidelines should be applied. Specific statements to be read out are included.

Minimize any opportunities, which if photographed may offer the possibility of sensationalizing the situation. Media teams may accompany any boarding party. Do not give any interviews.

The key is for everyone on the vessel to be non-confrontational and to deal with such an incident in a professional, firm and moderate manner.

These guidelines should be passed down to support vessel masters in the event of such a situation developing.

Pre-Boarding

If you become aware of another ship approaching the vessel or the towed cables, the normal rules of the sea apply. Collisions at sea are to be avoided if at all possible. The appropriate signals during maneuvering should be given. Any maneuvers etc. should not be made which would endanger the safety of your vessel or of the other craft. Safety of your ship, crew and any other craft and their passengers should be your overriding concern. However, rapid changes in course provide high risk to personnel onboard in entangling the towed equipment with the vessel's propellers. There may therefore be times when collision with inflatables or persons in the water becomes unavoidable. Should this be the case the vessel's FRC's should be deployed to assist with rescue efforts following the incident. It is important that a log is kept of all observations and steps taken.

If you come into contact with potential illegal boarder(s) and it is possible to communicate by radio, telex or load hailer, Statement 'A' must be read to them

Attempts to Board

No assistance should be given to aid illegal boarder onto the ship. However, attempts to board should not be resisted, unless it is clear that in doing so, no person's safety (including that of the illegal boarders) is endangered. All accesses to the vessel's accommodation should be locked. Attempts to gain entry to the vessel's cable and deck should be strongly resisted since such areas contain numerous hazards for those not briefed on the functions of the equipment.

On Boarding

If an illegal boarder succeeds in boarding the vessel, statement 'B' must be read to him/her. The illegal boarder should then be asked to leave the ship unless it is dangerous for him/her to do so. If he/she does not, or cannot leave the vessel he/she may be restrained if:

His/her conduct appears to threaten the safety of the vessel, the crew or any other party.

His/her conduct is contrary to the preservation of good order or discipline onboard the ship.

Therefore if, for example, the illegal boarder attempts to chain himself/herself to a piece of machinery necessary for the operation of the ship, or if he/she proceeds to try to threaten the crew with physical harm, he/she may be restrained, statement 'C' must be read to him/her. There can be no restraint until his/her conduct falls under either category above. At all times the crew should remember that compromising photographs/video photography may be made of the events when restraining boarders. Only such force as is reasonably necessary can be used. If an illegal boarder does not resist restraint, no force is therefore necessary. Causing pain/bruising to an illegal boarder may be criminal assault, unless it can be shown to be necessary to promote safety, good order, and or discipline. This may mean, for example, that

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 78 of 182

holding a person's arm behind their back and causing them pain is unnecessary and, therefore, illegal.

Once restrained, the illegal boarders may be placed in locked premises.

Areas such as the bridge, engine room and accommodation should be locked to deter boarders from entering. If any illegal boarder attempts to force entry, he may be restrained (in accordance with the above) Statement 'C' must be read to him/her. All accesses to the vessel's accommodation should be locked. Attempts to gain entry to the vessel's cable and gun deck's should be strongly resisted since such areas contain numerous hazards for those not briefed on the functions of the equipment.

An illegal boarder may be restrained until reasonably practicable to have him/her put ashore. This may mean that the illegal boarder may be handed over to the police, if the police so request, prior to him/her being put ashore. If you are restraining any person, you should inform the police and the Veritas DGC Shore Supervisor.

Statements

STATEMENT 'A'

I do not authorize you to board this vessel and any attempt to do so is an illegal action. Moreover, it would interference with navigation and a potential hazard to the safety of the ship and her crew as well as those making the attempt. Such reckless and potentially dangerous behavior is unseamanlike and completely contrary to the rules of the sea.

Anyone who boards this vessel will be asked to leave immediately, if they do not do so I reserve the right to take action as considered necessary for the protection of the vessel and her crew. Such action could include the searching and detaining of personnel until they can be placed in the hands of the appropriate authorities at the next port of call.

STATEMENT 'B'

I am authorized by the master of the ship to inform you that you are not authorized to be present onboard this ship. You must leave this ship. If you do remain onboard, you will be committing an offense under Maritime Law. I am formally requesting you to leave this ship immediately.

STATEMENT 'C'

I am authorized by the master of this ship to put you under restraint if and for so long as it appears to the master necessary or expedient. This is (either/both)

1. In the interests for the safety of the ship, it's crew and/or your safety.
2. In order to preserve good order or discipline aboard this ship.
3. This power of the master of the ship is exercised under Maritime Law.

Notification Procedures and Actions

Introduction

In the event of a Pressure Group attempting to interfere with vessels' activities, the Master will use Emergency Reporting Procedures to mobilize the appropriate Emergency Response.

If the vessel master considers safety or the environmental standards may be compromised at any stage then operations should be suspended, and facilities made safe.

Veritas DGC standard reporting procedures will be followed.

Special actions including mobilizing a senior manager to site as a matter of urgency may be

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 79 of 182

necessary, as well as proceeding with Government and Public Affairs activities aimed at staff and key opinion formers and keeping authorities and clients fully informed.

The local police, Coast Guard and relevant authorities must be notified.

Actions Offshore

The strategy for dealing with initial disruption should be:

HSE compliance is paramount, therefore halt all activities to prevent risk of injury.

People to be treated firmly but with respect - *aggressive action should not be taken.*

At all times personnel should try and avoid presenting photo opportunities.

The over-riding objective is to minimize negative publicity and disruption to our operations

Proposed Media Holding Statement - For Senior Manager's only. No statement to be given by anyone else.

This type of statement can be used in case of a direct approach from the media.

"We are aware of {activist organization} action in the {area of operations}. Our immediate concern is to ensure the safety of our own and {activist organization} personnel. Let me assure you that

Veritas DGC are taking all reasonable steps to ensure people's safety and we would urge {activist organization} not to do anything that could jeopardize safe operations. Beyond that, we have no further information. For further information we suggest you call our headquarters in Houston.

Evidence Gathering

Always remember that in order to satisfy any criminal or civil court, it will be necessary to establish "Who did what to whom - when, where and how"

Best evidence will comprise corroborated eyewitness statements or the evidence of one eyewitness supported by other corroborative evidence such as video recording, taped conversations etc.

Scenario planning should have identified equipment and personnel essential to the good management of an incident. This will involve making sure adequate photographic, recording and cutting equipment is readily available and in the hands of trained staff.

The following guidelines will assist evidence gathering:

- Delegate someone to keep a log of events as they happen. This log may be hand written or kept on computer and must be capable of being updated.
- Make every effort to video record and photograph as much of the action as possible.
- The names of persons who witness incidents must be recorded in the log.
- The names of persons who make video or audio recordings or take photographs must be noted.
- Video, audio and other evidence should be collated centrally.
- Accurate plots of all vessel positions and headings must be made at material times of action. This may be crucial e.g. if intentional obstruction of passage occurs.
- Attempts should be made to glean as much information as possible about those you are dealing with e.g. "Who are you? What is your name? Which organization do you represent? What is your position in that organization? What is your aim?" etc.
- If possible, identify those persons by name or at least by sight on the video or photograph.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 80 of 182

- Take possession of and retain for safekeeping any cameras etc. (non-intrinsically safe).
- Always have 2 persons escorting anyone unlawfully onboard. Make pictorial record of the escorts with the intruder.
- Take possession of handcuffs, chains, etc. for evidential purposes.

6.10 Collision or Grounding

The stability and buoyancy of any ship is dependent on the integrity of the hull and the weight distribution. A collision or grounding could possibly cause a hull fracture, which will inevitably affect the stability of the ship, the severity being dependent on the type, extent and location of the damage, intact stability and buoyancy reserves.

In any incident of this type, the first priority is for the Master to consider possible action in case of an imminent danger to the crew or loss of the vessel. During the assessment of the situation the general alarm should be sounded, and all crew accounted for.

In the event of grounding the Master should firstly:

Stop engines and try to assess the extent of any damage to the hull and watertight compartments, while trying to establish the ingress of any water.

Establish if the vessel is in danger of sinking, breaking up, or sustaining further damage.

Consider the possibilities of evacuation, and any limitation to this process due to the sustained damage.

Establish the danger of damage to the environment, and measures to either stem the flow of contaminants being released or prevent any possible leakage.

If the grounding is such that the vessel or crew is in no immediate danger, the following checks should be made:

- The exact position.
- Depth information and tidal conditions.
- Damage to propulsion or steering.
- Possibilities of the vessel being re-floated without assistance.

When it is established that the situation is secure, the nearest local authorities should be notified, along with the owners and charterer's representatives, indicating, as a minimum:

- Name and nationality of vessel.
- Accurate position and extent of damage.
- Casualties, if any.
- Type and extent of possible pollution.
- Precautions that have been taken.

The Master would then be responsible for establishing an estimation of the situation and the outlook. Based on his findings it would then be determined what immediate course of action was required, in respect of ballast, trim, watertight integrity, reduced buoyancy, and whether outside assistance would be needed.

In the event of a collision the Master should firstly:

Sound the general alarm and account for all personnel.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 81 of 182

Establish communications with the other vessel, exchange necessary information and coordinate any rescue action.

Ascertain the extent of the damage and take precautions against pollution damage or explosion.

Close all hatches and openings.

Follow the codes of Maritime Law as for reporting, notifications, gathering and logging information or evidence.

Any request for any outside assistance should be via the owners of the vessel, unless the situation is critical, and the Master has no option but to make appropriate decisions.

6.11 Language for Emergency Communications

The personnel assigned to the Veritas Viking II represent a number of different nationalities. In order to ensure all communications are consistent the language to be used during all emergency and normal operations will be English. The use of English will be used at all times during the following circumstances:

- a) During normal communications over the onboard intercom system.
- b) During all emergency drills.
- c) During all helicopter operations.
- d) During all communications with the chase boat.

Emergency Instructions: all emergency instructions must be written and available for each nationality represented onboard. This information includes:

- 1. Life Boat and Life Raft instructions.
- 2. Fire and Emergency instructions and alarms.
- 3. Life Jacket and Survival Suit instructions.

6.12 Communication Equipment and Procedures

Equipment:

- Full GMDSS Radio Station
- Inmarsat B Station
- VSAT Station
- Tron, type 30S Class 2, 406 MHz EPIRB
- 5 Hand held UHF Radios
- 3 Hand held VHF Radios
- 2 Tron Radar Transponders

Capabilities/Procedures:

The Veritas Viking II produces and transmits a report on a daily basis of its prior 24 hours of activities. It utilizes the VSAT system to communicate this report to Veritas' offices in Houston,

Reports are reviewed on a daily basis by Veritas' land based management team. The report is in the form of written text.

The Inmarsat B system also is available for voice communications on a 24-hour basis. Veritas' land based management team is available via office phone, office fax, home phone, and cellular phone.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 82 of 182

Distress communications are included in the Inmarsat B system.

The VSAT system also provides 24-hour voice communication independent of the Inmarsat B system. Veritas' land based management is also available via the VSAT phone system. The VSAT provides a 24 hour direct link between the vessel and Veritas' offices.

The GMDSS system provides VHF and SSB radio communications in case of Inmarsat B and VSAT failure. Battery power can be utilized in case of total loss of ship's power.

The EPIRB is mounted on the stairway leading into the lifeboat. It is fitted with a hydrostatic release for automatic deployment in case the vessel sinks. It will transmit a distress signal and location to a satellite based alert system.

The radar transponders are mounted inside each bridge wing door and are intended for use in case of life boat and life raft launch. It will transmit a beacon that will help surface ships and low-level aircraft to home in on the lifeboat or raft.

In the event of no contact from a vessel for over 24 hours shore based management are to attempt voice contact via VSAT and Inmarsat B.

In the event Veritas management cannot contact the vessel, the charter management is to be contacted to establish the last time they had contact with the vessel.

In the event voice communications cannot be established Veritas management will attempt to contact the vessel via SSB standby frequency.

In the event SSB communications can not be established, Veritas management are to contact any known stations within the vessel's work area to attempt contact via VHF channel 16. The chase boat working in tandem with the Veritas Viking II would be the first station contacted.

In the event VHF contact cannot be established via local known stations, Veritas will contact the appropriate government agency or Coast Guard to notify them of lost communications and request assistance in establishing communications.

VESSEL ON FIRE SCENARIO

If a fire is discovered onboard, providing safely able to do so, the vessel should be set on a course which puts the fire to the leeward side to minimize the danger of the fire being spread by the wind across or through the ship.

Vessel speed should be reduced to as slow as feasible to maintain steerage and minimize airflow feeding the flames.

If the vessel is on fire and making heavy smoke it would be advantageous if possible to put the wind two points off the bow.

To protect personnel against the possibility of intense heat at the location of the fire, an ample spray of water, (a fog applicator), should be used by the lead team when nearing the scene.

Once the fire is quenched cooling water must continue to be applied over the source and surrounding areas to prevent the fire from re-igniting. Boundary cooling must be applied while fighting the fire to prevent spreading to adjacent areas.

If an installed fixed extinguisher system is used in a confined space all personnel must be evacuated from the area before these appliances are activated.

Raising the Alarm

It is of utmost importance that a fire alarm is raised as soon as a fire is discovered.

The smallest of fires that is allowed to escalate unchecked due to a late alarm being raised or a slow fire team response can have disastrous consequences for both personnel and for the vessel itself.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Emergency Procedures.		Page 83 of 182

Persons first discovering a fire must act quickly and correctly.

The officer of the watch must be alerted immediately so that the general fire alarm can be sounded and information regarding the location of the fire and can be broadcast over the vessel's public address system.

In the early stages it may be entirely possible to bring the beginnings of a fire under control by simple use of a hand held extinguisher.

It follows that the faster that a fire or potential for fire is dealt with exponentially improves the chances of it being successfully extinguished and averting the potential for a crisis emergency situation developing.

Never open any doors to the suspected location of a fire area without first cautiously checking the door for heat and having the use of fire fighting equipment in hand as the fire may immediately escalate and blow back if air is allowed to suddenly flow in to a confined space.

If the first persons on the scene are not able to control the fire those persons must withdraw ideally shutting off the supply of air if possible by closing all doors to the scene and waiting for reinforcements to arrive.

Assign persons to search all nearby rooms to be sure there are no casualties suffering from gas or smoke inhalation.

Always remember that your life is more important than heroics.

Title: Safety Critical Vessel Procedures.		Page 85 of 182

07. Safety Critical Vessel Procedures

7.1 Boarding & Departing Vessel

Introduction

These procedures are for any personnel boarding, or departing the Veritas Viking 2 while in port. The intent of the procedures are to allow the Master, and Party Manager, an accurate "head count" at all times. This serves several purposes, the most important is the knowledge of who is aboard, and their location, should an emergency situation develop. All personnel are to embark and disembark the vessel using the gangway. You should not step between the ship and the dock at any time. During high and low tides the gangway may be at a steep angle, check that you have a firm footing before proceeding, always have one hand free to grasp the handrail.

Visitors should arrive with the appropriate hard hat and safety footwear. If they do not, spare hard hats are available near the gangway; additionally available are ear defenders, and safety glasses. There are signs posted in all areas where the use of head, ear, and eye protection is required. Use of safety equipment is strictly enforced. Visitors are issued a visitor badge. New crew members also receive a "Vessel Orientation" manual. The manual contains information about vessel procedures, and crew responsibilities.

Upon Arrival

The Visitor Book and the Gangway Watch will be stationed either at the Gangway or on the Bridge. The role of Gangway Watch is equally shared between Veritas DGC and the vessel owners on a twenty-four hour system.

Agents, and vendors are escorted at all times. They are not allowed to wander around the vessel.

Contractors, agents, and vendors will report directly to the Master, or Party Manager on arrival as appropriate.

New crew will have a safety briefing and safety manual upon arrival onboard.

Hand held radios will be utilized by the Gangway Watch to notify the Master or Party Manager of visitor arrivals. This will ensure that the watch is maintained continuously.

Departure

All personnel must return their protective gear when leaving the vessel.

All personnel must checkout with the Gangway Watch on leaving the vessel.

Standard Operating Procedure

Failure to comply with these procedures may result in the removal of the offender.

Alcohol, Drugs, and Fire Arms are strictly forbidden. Anyone suspected of carrying contraband is subject to search. This is at the sole discretion of the Master, or Party Manager. Anyone refusing search can be removed from the vessel.

Anyone suspected of stealing is subject to search. Anyone found stealing would be detained until local authorities are summoned.

Anyone suspected of being under the influence of alcohol, or drugs can be refused permission to board the vessel.

7.2 Visitor Badges

Visitors will sign in the visitor's book on arrival. The visitor will detail the location of work, and the person visited. All visitors wear a visitor badge at all times while onboard.

Vessel master to be supplied with a list of names of all visitors and service personnel who will board the vessel at least 24 hours prior to their arrival.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 86 of 182

The gangway watch controls the visitor book. The gangway watch will ensure all visitors sign in on arrival. The gangway watch records the date and time of arrival and departure of each visitor. Crew members will ensure all visitors to their areas have signed in and wear badges.

7.3 Helicopter Operations

Helicopter operations are one of the more hazardous activities personnel will take part in. It is essential that all personnel are attentive when being briefed on helicopter operations and follow all instructions exactly.

Passenger Briefing Instructions

During helicopter operations all personnel are under direct command of the helicopter crew. While onboard the vessel prior to boarding, or disembarking from the helicopter, all personnel are under the direction of the vessel master and designated Helicopter Landing Officer (HLO).

No person will approach the helicopter while the red flashing anti-collision light is on. The flashing anti-collision beacon is used to signal the HLO when it is safe to proceed with the operation. The beacon is off when it is safe to approach.

All personnel will avoid the tail rotor and air intakes of the helicopter.

No person will wear any unsecured objects such as hats, scarves, etc. These may blow away in the down draft of the helicopter.

All personnel will approach the helicopter in sight of the helicopter crew. Note that the forward rotors of some helicopter models dip low in front of the aircraft. Be aware of high winds, which can cause the rotors to dip in any direction.

All personnel in helicopters will wear the seat belts, lifejackets, ear defenders, and survival suits provided by the helicopter crew as required.

All personnel will familiarize themselves with the aircraft's emergency exits and emergency equipment locations. A safety briefing is conducted prior to flight departure, normally with a video or verbal presentation conducted by a helicopter flight crew representative. Once aboard read the aircraft safety card.

When your destination is reached remain seated with your seat belt buckled until instructed by the flight crew to leave the aircraft. Lifejackets, and ear defenders are usually left in the aircraft. Survival Suits are normally removed once inside the terminal, or vessel.

During helicopter operations the FRC should be ready for launch and the attending chase boat, if available, should be positioned on the quarter as appropriate, to assist in the event of an in-water emergency.

Passenger Instruction for Emergency Ditching

In the event of an emergency landing, remain in your seat with your seat belt fastened. If the seat belts are removed, the motion of maneuvering for a landing may throw all passengers to one part of the cabin and cause the pilot to lose control.

Ensure that the survival suit is zipped up (if required).

Remove the ear protectors.

Take up brace position before landing.

After impact, put one hand on the seat belt buckle and the other pointing to the exit door for orientation in case the aircraft inverts.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 87 of 182

The man nearest the door is responsible for opening it.

Before releasing the seat belt count to 10 to allow the aircraft to settle.

Do not inflate the life jacket until you are clear of the aircraft.

Do not stand on inflated floats if the aircraft remains upright.

If the aircraft remains upright, await the pilot's commands to evacuate. He may be able to keep the aircraft upright if the blades are rotating.

Remain close to the aircraft as long as it remains afloat.

Remove life raft, flares, and other survival equipment.

VESSEL EMERGENCY READINESS

The Captain is in overall command during any helicopter operations, assisted by the designated Helicopter landing Officer (HLO). A state of emergency readiness should be maintained onboard the vessel when a helicopter is landing or taking off, a helicopter is on deck with the rotor running, any time the helicopter is refueling or starting the engine(s).

The state of emergency readiness should include these minimum activities and precautions:

- Any available Chase Boats should be standing by in close proximity prepared to recover personnel from the sea.
- Fast Rescue Craft(s) (FRC's) prepared for immediate launch with crews standing by.
- Man overboard floats and raft made ready for immediate deployment.
- Monitors manned with fire main and foam-system pressurized.
- Portable extinguishers made ready.
- Fire team dressed and manning fire stations.
- Other members of deck team dressed in bright colored clothing so as to be easily seen by the HLO and Pilot. Any loose items of clothing and hats should be properly secured.

HELICOPTER EMERGENCY PROCEDURES

Purpose & Scope

The purpose of this procedure is to give guidelines on what action to take during a helicopter emergency on or close to the vessel.

The scope of this procedure is to consider foreseeable emergencies enroute to or from the vessel and when helicopters land and take off from the vessel.

Responsibilities

The Master of the vessel is in overall command during a helicopter emergency. Every helicopter emergency will have its own set of unique circumstances and the Master will have to take whatever action he feels necessary to minimize the damage to the vessel and the environment. The Captain is responsible for all actions taken.

The helicopter emergency team shall carry out regular drills and excises in emergency preparedness to cover all foreseeable helicopter emergencies.

Emergency Deck Procedures - Fire

If on engine start up, the HLO spots an engine fire he will signal to the pilot. On the HLO's signal, the fireman and hose team should become alert to the situation but no action should be taken until

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 88 of 182

the pilot has signaled to the HLO that he cannot deal with the fire.

If the pilot signals to the HLO that he has an engine fire and requires assistance then the HLO will order the firemen in protective clothing to advance on the helideck, taking with them a CO² extinguisher to discharge into the air intakes. The backup fireman should be ready with a hose.

If the engine has a "wet start" a large flame may be seen on the exhaust. This should die and no action should be necessary unless there is running fuel on the air frame that may ignite. Again the backup fireman should be ready with the hose.

If, for any reason, there is a fuel spillage fire, the fireman in protective clothing should advance towards the helicopter with the dry powder to quickly tackle the fire and to protect the passengers and crew as they escape. The hose team should attempt to wash away any fuel/flames with light water. Care should be taken not to direct the hose on to any personnel in the area or into the engines or turbines.

The ships fire alarm should be sounded. In the case of a spreading fire, the prime objective is to keep the flames away from the cabin area to allow the crew to escape. In an engine fire, no water or dry powder should be used unless the fire turns into a spreading fire.

Emergency Deck Procedures - Crash

Firefighters should be in a protected area, behind the "Crash Shield" during helicopter operations, to prevent them from being injured by rotor scatter. The positioning of the protected area is such that the firefighters are in close proximity to the helideck fire fighting equipment to save time in them arriving on the scene of the fire.

If after a hard landing, the pilot is unconscious and there is no one with the skill to enter and turn off the fuel and switch off the power, the engine may be stopped by putting a jet of water into the air intake.

Start applying foam immediately whether or not ignition has occurred if there is spilling fuel. (The exhaust is hot enough to ignite it on contact).

Apply foam first to the fuselage, this will tend to protect it from heat and as the foam runs off it will take the fire away from the fuselage.

Firefighters with hand lines should get in close, as quickly as possible taking the fire away from the cabin area.

There is danger from pop-out flotation pods on the wheel rims of some helicopters. Do not stand in line.

If the helicopter is engulfed in fire, there is danger to firefighters from exploding hydraulic reservoirs. The undercarriage must be cooled before any close approach.

Try to reserve some powder for knocking back flame away from rescuers or rescued persons.

The inside of the helicopter will have plush furniture with the attendant fire risk and thick black acrid smoke. Breathing apparatus and spray will be needed for internal fires.

Certain doors and windows may need to be jettisoned. A window may be broken by making it cold with a CO² extinguisher and striking it with a rescue axe.

Injured passengers may be suspended on the high side by their harnesses. They must be lowered gently. The pilot has a lever on the left side of his seat to slacken the inertia harness after which it may be released in the usual way.

Once rescue is complete and the medical first aid attention is being given, firefighters must make sure all fire is extinguished without disturbing the wreckage any more than necessary pending investigation. This is of particular importance in the case of a high impact crash.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 89 of 182

Emergency Deck Procedures - Ditching

Mark the chart in the exact spot of the helicopter entering the water and the exact time, and give an advisory message on Channel 16.

Immediately launch the FRC's, and if applicable move the chase boat into a position that will enable it to support the rescue craft.

The FRC must not approach the helicopter until the rotors have stopped turning.

Once the rotors have stopped turning, the rescue craft can approach the helicopter and assist survivors into the rescue boat. The rescue boat must not at any time attach itself to the helicopter.

The FRC must not create a wash around the floating helicopter as this may add to the stability problem.

All efforts should be made to rescue all personnel without endangering the lives of the rescuers.

SEA RESCUE BY HELICOPTER

Once the helicopter has become airborne how soon it locates the causality and how effective the rescue is depends to a large extent on the actions and preparedness of the vessel itself.

Vessel Identification Aids

From the air, especially if there is a lot of shipping in the area, it is very difficult for the pilot to identify a particular ship from the many that he can see unless the distressed ship uses a distinctive signal.

In daylight the use of an orange coloured smoke signal is very distinct when seen from the air, another signaling method could be with the use of an Aldis lamp which is also quite effective in daytime except in very bright sunlight.

Position Accuracy

Because of the operational limitations helicopters must not be unnecessarily delayed at the scene of the rescue. It is essential that the ship's position is given as accurately as possible if the original signal is made by radio or as a mayday relay.

Helicopter Approach

A helicopter will normally approach the ship from astern and hover over the helideck area heading into the wind. In order for the helicopter pilot to have as much area as possible on which to operate consistent with the helicopter remaining heading into the wind, the ship should steam at a constant speed heading 30 degrees to starboard of the prevailing wind direction.

Rescue via Helicopter Winch

The maximum length of a helicopter rescue winch cable is typically 200 feet. On no account should the strop be secured to any part of the vessel or allowed to become entangled with any part of the ship's rigging or fixtures.

Professional rescue organizations such as the coastguard are expertly practiced in rescuing survivors either from a deck of a ship or from the sea itself.

In some circumstances the victim may be hoisted by means of a strop. In this event a crewman will be lowered from the helicopter together with the strop which will be secured around the victims back and chest.

If a victim's illness or injury is such that the use of a strop around his back or chest would aggravate the situation or cause suffering a crewman will be lowered to the deck with a stretcher. The victim would then be placed in the stretcher and strapped in such a manner that it is impossible for them to slip or fall out and both stretcher and crewman would be winched up to the helicopter together.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 90 of 182

If required and if prearranged, the helicopter may be carrying a doctor who will be lowered to the deck to assist with other victims.

Helideck Obstruction Scenario - Fire

In the event of a streamer deck fire or helideck obstruction making a landing or hovering maneuver impossible it may be possible for the helicopter to lift a man from an FRC towed astern on a long painter.

In the event that the vessel is on fire with the heliport obstructed and all FRC's and lifeboats out of commission being unable to be launched then it will be necessary to use an inflatable raft.

On the approach of the helicopter the inflatable raft should be streamed complete with victim and attending crew secured a minimum of 100 meters aft of the parent vessel.

RADIO COMMUNICATIONS

The success of any helicopter operation depends on establishing and maintaining good radio communications.

Communications during a helicopter operation should be conducted directly between the ship and helicopter and avoiding the need to relay through third parties if at all possible.

In the event that information or confirmation must be relayed through a third party it is essential that the identical format, style and content of the message is relayed exactly as it was received. Do not paraphrase.

To avoid miscommunication speak slowly and clearly to ensure that essential information is understood correctly. Insist that the information being passed is repeated back by the person on the receiving end to confirm that what was heard is actually the same as what was said.

Establish and confirm with the helicopter operator that a stated rendezvous point is suitable and within range of the helicopter. If the rendezvous point is unsuitable the Master must immediately be notified and a new rendezvous position established.

Message Format:

It is recommended that the format, style and content of emergency radio messages are based on the following outline.

- Name Of Vessel
- Call Sign
- All Radio Frequencies Being Used & Monitored
- Present Position
- Heading
- Speed
- ETA To Rendezvous Point
- Position Of Rendezvous Point
- Number Of Personnel To Be Evacuated
- Local Weather
- Sea State
- Pitch And Roll
- Visibility
- All Other Relevant Information

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 91 of 182

VESSEL ON FIRE SCENARIO

If a fire is discovered onboard, providing safely able to do so, the vessel should be set on a course which puts the fire to the leeward side to minimize the danger of the fire being spread by the wind across or through the ship.

Vessel speed should be reduced to as slow as feasible to maintain steerage and minimize airflow feeding the flames.

If the vessel is on fire and making heavy smoke it would be advantageous if possible to put the wind two points off the bow.

To protect personnel against the possibility of intense heat at the location of the fire, an ample spray of water, (a fog applicator), should be used by the lead team when nearing the scene.

Once the fire is quenched cooling water must continue to be applied over the source and surrounding areas to prevent the fire from re-igniting. Boundary cooling must be applied while fighting the fire to prevent spreading to adjacent areas .

If an installed fixed extinguisher system is used in a confined space all personnel must be evacuated from the area before these appliances are activated.

Raising the Alarm

It is of utmost importance that a fire alarm is raised as soon as a fire is discovered.

The smallest of fires that is allowed to escalate unchecked due to a late alarm being raised or a slow fire team response can have disastrous consequences for both personnel and for the vessel itself.

Persons first discovering a fire must act quickly and correctly.

The officer of the watch must be alerted immediately so that the general fire alarm can be sounded and information regarding the location of the fire and can be broadcast over the vessel's public address system.

In the early stages it may be entirely possible to bring the beginnings of a fire under control by simple use of a hand held extinguisher.

It follows that the faster that a fire or potential for fire is dealt with exponentially improves the chances of it being successfully extinguished and averting the potential for a crisis emergency situation developing.

Never open any doors to the suspected location of a fire area without first cautiously checking the door for heat and having the use of fire fighting equipment in hand as the fire may immediately escalate and blow back if air is allowed to suddenly flow in to a confined space.

If the first persons on the scene are not able to control the fire those persons must withdraw ideally shutting off the supply of air if possible by closing all doors to the scene and waiting for reinforcements to arrive.

Assign persons to search all nearby rooms to be sure there are no casualties suffering from gas or smoke inhalation.

Always remember that your life is more important than heroics.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 92 of 182

OBSTRUCTED HELI-DECK

The helideck must be kept clear of obstruction & debris at all times. Helideck barriers must be lowered, at the time of helicopter departure from the heliport

Loose equipment or debris can be blown off the deck by the helicopter down draft. Clearance for helicopter arrivals or departures must not be given until the HLO (Helicopter Landing Officer) has completed a check for loose equipment or debris both on the helideck and surrounding areas.

Relevant personnel must be instructed that no operations are to be carried out on or around the helideck that could result in helideck obstruction until the HLO has confirmed that no helicopter operations are scheduled and the helideck perimeter fences have been secured in the vertical position.

All personnel should be made aware that the helideck is off-limits while the safety fences are lowered and the helideck safety barriers have been removed.

In the event of an unavoidable obstruction to the helideck during a period of planned helicopter operations, the helicopter company and/or the helicopter pilot must be immediately informed of the problem and the estimated time required to clear the obstruction.

During landing, embarkation and take-off, all off-going and on-going passengers must ensure that their bags and other personal items do not obstruct hoses, fire extinguishers, the fire teams or any other safety equipment on or around the helideck area.

HELICOPTER USE FOR MAN OVERBOARD

In the event of a Man Overboard situation the vessel will enter emergency status and all designated personnel will proceed immediately to their assigned Man Overboard (MOB) stations.

The Captain will immediately notify the Coast Guard. He will also broadcast on VHF channel 16 and/or on SSB 2182MHz to all ships in the vicinity that there is a Man Overboard and for all ships to keep a sharp lookout.

The last known position of the MOB will be taken from the onboard SPECTRA navigation system and also the bridge GPS navigation equipment.

The Coast Guard Coordination Centre will take overall responsibility for the Search and Rescue operations in conjunction with the Master assigning surface rescue vessels, helicopters and/or fixed wing aircraft as appropriate.

SEARCH AND RESCUE

Emergency Preparations.

If a helicopter is assigned to assist the vessel in Search and Rescue the vessel will be brought to VESSEL EMERGENCY READINESS. (as previously outlined under Article 2.0).

Depending on the nature of the emergency the following actions may be required if undertaking Search and rescue operations.

The Master, Chief Officer and Party Manager or their designates will to co-ordinate the necessary resource allocations.

All in-water towed equipment will be jettisoned or recovered as instructed by the Party Manager.

In the event that towed equipment is jettisoned, as many markers or floats as possible should be attached to the jettisoned equipment so that it can be tracked by the seismic vessel, and remain visible to other surface ships. A navigation warning will be broadcast warning other surface vessels.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 93 of 182

Update the bridge as soon as each piece of equipment becomes clear of the water or is let go.

Onboard (FRC's) Fast Rescue Crafts to be made ready and lowered to pre-launch positions on instructions from the Master.

Assigned First Aid parties to be alerted to position to standby.

Designated fire/rescue teams to be mustered and team leaders briefed..

Portable appliances, heaving lines, nets and stretchers to be made ready as required.

Assign designated lookouts around the vessel as required.

Inform the lookouts of the length of their watch and the name of their relief.

All personnel to remain in a state of readiness for the duration of operation.

VESSEL EMERGENCY SUPPORT

Upon receiving request from the appropriate authorities and depending on the nature of the emergency the vessel will be brought to a state of VESSEL EMERGENCY READINESS as outlined under Article 2.0.

- A constant line open line of communication is to be kept open with the controlling Emergency Co-ordination Centre.
- Radio working frequencies of all participating must be made known and logged.
- FRC's and FRC crews to be made ready and positioned on standby as required.
- Hospital tenders and First Aid Teams to be mustered and briefed on situation.
- All off-shift personnel to be mustered and updated on current situation.
- As situation develops Fire/Emergency teams to be mustered as required.
- Vessel to be kept in a higher state of readiness for duration of operation.
- Assign a watchman and designate a relief person as required to keep a continuous log of events.

AIRCRAFT SIGNALS TO SURFACE ASSISTANCE

If unable to communicate via radio, to direct vessels in the vicinity to the assistance of a distressed vessel an aircraft will perform the following maneuvers in sequence*

1. Aircraft circles the requested surface assistance vessel at least once.
2. Aircraft crosses the surface assistance vessel course close ahead at low altitude while rocking the wings or opening and closing the throttle or changing the propeller pitch.
3. Aircraft leads in the direction in which the surface assistance vessel is to follow.

* (Repetition of signals have the same meaning).

Note: An aircraft crossing the surface vessel's wake close astern at low altitude while rocking the wings or opening and closing the throttle or changing propeller pitch means that the assistance of the surface vessel is no longer required.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Two personnel to handle deck operation.
- Frequent and documented inspection, maintenance, and inspection of Crane, wires and lifting strops.
- Use of one or more tag lines depending on weather conditions.
- Inspection of load prior to lift. Use of strops to lift all pallet loads. Use of pallet forks is prohibited.
- Permit to Work approval process.
- Person assigned to standby manual controls in case of remote control failure

Responsibilities:

The crane operator is responsible for the operations. New personnel onboard will be tested for competency by the Master or Chief Mechanic, to assess their experience and safety knowledge of crane operation.

Training

At least one person from each Seismic shift to be trained onshore to recognized standards in Crane operations, rigging and slinging. This person will then train other suitable individuals on the crew.

An experienced operator who will have responsibility for the operation must always directly supervise inexperienced crane operators. This training will conducted with the ship alongside.

Procedure

The Chief Mechanic or Crew Leader is notified by the party requiring crane operations.

The Chief Mechanic or Crew Leader requests permission from the Bridger for crane operations. If approved, the Permit To Work process is completed on the Bridge.

The Chief Mechanic or Crew Leader is responsible for briefing the crew and assigning job tasks, and ensuring the crane crew is wearing the correct PPE.

He must conduct a visual check of the strops, wires, hooks and all lifting devices and verify the compatibility with the Safe working Load of the crane being used for the operation.

After inspection of the crane, the Lock Out/Tag Outs are removed or the hydraulic system initialized by the Chief Mechanic or Crew Leader.

The minimum team should consist of 3 people: 1 crane operator, 1 helper at the loading area and 1 helper at the unloading area. This number should be increased according to the line of sight, the lifting device being used and the weight and size of the load. In all cases a visual has to be maintained between the crane operator and the loading and unloading areas.

Any failure should be reported and the operation should not start until it is certain that all equipment and conditions are safe.

The crane team must communicate by signs and/or headcoms. If using hand signals, these must be in accordance with standard recognized & approved crane operating signals. The crane operator must wait for the OK of the helper before lifting the load. In the case of two helpers working together, one must be designated person to communicate with the crane operator.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 96 of 182

Assess wind force and direction, sluing the crane in the same direction as the wind could cause the load to become unstable.

Crane operator to use minimum length of cable during the lifting operation.

Upon the completion of crane operation, the Chief Mechanic or Crew Leader installs the Lock Out / Tag Outs or disengages hydraulics and then ensures all rigging gear is in the proper storage areas.

Any loose cargo or equipment should be secured, or taken below decks for secure stowage.

The following guidelines should also be adhered to when performing crane or hoist operations:

Pulling by hand any hanging load is dangerous. The load must be preferably pushed if adjustment is necessary and there must be nobody standing in the direction of the pushed load.

Never stand under a hanging load. Never travel with the load.

Emergency exits, escape routes and fire-fighting equipment must be kept clear of obstruction. Never set load loads down in an area that is likely to cause an obstruction.

The crane operator must avoid passing loads over gangways.

Adjust lighting for a clear view of all operations during hours of darkness.

If operations are halted, do not leave a load hanging; set it on the deck.

Only vertical lifting is authorized. To push or pull a load with the crane is forbidden.

Open hatch ways require guards on perimeter at all times.

7.5 Lock Out/Tag Out

Overview

The Lock Out/Tag Out system is designed to prevent the operation of any system that has been found to be unsafe, is undergoing repair, maintenance, or inspection, or requires authorization for use.

In the cases where equipment has been found to be unsafe or is undergoing repairs, maintenance, or inspection, this procedure will protect the health and safety of personnel and prevent equipment damage or loss by preventing the uncontrolled release of energy. This procedure establishes requirements for isolating of both kinetic and potential electrical, chemical, thermal, hydraulic and pneumatic and gravitational energy prior to equipment repair, adjustment or removal.

Authorized persons called the "Key Holder" can only energize the systems that are locked out. Key holders are qualified based on their experience and training and knowledge of the system. In the case of maintenance, the Key Holder is the person performing the work on the system. For normal operations, that require strict procedures before energizing the system, there is one designated Key Holder.

If a system is under repair, i.e.: an electrical circuit, the lock out is located at the origin of the circuit that effectively isolates that system from electrical circuit. Any mechanical device that physically prevents the transmission or release of energy device is known as an energy-isolating device. These include, but are not limited to, manually operated electrical circuit breakers, disconnect switches, line valves, and blocks

The circuit breaker supplying the device under repair is locked, and tagged with the name of the person performing the work on the device. He is the only person who may remove the lock. This is assured, as he holds the only key to the lock.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 97 of 182

Due to the necessity to operate equipment without delay, I.E. Streamers crossing online, equipment onboard is to be treated as if active at all times.

The Chief Engineer holds the key for all ships Machinery Spaces and the Technician for all electronics.

These procedures provide an effective control for the tagging out of plant and equipment, to ensure the safety of personnel and prevent damage. All employees, contractors and client personnel working within the vessel must adhere to these regulations and procedures.

Each department key holder is responsible for fully and correctly instructing all personnel under their control in the purpose and use of the Lockout/Tagout systems employed on the vessel. They must be certain that all personnel under their control fully understand and obey these systems.

Key Holders

This is defined as being a person or persons directly responsible for administering the particular task at hand, overseeing an employee, a group of employees and/or contractors.

Terminology:

Lockout - The placement of a lockout device on an energy-isolating device, in accordance with an established procedure, ensures that the energy - isolating device and the equipment being controlled cannot be operated until the lockout device is removed.

Lockout device - Any device that uses positive means such as a lock, either key or combination type, to hold an energy - isolating device in a safe position, thereby preventing the energizing of machinery or equipment. When properly installed, a blank flange or bolted slip blind are considered equivalent to lockout devices. There should only be one key per lock and NO master keys for these special use locks. This prevents the inadvertent opening of a lock by unauthorized personnel

Tagout - The placement of a tagout device on an energy-isolating device, in accordance with an established procedure, to indicate that the energy - isolating device and the equipment being controlled may *not* be operated until the tagout device is removed.

Tagout device - Any prominent warning device, such as a tag and a means of attachment that can be securely fastened to an energy-isolating device in accordance with an established procedure. The tag indicates that the machine or equipment to which it is attached is not to be operated until the tagout device is removed in accordance with the energy control procedure.

The "Lockout Tag" is red in color on a white background and can only be tied off.

Lockout and Tagging Procedure:

Personal Lockout/Tagout System

Introduction

The Lockout/ Tagout System is designed to give an employee personal protection while working on isolated plant and equipment.

A Danger Tag must be attached to the isolated switch, valve, or other positive isolation device of the unit. Where these isolation points can be physically locked out, then a Special Use Lock or other appropriate energy-isolating device should be applied,

Some switches are not positive isolating switches and will not give sufficient protection. Such switches are those of the push button type or emergency shut down buttons. Special safeguards should be implemented to prevent the energizing of systems that cannot be mechanically isolated from energy sources. These circumstances should be identified during JSAs and Toolbox meetings conducted prior to working on these systems. The special requirements for preventing the accidental energizing of this system should be recorded on the Permit to Work and communicated to all effected personnel.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 98 of 182

It is the responsibility all personnel to:

- Place their own personal Danger Tags and Locks or other energy isolating devices on the appropriate isolation point before commencing work. Where more than one person working on the same job, each person must place his or her own Danger tag on the isolation point. In the case of Lockouts each person must use his or her own padlock.
- Ensure that the Tag is filled out legibly and correctly with the appropriate details.
- Securely attach or lock the tag to the appropriate isolation point, having firstly placed the device in the safe position, and the tag is clearly visible.
- All hand written tags are to be destroyed on completion of the job. Any Lockouts are to be removed and returned to the Lockout Station upon completion.
- Any Switch, valve or other positive isolation point to which a Danger Tag has been attached **MUST NOT BE OPERATED**. The only person authorized to remove Locks and Danger tags from a switch, valve or other positive isolator, is the person who placed it there.

When Danger Tag and Lock has been left on a switch, valve or other positive isolator, and the person responsible for the tag is unavailable to remove it (due to having left the workplace) the person in charge of the workplace, having ensured that it is safe to do so, may remove the tag and lock.

The circumstances surrounding this type of incident are to be fully investigated and a report made out.

If a Danger Tag is not immediately available, work on the equipment to be isolated must not commence until a tag is in place and energy isolating devices set in place

Danger Tags and Locks may only be removed upon completion of the job after the authorized persons have declared the equipment safe and ready to operate. If the system is not ready to return to service at the end of shift change, danger tags and locks shall remain in place until the equipment has been declared safe and is ready to be placed back in service. A change of control procedure must be used to replace the tags and locks of the departing shift with those coming on shift. This change shall be noted on the Permit to Work.

7.6 Cutting/Welding

Overview

The use of burning and welding equipment can be hazardous if not properly used and monitored.

Onboard this vessel the use of cutting equipment is often required. However, because these systems produce a naked flame, control must be exercised on use and location of the intended hot work. Many flammable liquids are carried onboard and there are many areas of increased risk should a flame be present. To control and monitor the proper use of burning and welding sets, a permit will remain in force at all times. The "Hot Work Permit" form is available from the Mate on the bridge or Master.

Procedure

Whenever the use of burning gear or a welding set is requested the operator will carry out the following procedure:

- 1 Inspect the work area to ensure it is free from flammable material.
- 2 Establish the exact location in relation to adjacent storage of materials of explosive content.
- 3 If cutting or welding on a tank, a "Gas Free Certificate" is required.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 99 of 182

- 4 Ready the suitable fire fighting equipment. The operator should have a Dry Chemical extinguisher at the job.
- 5 Maintain a fire watch during and after the hot work is complete.
- 6 Obtain a signed welding/burning permit from the Officer on Watch, Master. The permit will state the name of the hot work operator, and the fire watch, along with the following checklist:
 - 1 Nature of work.
 - 2 Location of work.
 - 3 Time of Start.
 - 4 Time Complete.
 - 5 Fire hose run out.
 - 6 Portable extinguisher on site-correct type.
 - 7 Name of Fire Watch and times active.
- 7 Deactivate any heat or fire sensors, close to the job, that may cause a false alarm. This is only applicable if authorized by the officer on watch.
- 8 Ensure adequate ventilation, and be aware of any build-up of toxic gases, i.e. burning paint, insulation etc.
- 9 The operator will wear the appropriate PPE.

7.7 Oxygen & Acetylene Cylinder Handling

Overview

Oxygen & Acetylene Cylinders should always be maintained in good condition and ready for use. These cylinders are under high pressure and volatile if exposed to hazardous conditions. The following guidelines should be observed for the storage and use of these cylinders: -

- 1 Cylinders should always be stored, handled and used in a vertical position.
- 2 Cylinders should always be stored in a dry, well-ventilated area, and not in contact with a continuously wet area, to prevent rusting.
- 3 Empty cylinders should be stored separately to prevent confusion.
- 4 Cylinders should never be lifted by their valves, and valve caps should be used when moving or lifting cylinders.

7.8 Cable Oil Handling

Overview

Various brands of Cable Oil exist, refer to the MSDS manual for exact product details, whenever handling these products. Cable oil, commonly referred to by the brand name "Naroma", is the liquid used as an aid to prevent water intrusion in the cable and acoustically couple the hydrophones to the water. The Cable oil is a particular blend of petroleum based solvent products, it is highly flammable with a low flash point. Although the Guardian Solid Streamers contain only a small amount of cable oil, as compared to a conventional seismic streamer, the same precautions must be observed.

No smoking, welding, or open flames are permitted at or near the cable reel or cable work area.

Exposed skin and clothes should be washed with water immediately after coming into contact with Cable Oil. As is the case with many solvents, the high evaporation rate of the product will cause a

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 100 of 182

'burning' sensation if allowed to remain in contact with the flesh and can cause irritation and rashes.

Do not allow Cable Oil get into the eyes. If in the eyes, flush immediately with water at the nearest eye wash station. Eye wash stations are located on Reel Deck, Gun Deck, Cable Store and Gun Shack.

Under normal operations the new, or clean cable oil is stored in one tank, and the waste or contaminated cable oil is stored in another tank. Both tanks are piped to the Streamer Deck for the filling and draining of streamer sections. Care is necessary, in order that waste cable oil is not returned to the clean tank.

New Cable Oil is delivered to the vessel by bulk tanker, rarely by drum due to the quantity. The loading and unloading of Cable Oil is under the direct control of the Chief Engineer, and is performed by pumping the product into the fill pipe located on 1st Deck (stbd).

Recycling of contaminated Cable Oil should be performed where possible. An Alfa Laval, centrifugal purification system is located in the Purification Room.

Procedure For Re-cycling Contaminated Cable Oil

Potential Hazards

Cable Oil is a solvent and can cause burns and irritation to exposed skin and eyes.

Fire due to the low flashpoint of cable oil.

Marginal Weather and Sea conditions.

Falls caused by slippery footing from water and spilled cable oil.

Preventative Measures

Training of personnel in the operation of purifier.

Use of additional protective equipment as the conditions merit.

Training on fire foam system use.

Location of an eye wash station and shower near the Purification Room.

Strict control of cable oil spills. Immediate clean up of spills.

Standard Procedure

Check that drip trays below the streamer reels are fully drained, gain permission from the Chief Mechanic if draining is required. Draining is accomplished using the two-way valves on the Gun Deck.

Once the Cable Oil has been transferred to the Dirty Oil Tank, it should be allowed to settle in the tank for approx. 24 hours, giving the product and contaminates, mostly water, ample time to separate.

Start purification system. This will draw the product from the bottom of the tank, through the purifier, and back into the top of the tank. To start the Alfa Laval Centrifuge:

1. Open Fresh Water Valve.
2. Open Purifier Suction Valve slightly to allow pump lubrication.
3. Turn switch at the contactor box to "ON".
4. When the Purifier reaches full speed, (observe drop in amps to indicate full speed being reached) move switch at the control box to the "1" position.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 101 of 182

5. Open the suction and return valves to the tank that requires purification.
6. Adjust purifier suction and discharge valve to attain correct separating pressure. (The correct pressures are marked on the discharge pressure gauge).
7. When the purification process is complete, move the switch at the control box to position "2". This is the self-cleaning program, to eject sludge build-up.
8. When the cleaning process is complete, move the switch at the control box to the "0" position, and the switch at the contactor box to "OFF".
9. After several complete cycles, the product should be sampled with the Petro-Gauge, which will detect any water that remains. Once the Petro-Gauge shows no trace of water, the purification process is complete and the re-cycled Cable Oil can now be transferred to the clean oil holding tank.
10. Close the return valve to the tank containing the re-cycled product, and open the suction valve to the clean oil holding tank. The re-cycled product will now be pumped into the clean oil holding tank.

Procedure For Draining and Filling Oil Filled Streamer Sections

Note: This procedure is not for Guardian Solid Streamer sections

Potential Hazards

- Cable Oil is a solvent and can cause burns and irritation to exposed skin and eyes.
- Fire due to the low flashpoint of cable oil.
- Personnel are working near the stern.
- Marginal Weather and Sea conditions.
- Falls caused by slippery footing from water and spilled cable oil.
- Electric shock from cable DC power.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Two personnel utilized to handle deployment and recovery operation.
- Training on fire foam system use.
- Location of an eye wash station and shower near the Streamer Deck.
- An extra fire extinguisher brought to the area during operations.
- Strict control of cable oil spills. Immediate clean up of spills.
- Good communication between the Recording room and the streamer team on the streamer power status.

Standard Procedure

- Check that drip trays in cable store are fully drained, gain permission from the Chief Mechanic if draining is required.
- Clean out any debris from drip trays. Check that filters are correctly installed, if not inform Chief Mechanic.
- Stretch out the damaged section on the false deck above drip tray in order that any contaminated Cable Oil can be drained.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 102 of 182

Remove plug screw and air vent screw from the end over the drip tray.

Gravity will allow most of the oil to drain from the streamer section. To ensure all oil is drained, start at the end of the section that is on the deck and holding it waist to shoulder height, "walk" the oil down the section towards the drip tray. To assist this process compressed air may be applied to the section. Care must be taken not to apply too much air as this may over stretch the skin, or damage hydrophones in the section.

If patching can repair the section, follow the procedures as detailed in the section "Streamer Deployment and Recovery".

Filling a section is basically the reverse of the above. Attach the filler nozzle to the filler hole on the section, hold the section shoulder height and proceeding up the section at the same rate as oil flows into the section, ensuring as little air as possible is left trapped. This can be achieved by squeezing the section ribs to allow air bubbles to rise into the next ribbed section. It is important not to overfill the section.

It is imperative for any section that is shipped off the vessel, to be in a fit condition, this being that it has no leaks. Any skin damaged (holed) sections need to be drained of oil, and the holes to be taped up.

7.9 Lithium Battery Storage & Handling

Introduction

Lithium Batteries must be considered potentially more hazardous than alkaline batteries, and do require special use and handling precautions which must be strictly observed and followed. Ensure all personnel handling Lithium batteries have read the appropriate MSDS and are aware of the hazards associated with this product.

In order to prevent the inadvertent shipping of lithium batteries, all birds and pods shall be shipped off the vessels with the nose cones removed and packed separately in the box.

Six of the most important of these precautions are:

1. Do not allow Lithium batteries to get wet. Store in a cool, dry and well-ventilated storage space.
2. Do not allow Lithium batteries to touch each other.
3. Do not charge or re-charge Lithium batteries.
4. Do not open, damage, solder or incinerate Lithium batteries.
5. In case of fire, use only Lithium-X/Class D fire extinguishers.
6. Follow appropriate Veritas DGC, Federal, State and local regulations for shipping and disposing of Lithium batteries

Shipping and Handling

Lithium batteries are packaged and shipped from the manufacturer in special metal containers. Each battery pack is packaged in an individual tube. As long as each battery pack remains in its individual package and not allowed to touch another battery pack, no danger exists.

Lithium batteries should only be transported in the special storage boxes as supplied by the manufacturer or those contained on the vessel.

Lithium batteries for disposal should also be packed in separate compartments and transported in the special containers.

No special handling equipment or PPE is required for lithium batteries unless the cell is damaged or exposed.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 103 of 182

All shipments of used batteries require a separate transmittal to ensure proper disposal.

All shipments of used batteries require special labeling to identify the contents of the shipment. Shipping containers must be marked with U.N. Class 9 Miscellaneous Hazardous Goods labels.

Storage

Lithium batteries should be stored in the original manufacturers shipping containers or in the battery storage locker. The individual cells must not be allowed to touch and should be separated by partition built or installed within the container.

Containers and individually secured Lithium batteries should be stored in a cool, dry area (elevated temperatures can result in shortened battery life) within a locker or cabinet in a well ventilated area.

The battery containment locker should be located internally on an unexposed deck, free from moisture, humidity and condensation. No other items should be stored in the locker and no objects should ever be placed on top of open battery containers.

All shipping containers should have the covers in place and all open edges should be sealed with waterproof tape.

Handling and Use Precautions

Mechanical Containment: Encapsulation of Lithium batteries will not allow cell venting at low pressure. Such enclosure can result in high-pressure explosion from inadvertent charging or high temperature environments (in excess of 100 degrees C). Heating above 354 degrees Fahrenheit will lead to melting of Lithium and represents a severe fire/explosion hazard.

Charging: Lithium batteries are primary cells and are not designed to be charged or re-charged. To do so may cause the cell to leak or explode.

Other: If soldering or welding to the battery terminals is required, exercise precautions to prevent damage to the cell which may result in loss of cell capacity, loss of the battery seal, leakage and/or explosion. In no incident should any soldering or welding be done on the battery case.

Defective or damaged batteries need to be monitored or checked regularly in case of leakage or reaction.

Special Safety Precautions

Installation

- a. Follow the manufacturer's recommendations for longlife Lithium battery installation, ensure all PPE is in place, including Lith-X/Class D Extinguisher.
- b. Check all seal o-ring connections for damage or deterioration before installation. Replace as required.
- c. Check all battery pack wiring for corrosion or damage before installation. Do not install a visibly defective pack.
- d. Testing of Lithium battery packs should be done with 20-30 ohm watt resistor across the battery terminals.
- e. When removing the battery packs from the recovered bird units, place the unit in a vertical position with the battery pack pointing down before removing. This will keep any accumulated water from around the nose of the bird from running into the body.

Emergency Procedures

In most normal operations, handling and use of Lithium type batteries will pose no problem. These EMERGENCY PROCEDURES are generated to assist all personnel in understanding how to handle any situation that may occur in the event of battery damage or case failure.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 104 of 182

Stored Battery Emergency

In case of battery pack rupture, explosion, high heat build-up or toxic gas release, all involved personnel are to put on PPE before attempting any action.

- a. Have a Lith-X/Class D fire extinguisher manned and ready.
- b. Determine problem source.
- c. Remove all damaged and affected batteries from the problem source and place each individually in a heavy wall plastic bag, plastic box or other solid container.
- d. Remove all other unaffected batteries from the problem source and store clear of the area.
- e. Rectify the problem source. Clean any contamination with dry wipes and re-check the storage containment area for any additional hazards that may exist.
- f. Replace all unaffected batteries in the storage area after checking each individual shipping or containment box and the condition of each battery within.
- f. Dispose of all affected batteries in accordance with all Veritas DGC, State and Federal regulations.

Recovery of Lost Cable/Streamer:

- a. In the event of a streamer loss, accurate depth readings must be obtained to determine what depth the cable may have sunk. Lithium battery cases are designed to withstand water depths of less than 300 metres. In water depth greater than 300 metres, the battery cells could experience external pressures in excess of 1,800 psi causing breakage of the glass to metal seal and flooding of the cell. This can cause the battery to short internally, releasing toxic gasses and high temperatures.
- b. If the streamer has not sunk or has sunk in water depths of less than 1000 feet, the cable may be recovered as normal. All birds should be inspected for case deformation and / or water contamination.

Note: Use caution during this recovery and inspection operation. Be alert for any unusual conditions such as heat build-up on the battery tube, case burn through, toxic gases etc....

During all recovery and launch operations, have a Lith-X/Class D fire extinguisher available along with a Lithium PPE Handling kit. (See SPECIAL EQUIPMENT SECTION)

- c. If the cable / streamer has sunk below 1000 feet, recovery should be delayed by at least 24 hours. This delay will allow any crushed battery cases to exhaust themselves in the water and minimize topside danger of fire, explosion and / or the release of toxic gases.

After the initial waiting period, recovery of the cable / streamer should be conducted with EXTREME CAUTION.

Fire fighting equipment should be at the ready and Lith-X fire extinguishers manned.

All members of the recovery team should wear lithium personnel protective equipment (PPE).

- d. All bird assemblies and battery housings should be disassembled on an open deck with good cross ventilation. A vice should be used to hold each housing in place, as the sealing mechanism is undone. Pressure build-up in the housings are a distinct possibility, therefore extreme care must be exercised when opening each battery compartment.
- e. If fire erupts in an assembled battery housing while the bird is still attached to the cable during the recovery operation, return the cable overboard and wait until extinguished.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 105 of 182

If the bird and / or housing has been removed from the cable sections and fire erupts, extinguish the fire with Lith-X/Class D fire extinguisher or throw all components overboard until extinguished. (Recover extinguished components if possible for proper disposal)

Note: Protection of personnel, followed by the onboard cable from any possible fire hazard is a priority.

- f. All recovered batteries, damaged or undamaged, should be placed in heavy wall plastic bags, plastic boxes or other solid containers and stored separately for disposal. (Do not store with new or depleted cells since electrolyte may react and corrosion set up)
- g. Proper procedures should be followed upon reaching port.

EMERGENCY EQUIPMENT

The following equipment should be provided and kept accessible during the storage, use and handling of lithium type batteries.

- a. Lithium-X (Lith-X/Class D) type fire extinguisher.
- b. Plastic or other solid containers for individual placement of damaged cells. (Heavy wall plastic bags, plastic boxes, plastic tubes with end caps, wooden containers etc.)
- c. Large shipping containers constructed of heavy wall plastic with sealing lids for transporting and disposing of damaged batteries.
- d. Lithium PPE Handling Kit consisting of:
 - Butyl rubber gloves (thick wall) with wrist cuffs
 - Face Shield or goggles
 - Acid gas filter mask (SCBA gear may be required if toxic gases are excessive)
 - Protective rubber chemical apron

7.10 Tools

Hand Tools

Always use the right tool for the job and make sure it is in good condition before use. Handles of hammers and screwdrivers should be secure and if wooden, should be smooth without splinters. All tools must to be returned to their proper storage area after use.

Portable Power Tools

Power tools and their cables or power supply leads/hoses should be inspected before use. Any tools that are suspected of being faulty should have a Lock Out tag attached and sent for repair. Where guards are fitted to machines and tools for particular operations, these should be checked before beginning work. Tools must always be disconnected from their power supply when changing accessories or guards. Electrical tools or apparatus should not be used in wet conditions.

Electrical leads and pneumatic hoses should be kept clear of sharp edges and hot surfaces, or anything else that might damage them. If leads and hoses have to pass through doorways, the doors should be secured open. Where leads trails across decks or passageways, they should be suspended high enough, wherever possible, to allow clearance for personnel passing beneath.

7.11 Housekeeping

Housekeeping

Good housekeeping in all places of work is essential for the prevention of accident, injuries and fires. Everybody is individually responsible for good housekeeping.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 106 of 182

Attention should be paid to the following:

- Desks, benches, tables, floors and deck should be kept clear of accumulations of unneeded material. Tools, parts, rags, papers etc. should be kept tidy and in their correct place.
- Flammables should be stored in designated lockers ensuring that all NO SMOKING signs are in place.
- Ropes, Chains, wires, electrical leads and hoses should be stowed or secured so as not to cause a trip hazard.
- Spilled oil or grease should be cleared up immediately so that they do not cause a slip hazard. Keep rags and paper used to clean up oil spills in a separate bag, and store in a safe place, as it may be inflammable.
- Keep alleyways and access areas clear of accumulations of stores and equipment, which might hamper evacuation in emergencies.

7.12 Boat-To-Boat Transfer

Fuel, Personnel or Item Transfer Between Vessels

Personnel

Personnel Performing Operation : Masters/Party Managers/Safety Officer, Seaman/Observer

Minimum Number of Personnel : Six (6)

Duties : 1–Master (of each vessel)
2–Line Handler
1–Operation Observer
2–Operation Assistants

Supervision : Master/Safety Officer

Job Safety Analysis : Safety Officer/Party Manager

Personal Protective Equipment

Minimum P.P.E. Required : PFD, LifeLine, Work Boots, Hard Hat

Recommended : Work Gloves

Overview

On occasions, transfer of fuel, personnel or supplies will be conducted, at sea, between two boats. This operation will only be carried out with the consent of both vessels' Masters. Consent will only be given if the weather conditions and visibility are suitable to complete the operation safely. All such processes will be conducted during daylight hours, unless prevailing conditions indicate an increase in risks. Transfer of personnel is to be performed via the workboat or FRC only, direct transfer between the Veritas Viking II and an alongside support vessel is prohibited.

For all transfers of fuel and cargo a minimum of one crew member from the Veritas Viking II shall be onboard the supply vessel to oversee operations.

Potential Hazards

- Collision
- Fire
- Communications Failure
- Man Overboard

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 107 of 182

- Mooring Failure
- Falls / Trips
- Entanglement
- Spills
- Inadequate Hose Length
- Inadequate Control of Fuel Hoses
- Personal Injuries
- Punctured Hoses
- Loss of Steerage/Propulsion
- Damage to Reputation

Preventative Measures

- Briefing of all personnel prior to operation.
- Masters of each vessel to agree on process.
- JSA (Both vessels)
- Communications maintained throughout the process.
- Suitable Fendering as required.
- Fire appliances made ready.
- Use of additional protective equipment as the conditions merit.
- Certified /Inspected Hoses of suitable length.
- Suitable mooring lines with redundancy on each line.
- Control of moorings during the process.
- Lanyards.
- Dry Break Couplings.
- Oil Spill Response Equipment.
- SOPEP Guidelines.

Standard Operating Procedure

The Master or person designated in overall charge of the transfer operations should be agreed and clearly identified prior to the start of the operation.

The actual cargo or personnel transfer should be carried out in accordance with the requirements of the receiving ship. In all cases the Master of each vessel remains responsible for the safety of his own ship, its crew, cargo and equipment.

The only time two ships/vessels shall come alongside each other during hour of darkness is if there is a life threatening situation onboard either ship.

Manning and Duration of Operations

Each Master should take into consideration the estimated duration and the particular requirements of the operations to ensure that adequate manning requirements can be maintained throughout the operations.

COMMUNICATIONS

Satisfactory Communications including common language.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 108 of 182

Backup frequencies to be agreed ahead of time in case of external interferences.

All personnel to be aware of various audible sound signals with regards to breakdown of communications

Satisfactory communications between the ships are an essential requirement for successful transfer operations.

The ships should establish initial contact by radio as soon as practical to plan the transfer.

Communication During Approach And Mooring

Radio contact should be established on VHF Channel 16 at the earliest opportunity, thereafter to a mutually agreed channel. Approach, mooring and unmooring should not be attempted until fully effective communications are established. Officers responsible for mooring stations should be provided with portable hand-held transceivers.

Communications During Transfer Operations

Essential personnel on both ships involved in the transfer operations should at all times have reliable means of communications such as portable hand-held transceivers.

Breakdown of Communications

A total breakdown of communications on either ship while she is maneuvering should be indicated immediately. The approach operations should be suspended and the action taken to abort the maneuvers should be indicated by the proper sound signals prescribed by International Regulations for Preventing Collisions at Sea. Operations should not be resumed until full communications have been re-established.

CONDITIONS AND REQUIREMENTS

Weather Conditions

It is impracticable to lay down the limits of weather conditions under which transfer operations can be carried out because much will depend on the effect of the sea and swell on the fenders and the movement produced in the participating ships, taking their relative free boards. Throughout the berthing operation the visibility should be good enough for safe maneuvering, taking into account collision avoidance. The operation should only take place if both Masters are satisfied that conditions are suitable for berthing and personnel/cargo transfer.

Navigation Warnings

In all areas outside the jurisdiction of any coastal authority the ship in charge should broadcast a navigational warning to all ships advising:

- 1 Name and nationality of the ships involved.
- 2 Lat & Lon of the operations.
- 3 Nature of operations.
- 4 Time of starting of operations.
- 5 Expected duration.
- 6 Request for wide berth.

On completion the ship in charge shall cancel the navigational warning.

Navigational Signals

At the start of the approach by ship to the other, both ships should display the appropriate signals required by international or local regulations, and keep them displayed until the operation is completed and both ships have separated. The lights and shapes to be shown by ships engaged in ship to ship transfer operations are those required by the **International Regulations for**

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 109 of 182

Preventing Collisions at Sea, 1972, Rule 27b, or any subsequent amendments, and/or local port regulations.

PRE-MOORING AND PREPARATIONS

Safety Precautions during re-fueling

The following safety precautions should be taken:

1. Fire main tested and kept under pressure.
2. Water spray nozzles tested and ready to use.
3. Two additional fire hoses connected and ready for immediate use.
4. All access doors to accommodation to remain closed at all times during transfer operations, except those authorized by the Master for personnel transit or loading/unloading operations.
5. Smoking regulations to be enforced, and general announcement of process over vessel PA.
6. First aid, protective clothing, safety clothing, breathing apparatus, respirators and resuscitators to be ready for use.

Fenders

Fenders should be rigged and positioned according to an agreed plan, taking into consideration the length of each ship, the parallel mid-body distance and the position of the intake valves.

The general condition of fenders, including protection materials, mooring and shackles should be checked before mooring.

If fenders are secured in a string then each fender should also be secured with end lines of sufficient length and strength to allow the fender to move down the ship's side in the event of rolling.

Except in the case of very small vessels, when two primary fenders may be adequate, three fenders should generally be considered the minimum. When secondary fending is required, then small pneumatics, foam or hollow cylindrical rubber fenders should be used.

Thought should be given to the strategic positioning of fenders at the shoulder and quarter, having due regard to any differences in freeboard between the two vessels.

Moorings Preparations

Mooring lines from the ship coming alongside are normally used. Each mooring line shall be supported by mooring lines from the receiving vessel, thus having 100% redundancy should one line give way during the process.

The mooring plan should be agreed and understood between the ships and the crews briefed on mooring method.

The weather conditions and forecast should be confirmed as suitable for transfer operations.

Sufficient men on both ships should be allocated to mooring stations to handle mooring lines effectively.

During liquid transfers, the intake/discharge valves to be used should be clearly indicated to the each other vessel by flags or similar means.

General Precautions

During liquid transfers. Due to gear such as paravane ropes, outrigger booms, crane jib, etc.; possibly protruding beyond the ships side, it is essential that both Masters man their respective bridges. In particular, the Master of the fuel supply vessel must man the rudder and throttle controls at all times during the transfer in case the bow line(s) fails.

Both ships should be upright, and excessive trim should be avoided.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 110 of 182

Galley precautions and safeguards should be taken to ensure no hazards exist.

Lights and shapes should be ready for use.

All crew members should be informed of their emergency stations for the transfer operation.

At night the deck should be adequately lighted and if possible the ship's side should be spotlighted.

The cranes to be used should be rigged and ready for use.

MANEUVERING AND MOORINGS

Basic Principles

Experience has shown that the most successful method of berthing is with both ships underway. One ship, preferably the larger, maintains steerage way on constant heading as requested by the maneuvering ship, usually with wind and sea dead ahead. The maneuvering ship then maneuvers alongside.

Positioning of Fenders

Fenders can be placed on either ship, preferably on the maneuvering ship where they can be so positioned as to cover the anticipated areas of contact along the parallel body of the larger ship, irrespective of where contact may occur.

Where fenders are placed on the maneuvering ship, primary fenders should be positioned, one at each of the parallel body, with additional units in between if required. Secondary fenders should be positioned fore and aft of the parallel body where contact may occur in cases of misalignment during mooring and unmooring. To minimize the possibility of primary fenders riding onto the deck of either ship these fenders should be floating throughout the operation.

Mooring - (General)

Rapid and efficient mooring operations are essential for safe berthing, and can be achieved by good planning. Although individual Masters will have their own preference for the method of berthing their ship, the following points should be emphasized:

1. the wind and sea should be ahead or nearly ahead.
2. the angle of the approach should not be excessive.
3. the two ships should make parallel contact at the same speed with no stern engine movement necessary.

The effects of interaction should be anticipated when maneuvering at close quarters. Experience has shown that the best method of berthing is for the maneuvering ship to approach the constant heading ship from broad on the quarter on the side of berthing, then parallel her course about 50-100 meters off. The maneuvering ship should then match the speed as close as possible. Time must be spared for this matching of speeds, as it is important for the safety of the operation. The contact is then made by maneuvering, reducing the distance between the two ships by appropriate rudder movements until the primary fenders contact. The forward motion of the two ships driving the sea between them will tend to push the bows of the ships apart and it is therefore important to make fast the head and spring lines as soon as possible. Consideration should be given to the unmooring procedures when the mooring arrangements are discussed and mutually agreed between Masters. It is recommended that the final lines to be let go on unmooring should be turned between the bits.

The Masters of both ships should always be prepared to abort the operations if necessary. The decision should be taken in ample time while the situation is still under control. The Masters of both ships should immediately be informed of the others actions. The International Regulations for Preventing Collisions at Sea must be complied with.

Approach and Mooring

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 111 of 182

Both Ships Underway

When both ships are underway, the following should be taken into account:

1. Engine controls, steering gear and all navigation and communications equipment should be in working order.
2. A proficient helmsman should be assigned to steer the ship.
3. Speed should be controlled by adjusting engine revolutions or propeller pitch.
4. There should be effective communications between the bridge and each mooring gang.

Drifting Transfer

Providing conditions are suitable it is possible to carry out the transfer while drifting, but this should only be done in ideal conditions. In the event of both ships having to turn head to wind, consideration should be given to the windward vessel going astern on the engines rather than the leeward vessel going ahead on her engines. This should reduce the strain on the moorings during the maneuver. If deteriorating weather conditions are likely to cause the vessel to roll; they should be brought head to wind.

PROCEDURES ALONGSIDE

Pre-Transfer Procedures

When the ships are moored, the Masters of both ships should ensure that the checks and precautions as described in the checklist have been carried out and a safe condition has been established.

State of Readiness

The following arrangements should be made:

1. Both ships should be prepared to unmoor at short notice.
2. Fenders should be in the agreed positions and moorings sufficient and tendered at all times.
3. Extra lines and axes should be placed fore and aft on both ships.

Planning of Transfer

The planning of the transfer operation should include information on the following:

1. Type and Quantity of the transfer.
2. Initial transfer rate.
3. Maximum transfer rate.
4. Signal for slowing down transfer.
5. Signal for stopping transfer.
6. Emergency stop signals.
7. Ballasting and/or de-ballasting.

LIQUID TRANSFER OPERATIONS

Hours of Operation

All attempts are to be made to complete liquid transfers during daylight hours. However, there are many unforeseen conditions that may prevent the complete process to be finalized during daylight hours.

It has been assessed that with each time two boats come alongside the risks associated with this maneuver increase exponentially. Therefore, once all transfer equipment is in place and the transfer has begun, the transfer will continue until completed, unless weather conditions change or

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 112 of 182

safety and environmental factors increase. This may require the transfer to continue into hours of darkness, at which time all floodlights will be used to assist in visibility at the local site. Should such an increase in risk be experienced the process is to be halted immediately. The two vessels will separate, the risks are to be re-assessed, and the process to be re-commenced during the next available daylight period.

List/Trim

During transfer, ballast operations should be performed in order to avoid excessive changes in freeboard during the transfer and excessive trim by the stern. Listing of either vessel should be avoided.

Bridge Check

During the operation the bridge watch should check particularly the position of the ships, weather conditions, the approach of unauthorized craft, traffic in the immediate area and information from the shore.

Engine Room Checks

The engine room watch should be required to monitor and control the various aspects of the transfer and the ballast conditions. During the transfer operations the personnel responsible should ensure that the main engines are on standby, and the fire main is pressurized continuously.

Completion of Transfer

After completion of transfer the following operations should be carried out.

1. Radio broadcast canceling navigation warning on completion of transfer operation.
2. Side of transfer cleared of any obstructions, crane etc.
3. Method of disengaging and of letting go moorings agreed.
4. Fenders, including towing and securing lines to be in good order.
5. Power on winches and windlass.
6. Crew at stations standing-by.
7. Communications confirmed between ships.
8. Communication between mooring gangs.
9. Mooring gangs instructed to cast off only in the manner and when requested by the maneuvering ship.
10. Area traffic (shipping) checked.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 113 of 182

Fuel Transfer Checklist

Item	Comments	Y	N
Maritime Industry Standard Practice			
Owner has provided an accepted checklist.			
Both masters are aware of loa and grt of both vessels			
Both masters are aware of what speed that their vessel loses steerage			
Both masters are satisfied that mooring ropes, fairleads and bollards are in good condition.			
Both masters satisfied that suitable bollards and fairleads fitted for a spring line			
Both masters and chief engineers are satisfied that manifolds, hoses, connections, and lifting gear are in good condition and free			
Both masters are satisfied that the sides of the ships are clear of over hanging projections			
Both masters agree on a cancellation plan			
Both masters have established radio contact, agree on course speed exchanged and understood			
Language of operation agreed			
Rendezvous position agreed, clear of other traffic			
Both masters agree on a berthing and mooring approach and which ship will provide the mooring ropes			
Both masters satisfied that communication with mooring gangs satisfactory			
Both ships upright (no listing)			
Engines, steering gear and navigation equipment tested and found ok			
Stand by steering pump and generator on line			
Has weather forecast been obtained			
Fenders in place			
Crew briefed on mooring procedures			
Both masters agree on a contingency plan			
Master to notify local authorities and post a navigation warning			
Navigation signals displayed			
Both masters and chief engineers are satisfied with inter-ship communications			
Amount of fuel to be transferred agreed			
Chief engineer of receiving vessel has sounded the tanks and has identified which tanks to fill, max 80% capacity			

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 114 of 182

Both chief engineers agree on pumping rate and procedures			
Pumping vessel has a remote stop button for the transfer pump located close to the manifold			
Both chief engineers agree on a plan to stop			
Both chief engineers or their nominated person are in visual and verbal communications during the operation			
Both masters and chief engineers satisfied that their is no client interference			
Veritas DGC Requirements			
Job Safety Analysis completed with Master and Engineers			
Inter and Intra vessel communications established and operational			
Establish communication system (inter and intra vessel) in case electronic communications fail			
Confirm weather conditions and outlook for next 12 hour – 24 hours			
Establish rendezvous point (lat and long)			
Receiving vessel Engineer to nominate suitable observer to transfer to supply vessel			
FRB/Workboat to transfer nominated person to supply vessel			
Both masters confirm docking plan			
Mooring lines doubled up			
Transfer hoses handled between vessels via mechanical means			
General announcement over vessel PA that bunkering to proceed			
General announcement over vessel PA that NO SMOKING onboard until Bunkering is complete			
Oil Spill Kits on both vessels at the ready			
Fire hoses on both vessel primed and readied			
FRC/Workboat crews on standby			
Once bunkering commences normal refueling procedures to take effect			
Once bunkering complete drain fuel hose into lowest tank by way of raising dry coupling to suitable high point			
Once all fuel is drained secure all equipment and check soundings			
Compare receipts with supply vessel			
Masters to agree vessels can part			
Release mooring lines on Masters command			

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 115 of 182

Vessels separate and resume normal duties			
Master to cancel navigation warnings			
Master to notify appropriate authorities bunkering complete			
Supply vessel to have both main engines running for duration of process			

PERSONNEL TRANSFER OPERATIONS

Personnel transfer between vessels is only to be performed via the workboat or FRC. Transfer at sea directly between a Viking class vessel and a support vessel whilst secured alongside is prohibited. Persons being transferred should not carry baggage or cargo, this should be passed across by hand, or with the use of a crane or hoist.

Transport of Equipment/Personnel

Transport of equipment using the Workboat or the MOB boat is not the preferred method of transfer and should be considered only when the vessels cannot complete a boat-to-boat transfer operation. Personnel transfer is not permitted between the Veritas Viking II and a support vessel and as such the Workboat or FRC is to be utilized.

The mission is restricted to good weather and limited to the transport of small lightweight goods or personnel. Cargo nets are prohibited but plastic bags designed and certified as lifting appliances (Salt sacks) can be used when the support vessel has a crane.

1. Evaluate the weather.
2. Plan the mission in respect of the following
3. Weather conditions.
4. Type of cargo and quantity
5. Crane position and functionality on the support vessel.
6. Crane position and functionality on the Seismic vessel.
7. Boarding area of the support vessel.
8. The use bowlines when alongside.
9. Communications.
10. Daylight hours.
11. PPE.
12. The position of the mother vessel during the operation. Is it in a turn during the mission?
13. Do not exceed total cargo weight or personnel capacity of the small boat.
14. Complete the toolbox meeting and get permission for the planned mission.
15. Instruct the support vessel about the plan.
16. Abort the mission if the weather is unsuitable or the crew is unable to safely complete the task.
17. Get alongside the support vessel and deliver the plastic bags designed for lifting, if required send a crewmember onboard to advise the crew on the planned mission and how to organize with maximum load.
18. In the case of personnel transfer wait until the support vessel's deck crew and the small boat coxswain give permission to transfer. Only one person is to transfer at any one time. Once a person has transferred they should move away from the embarkation/disembarkation area and be ready to assist as directed.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 116 of 182

19. Use the crane to get the load down in the workboat.
20. Report to the bridge on the seismic vessel "Cargo onboard, heading back for offloading"
21. Use a bowline (adjusted to fit for the range of the crane).
22. Unload the cargo from the workboat.
23. Move forward and release the bowline.
24. Report to the Chase boat "Heading back to pick up the next load/persons".
25. Report to the Bridge on the seismic vessel "Mission complete, heading back for retrieval".

7.13 Waste Management

Overview

Only certain waste is suitable for overboard disposal, as indicated in the following guidelines.

All waste is to be separated and measured (weight) for tracking according to ISO 14001 Guidelines.

General waste from around the ship including food and galley waste, plastic or plastic products such as Styrofoam cups, plastic bags, tape, line and paper waste should be bagged and placed in the deck containers for disposal in the ship's incinerator. If incinerator use is not available, this refuse is to be stored for disposal ashore. Plastics suitable for recycling should be stored separately and if the shore disposal service has a facility to handle this product then they should be informed accordingly.

Domestic waste (i.e. cans) should be separated, compacted and stored in the deck containers for disposal ashore. Again if a facility exist ashore for items able to be recycled, then these items should be separated.

Maintenance waste (i.e. paint, rags, deck sweeping, oil soaks, machinery deposits, etc.) should be disposed of in designated deck containers as may be appropriate. Oily wastes in the form of filters should be in drums and kept separate from the other waste, so that it there is no hazard caused from seepage. This type of waste will have to be disposed of separately from the regular garbage.

All batteries should be stored onboard and disposed of according to the manufacture's specifications. A separate section of this document deals with the disposal and handling of Lithium batteries.

All sewage wastes should be treated in the vessel's sewage treatment facility, according to all applicable international and local government standards, before being transferred to the supply vessel for disposal ashore.

Food and cooking waste are the only items allowed to be dumped overboard. This type of waste disposal should not occur when the vessel is within 12 miles of a charted reef or coastline

Waste oils and oily water is to be contained in the waste oil tanks and pumped ashore or to the supply vessel, before final shipment to an approved disposal contractor.

Prior to entry into any port, the vessel supervisor should be informed of the type, nature and quantity of any waste that is required to be disposed of.

The drip tray under each streamer reel is drained to the waste oil tank. The valves should be closed during streamer recovery and during periods of bad weather, to prevent the waste oil tank being filled with seawater.

7.14 Hazardous Substances

Introduction

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 117 of 182

The term "hazardous substance" is one frequently used to describe any substances that have the potential to cause harm to people or the environment. This term is favored to describe such substances as it encompasses not only chemicals but also other goods not usually considered to be chemicals. It is a virtue of their toxic, flammable, explosive, corrosive, carcinogenic or radioactive nature that these substances are deemed to be hazardous or able to create a hazard.

The need for comprehensive control of hazardous substances is paramount in limiting employee exposure, providing for safe handling and disposal procedures and preventing any damage to the environment.

Hazardous Substance Control

All hazardous substances will be investigated for known hazards prior to their purchase and use in the workplace. Information will be obtained on the potential and requirements for protection against acute and chronic hazards. This information will be sought from suppliers and will be supplemented from other sources as necessary. Hazardous substances may not be purchased, supplied or used unless such information is available.

Hazardous substances, on the Veritas Viking 2 operation, are stored in the "Paint & Chemical Lockers". This is a controlled area and access is limited to authorized personnel. The Chief Navigator updates the MSDS manual and Hazardous Chemical Register, and copies are found inside the Locker. Personnel are required to consult these publications when using Hazardous Substances, ensuring that all safety instructions are followed.

Hazardous Chemical Register

The On Board Safety Officer will keep a Hazardous Chemical Register and Vessel Supervisor, on all hazardous substances used within the vessel. The intention of this register is to ensure uniformity in the supply of hazardous substances and limit products, where possible, to one brand.

Purchasing

Purchase requests for hazardous substances are to be forwarded to the Vessel Supervisor. It is essential to limit the number of hazardous substances available in the workplace, by assessing those already on hand, before ordering latest brand products, which have the same application.

Chemical products may not be purchased unless they are packaged and labeled as a minimum, in accordance with legislative and National Code of Practice requirements. Material Safety data Sheets are to be obtained prior to the purchase of the hazardous substance. Copies of the material Safety Data Sheet are to be filed in the Hazardous Chemical Register.

Where it is necessary to purchase hazardous substances locally to meet operational requirements, the person in charge is to first contact the Vessel Supervisor who will ensure that the product to be purchased is safe for its intended use. Due consideration is to be given to only purchasing existing products used by the Company.

All purchase orders are to be endorsed "Materials Safety Data Sheet Required", thus ensuring those persons handling hazardous substances have immediate access to the necessary information.

The Organogram at the end of this section depicts the purchase and supply of Hazardous Substances.

Material Safety Data Sheets

Material Safety Data Sheets are to be obtained for all hazardous substances used in the vessel's area of operation. Copies of these sheets are kept by the Safety Officer, and a copy of the MSDS manual is available to all onboard, in the Safety Library as well as in the "Paint & Chemical Locker".

When re-ordering the hazardous substance the supplier is to be requested to provide a known brand, of which the Material Safety Data Sheet are held onboard. Any substitutions of known

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 118 of 182

products should have the Material Safety Data Sheet attached. No product should be accepted for use until Material Safety Data Sheet is received onboard

Personal Protective Equipment

The availability or the need to supply the necessary Personal Protective Equipment is to be considered when ordering the hazardous substance. If necessary P.P.E. is not available onboard, then the Vessel Supervisor or Safety Officer will order the P.P.E. and supply it at the same time as delivery of the hazardous substance.

Where required, training in the correct use, fitting maintenance and cleaning of equipment will be given to personnel. When it is not clear what P.P.E. is required, the HSE Department will be contacted for advise.

Training

When personnel are not clear as to the use of any Hazardous Substance, then the Safety Officer will give them instruction. These instructions will include the correct use, handling stowing and disposal of hazardous products, along with Instruction to cover interpreting Material Safety Data Sheets, use of Personal Protective Equipment and emergency procedures.

Emergency Procedures

Before using any hazardous substance consideration is to be given to the emergency procedures to be used in the event of spillage, fire, pollution or injury to personnel. Personnel who handle, or could become affected by the hazardous substance, are to be informed of the hazard potential and the procedures for safe handling, minimization of exposure, emergency and first aid.

Incidents involving sufficient spillage, or injury to personnel are to be reported in accordance with the vessels accident reporting system and client requirements.

Safe Handling

The major objective of Safe Handling is to protect the health and safety of those working with these products and to prevent environmental damage, such as pollution of air, water or soil. The aim is to ensure that the safe handling procedures are both known and understood by all concerned. All hazards are kept onboard must be correctly registered and labeled to indicate the general nature of the risks.

Safe handling includes transportation, storage, use and disposal of hazardous substances. Certain products should not be transported or stored together, refer to the Material Safety Data Sheets for further information.

Hazardous substances must not be transferred into unlabelled or unsuitable containers. Substances with labels missing or illegible should be disposed of.

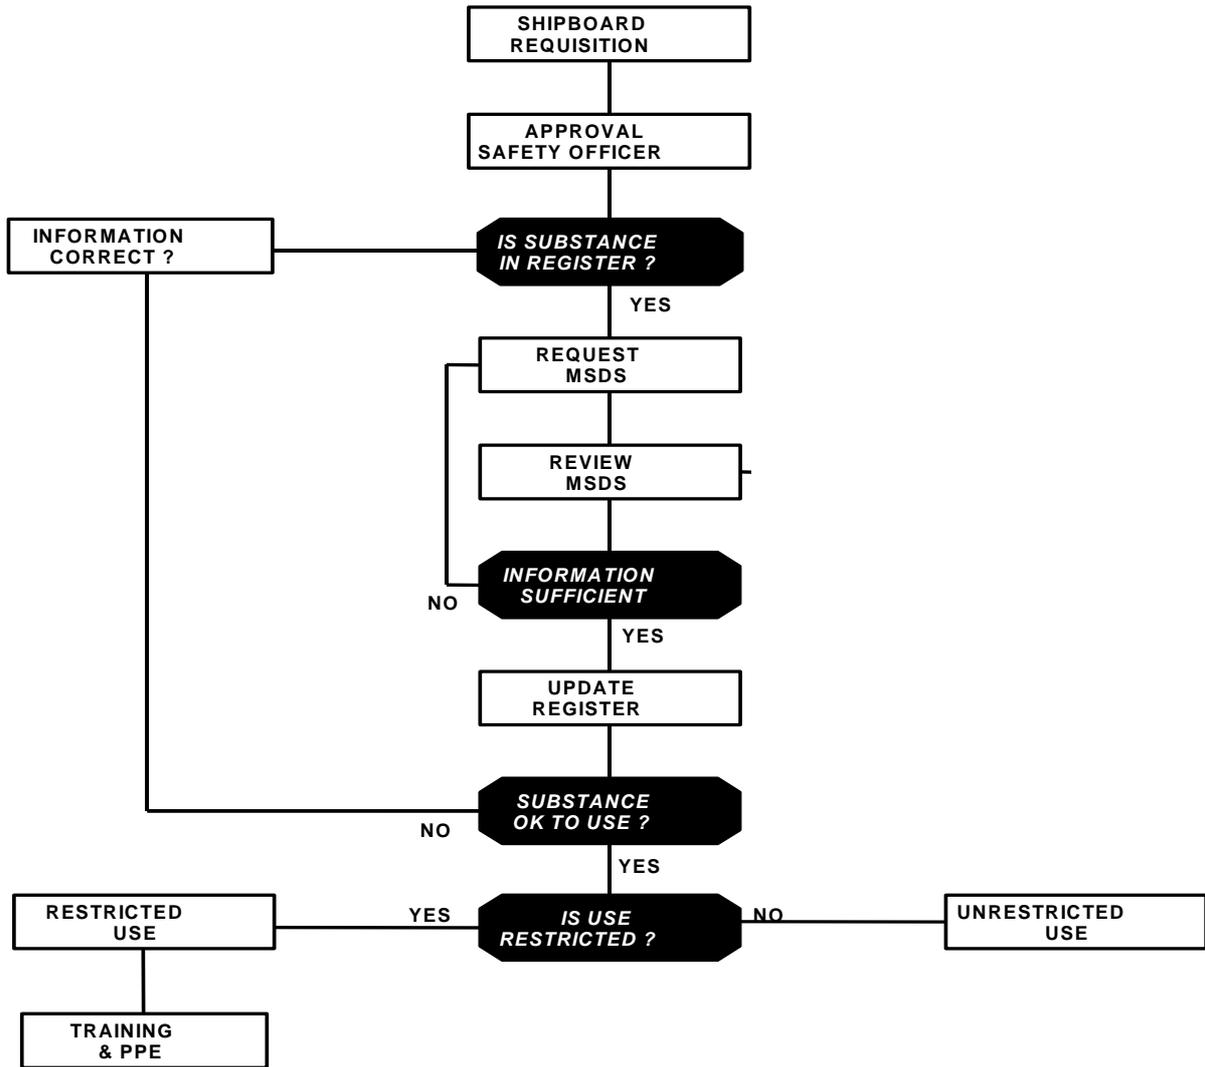

Figure 20 Purchase and Supply of Hazardous Substances

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 120 of 182

7.15 Equipment Purchase

Purchasing of Equipment

Request for Purchase

All purchasing requests for supplies, new equipment or plant are supplied to the Vessel Supervisor using the standard requisition format.

Usual consumable supplies are requisitioned, in the usual format, giving quantity, brand names and part/stock numbers, to ensure that the correct product is supplied and the quality is assured. Substitute products, may be similar in appearance, but could be of sub-standard quality, they will therefore be subject of scrutiny by the field crew prior to being accepted into inventory. Wherever possible known brand products should be used. All consumable supplies are subject to approval by the Vessel Supervisor, and then processed through the Purchase Order system, and when it is necessary for nominated persons to purchase item locally they must liaise with the Vessel Supervisor and or Party Manager, to ensure preferred items only are purchased.

Other, non consumable items such as tools, electronics, plant or equipment will be forwarded to the Vessel Supervisor, detailing the product/s required and reasons for the requisition of the said items. Tools that are replacements for lost or worn items will be supplied through the normal process, however they are considered non-consumable.

The Vessel Supervisor is responsible for gaining Application For Expenditure (AFE) approval from Regional or Head Office Management for the purchase of non-consumable items. To gain approval, three quotes from reputable contractors are required to be submitted with the application. The quotes are required to have specific details on description of items being purchased, price and terms, guarantees, service intervals and service centers available and installation or commissioning details. The Vessel Supervisor will submit the AFE request to the Acquisition Manager giving recommendations based on quality, service and application of item.

The Acquisition Manager is responsible to ensure that the application of the item has been assessed by the Marine Technology Group, Marine Operations and Field Service Departments for operational use, and the QHSES Department for risk assessment, and that correct measures are in place for the commissioning of the item. Preferably the item will have been field tested prior to going into field operations. Approval by the Acquisition Manager is forwarded to the AFE Committee for final approval.

Vessel Supervisor is responsible for ensuring only approved plant and equipment is obtained, installed, commissioned and maintained to the manufacturer's recommendations. The vessel owners are responsible to ensure that all Class regulations are met and that the authorities are informed.

Use of Equipment

When new plant or equipment is purchased, the item will have been assessed to ensure that it can be used safely and without creating an unacceptable risk to the health of the personnel or damage to the environment. Manufacturers and/or suppliers are required to supply the necessary information, which will allow the purchased item to be commissioned and used safely. Due consideration will be taken into account for the ergonomic use and the environment in which the equipment is used.

Where the item/s being commissioned are for a new application, a Hazard/Risk Assessment will have been completed. The Master or Party Manager are responsible for ensuring that a Tool Box meeting is conducted prior to the operation of the new product or item, and the Hazard/Risk Assessment is reviewed and that a Job Safety Analysis is prepared. New Procedures are to be written and provided to the Vessel Supervisor who will ensure that all applicable publications are revised and distributed.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 121 of 182

Re-ordering of Equipment

A particular item, which has been used previously within the vessel's area of operations, will not require re-assessing at the time of purchase. However the person purchasing the equipment is to ensure the product specifications and work environments have not changed.

Any new equipment not previously used on the vessel will require an assessment as to the suitability of the equipment for the task it is required.

Equipment Records

Records of plant and equipment purchased are to be added to the various inventories onboard the vessel. A copy of which will be forwarded to the Vessel Supervisor. Department maintenance records will be updated with the inclusion of the new item or equipment.

Disposal of Equipment

Before any equipment or plant is disposed of, the responsible person for the workplace will consult with the Vessel Supervisor to ensure that legislative and company requirements are met.

Modification of Equipment

Modifications to any item, product or plant must have the approval of Management so as to ensure that the risks have been analyzed, and correct measures and procedures have been adhered to.

7.16 Job Safety Analysis (JSA)

Overview

Veritas DGC recognizes that it is their responsibility to provide a safe place of work and a safe system of work. All tasks that present a potential for injury, minor or serious, damage to property or equipment or loss, must be analyzed to ensure that they can be performed safely and effectively.

The Geophysical Operations Procedures gives an outline of all geophysical tasks performed on this vessel and a minimum number of personnel required for each task. These procedures cover the Job Safety Analysis for each task performed. It is the responsibility of the Party Manager to ensure that there is sufficient experienced personnel to perform these tasks and that trainees or inexperienced persons are supervised correctly.

When occasions arise that no Job Safety Analysis is available for a certain task, a Tool Box Meeting will be held with the persons to perform the task. The purpose of this meeting will be to review the Hazard Register to ascertain if the task has been analyzed for risk, this will aid personnel to compile the Job Safety Analysis and safely complete the task. Completed Job Safety Analysis forms, approved by the Party Manager or Master should be passed to the Safety Officer for preparation of new procedures to be inserted in this manual.

Procedures are continually being monitored by all persons onboard. Whenever certain procedures need to be revised, a Tool Box Meeting will be held by the personnel performing the task. Procedures are also reviewed after an incident has occurred, in the form of an incident investigation and follow up report. These investigations and reports are completed using, but not limited to, the VIMS Incident Report form.

7.17 Tool Box Meetings

Overview

A Tool Box Meeting is a term derived for a safety briefing required when a noticeable incident, which has serious potential occurs, or a particular task presents a hazard to those involved, or a task is to be undertaken that is out of the ordinary or not covered by any written procedure.

The Master, Party Manager, or task supervisor are responsible for arranging these meetings as required and a record of the information discussed is to be kept at the workplace.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05

7.18 Management of Change

Introduction

Management Of Change System

Management of change is a system, which manages the risks associated with changes to the operations or procedures. It is a formal system, which attempts to address the issues and risks associated with a change to the existing 'accepted' practices.

The Management of Change system aims to identify the risks associated with these changes and to introduce control measures that may be required to eliminate or reduce the risks. It provides a documented route to the reduction and elimination of risk and ensures that due consideration has been given to ensuring that the outcome is concurrent with the aim.

Changes to equipment, processes, procedures or personnel, are to be thoroughly considered and tested before they are implemented. Managing and monitoring change is critical to safe and environmentally sound operations.

The elimination or reduction of reportable incidents measures the effectiveness of a Change Management System and it can work only if supported by an effective 'risk assessment and reporting and investigation procedure'.

The system should address:

- Authority for the approval of changes.
- Analysis of HSE implications.
- Compliance with regulations and approved standards.
- Acquisition of necessary permits.
- Documentation, including reasons for change.
- Communication of potential consequences and required compensating measures.
- Duration of the change and any time limitations.
- Training, identified as a result of the change.

Implementation

A Documented Management of change system will be developed by Veritas DGC, and will be implemented when it has been deemed necessary to 'deviate' from the accepted or approved operation or procedure.

Deviations or changes to existing practices will only be implemented if it is deemed 'critical' to the operation and will not be introduced until the formal processes of 'Management of Change and Hazard Assessment', have been documented and approved by the appropriate Management Representative. This will be achieved by carrying out a **vessel based, hazard analysis and risk assessment** of the proposed change and documenting the results in a log incorporating the attached 'Management of Change Form'. Assessments of this type will be conducted by senior crew-members and supervisors and in accordance with line management protocol and will include the Client Geophysical Representative, on board the vessel if required.

Change Management Requirements.

Formal management of change assessment may be required in the following circumstances, if there is considered to be an impact on HSE :

- Changes to the modes of operation or scope of work. (e.g. 2d to 3d, helicopter operations, chase vessel utilization, etc.)

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 123 of 182

- Changes to the area or duration of the operation, with regard to the effect on Regulatory compliance, weather, environmental impact, proximity to rigs and other shipping activities.
- Changes to procedures, which introduce New hazards or risks.
- Changes to procedures, which remove existing controls.
- Changes to existing operations or procedures where it has been found necessary to introduce new control measures, either as the result of accident, injury or near miss, or where a new hazard has been identified.
- Changes of key personnel or persons who are unfamiliar with the operation or procedures and associated risks.
- Changes to existing equipment, which may introduce aspects, associated with the above requirements.

Where it has been identified that Management of Change is necessary the processes and considerations outlined in paragraph 1 and 2 of this section shall be followed.

7.19 Notification of Project Completion

Introduction

This procedure is to enable all parties to have a clear understanding of the completion of one project and the mobilization to the next project. This notification will enable the HSE Department to notify International SOS of the proposed transit plan from one site to the next.

Description

As a survey/project approaches completion, the Master will submit a transit plan to the Marine Supervisor, and the QHSES Coordinator. This shall be completed no later than 48 hours prior to completion of the current project. The QHSES Coordinator will forward this information to International SOS, to bring to their attention the vessels movements until the start of the next project.

Transit Plan Detail

The plan shall contain at a minimum but not be limited to the following;

- Starting Lat., and Long.,
- Estimated Lat., and Long. for each 24 hour period,
- Possible emergency evacuation ports along the transit route,
- Any surmised areas of piracy,
- Any envisaged hazards along route.

Conclusion

By having such a plan posted to the Vessel Supervisor, HSE Supervisor, and International SOS, Veritas will be able to monitor the general progress of the transit, and International SOS will be able to readily offer suitable assistance in the event of possible medical advice, and a suitable evacuation plan.

7.20 Electrical Safety

Introduction

Working with, in, and around electricity is one of the single most dangerous hazards we face each day. Positive isolation of electrical equipment is essential when working on any type of electrical equipment onboard the vessel. Without such isolation electrical injuries that could occur include;

- shock,
- electrocution, and
- electrical burns.

Most accidents involving electricity result from:

- Not isolating the electrical supply, and or
- Working on live electrical equipment.

Safe Systems of Work

General precautions for working with electricity involve a combination of insulation, earthing and isolation. Other precautions should include:

- Portable power tools being grounded or double insulated.
- Double adapters are prohibited.
- Immediate removal of equipment with frayed or damaged electrical leads from the workplace for repair.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 126 of 182

- Systems of isolation and tagging procedures are in place. Tagging and lock out prevents someone unwittingly turning the power back on while an electrician is working on a piece of equipment.
- Only cordless or air powered tools are used in damp or wet conditions.
- Metal ladders are not used for electrical work.
- Electricians wear correct clothing such as insulated safety boots.
- All electricians are trained in first aid treatment for electric shock.

General Procedures for Electrical Work

1 Prepare for shutdown.

Contact involved individuals, Chief Engineer, Compressor mechanic, Technician. Make sure everyone involved is aware item is to be removed from active use. Depending on Severity this could also involve making sure the appropriate fire extinguisher/safety equipment is on hand and area cordoned off to insure no one comes into contact with unit.

2 Equipment shutdown.

Turn off unit following normal operating procedure. If unit has been turned off using an emergency shutdown procedure insure all equipment switches are returned to the off position.

3 Equipment isolation.

Determine Power Source and Isolate. This could be as simple as unplugging the device to turning off breaker and removing buss fuses.

4 Lockout or tagout application.

Ensure electrical source is properly tagged out. In case of unit with plug insure plug has been tagged so no one will try and plug unit back in.

5 Release of stored energy.

In the case of most items, electrical energy can remain stored internally after power is removed. ie UPS, Monitors. Follow the individual units maintenance manual for proper procedure for releasing stored energy. Be aware that some units release stored energy through ground and if isolated may not be able to release the energy.

6 Verification of isolation.

Measure using appropriate meter to insure power has been removed from unit. If possible insure unit is physically disconnected before servicing.

What to do in the event of an electric shock.

When discovering someone who has suffered an electric shock:

- Get someone to call for immediate assistance,
- Turn off the source of the power to faulty equipment;

If this is not possible try to remove the person from the source of the power by using a non-conductive material:

- pull them with a dry rope;
- push them with a piece of dry wood or plastic tube;

On voltages 1000 V or more do not approach closer than 1.5m.

Once the person is removed from the source, check their breathing and if they are not breathing

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 127 of 182

commence Expired Air Resuscitation (EAR). Check for a pulse and if there is no pulse commence cardiopulmonary resuscitation (CPR). For electrical burns, apply a cold compress and seek medical attention.

7.21 Noise Management

How Does It Affect Me?

Excessive noise destroys delicate nerve cells in the inner ear that transmit sound messages to the brain. The nerve cells are replaced by scar tissue that does not respond to sound. The damage is painless but permanent and there is no cure. Hearing aids are of some help but cannot restore normal hearing.

Noise mostly damages the parts of the inner ear that process high frequency sound. The result is noise-induced hearing loss, mainly affecting hearing for high frequency sounds rather than low frequency sounds. Because you can't always hear what's going on around you if your hearing is impaired, you could miss a warning sound or a cry for help, or misunderstand an important message.

As well as impaired hearing, people exposed to excessive noise may also suffer from 'ringing in the ears'. This can be very distressing, especially if you are trying to go to sleep.

You may think "I'll notice if noise is affecting my hearing and I'll do something about it then". Unfortunately, you probably won't notice. Noise-induced hearing loss develops slowly and painlessly and you probably won't notice it has happened until quite a lot of hearing has been lost.

What's The Problem?

The ability to hear is one of our most precious gifts. Without it, it is very difficult to lead a full life either on or off the job.

If sounds and noises are too loud they can permanently damage your hearing. The danger depends on how loud the noise is and how long you are exposed to it. The damage builds up gradually and you may not notice changes from one day to another, but for most effects of noise, there is no cure. So preventing excessive exposure to noise is the only way to avoid hearing loss.

How Do You Know If Exposure To Excessive Noise Is A Problem In Your Workplace?

There are two main factors that determine whether noise is harmful - how loud the noise is, and how long you are exposed to it each day. Noise starts to be a risk to hearing when it is about as

loud as heavy city traffic (about 85 decibels). You can work all day in noise levels below 85 decibels with little risk of hearing damage. Above 85 decibels the risk increases rapidly as the noise gets louder. At 100 decibels, for example, exposure should be no more than 15 minutes a day.

What Needs To Be Done?

Veritas DGC have a duty to protect its employees and to keep them informed about health and safety matters.

There are various Occupational Health and Safety Commissions around the world that have declared a standard for noise in the workplace as 85 decibels, averaged over an eight hour working day. In general these standards also stipulate that noise in the workplace must never exceed 140 decibels at any time. Most countries have adopted this as a national standard. However, individuals should check with the Occupational Health and Safety Authority in their Country, State or Territory for the precise requirements for your workplace.

As an employee you have a responsibility to follow work safety guidelines and instructions.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 128 of 182

To protect your hearing you should as a minimum:

- use noise controls supplied with machinery or installed in the workplace,
- report damaged noise control equipment and hearing protectors for repair or replacement,
- use hearing protectors in noisy areas, and
- order or notify your immediate supervisor of the need for noise controlling devices in your area of employment.

Practical Solutions

There are a number of ways to reduce people's exposure to noise. These include:

Quieting the source of noise:

- Designing equipment can make big noise reductions and work processes so they are not as noisy, for example, by lining metal chutes and bins with scrap rubber conveyor belting.

Stopping the noise from reaching people:

- This can be done by moving a noisy machine away from people, by building a soundproof enclosure around it or by putting up a barrier between machines and operators.

Reducing the time people are exposed:

- Where possible, people should swap between noisy and quiet jobs so that nobody gets exposed to noise for too long.

Wearing personal hearing protection when necessary:

- If noise exposure is still excessive after all possible control measures have been taken, individual protection like earmuffs or earplugs should be worn.

There are simple ways for you to judge if a noise is likely to be harmful. The best way is for a trained person to measure the noise, but generally speaking noise is likely to be harmful:

- when the noise is as loud or louder than heavy city traffic,
- if you have to raise your voice to speak to someone a meter away,
- when things sound different after the noise exposure,
- when you hear ringing or other noises in your ears after the exposure.

How you can contribute to reducing workplace noise levels:

- take a cooperative interest in workplace noise problems,
- help develop policies, plans and work practices for dealing with noise problems,
- suggest possible noise controls for the machines you know and operate,
- assist plant engineers or consultants develop design solutions,
- use noise control equipment supplied,
- take responsibility for the preservation of your own hearing by using hearing protectors whenever necessary.

Facts about hearing protection:

Some of the most commonly asked questions about hearing protection, and the effects of noise are discussed below.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Vessel Procedures.		Page 129 of 182

Is there any danger in putting earplugs in your ears?

Earplugs are soft and not long enough to reach far into the ear canal so it is virtually impossible to do any harm. However, if you have an ear infection or have ever had ear surgery, check with a nurse or doctor before using earplugs.

What if I don't wear hearing protectors all the time?

Taking protectors off even for short periods can cancel their protective effect. To be fully protected, you need to wear protectors all the time you are exposed to loud noise.

Is there any point in wearing hearing protectors if your hearing is impaired already?

Your ears will go on being damaged as long as they are exposed to excessive noise. The hearing you have left is very precious, and should be protected.

I won't be able to hear what people are saying if I wear hearing protectors.

Not so. If your hearing is normal you will find it easier to understand what people are saying when you wear protectors because your ears are no longer overloaded. The effect is like wearing sunglasses - you see better when the glare is cut down.

If your hearing is impaired, you may not get this benefit of being able to understand speech better when you wear protectors. Depending on the kind of impairment, you could find it harder to understand speech. If you have this problem don't give up the protectors - it's important to protect your remaining hearing.

Supplied Protection

Veritas DGC supplies various forms of hearing protection to its employees. If this protection is insufficient for your area of operations you will need to bring this to the attention of your immediate supervisor and the HSE department for correction and/or adjustments. The onboard Safety Representative will have various supplies held onboard at all times to assist in avoiding situations where the vessel runs low on this type of PPE. The HSE Representative will place orders with their supervisor to maintain a limited stock onboard at all times.

8.0 Safety Critical Geophysical Operations Procedures

8.1 Identified Safe Work Area

The deployment, repair, and retrieval procedures often take more time than originally planned. The Party Manager and Master shall discuss the survey area prior to arrival onsite, then review the conditions after the vessel arrives in the survey area.

Consideration is given, but not limited to, shipping traffic lanes, shallow water, production platforms and associated hindrances, fishing, and the potential for encountering anchored buoys and markers. It may be necessary to define areas not suitable or safe for Streamer operations. An area will be deemed suitable or safe once all the above mentioned considerations have been taken into account, and all associated risks have been reduced to as low as reasonably practicable.

A clearance distance of no less than two (2) times the maximum length of the towed equipment from any identified hazard is to be maintained during Streamer Deployment and Retrieval (and maintenance), refer to the section titled Turn Radius for tables, and Safe Work Area for a diagrammatical description.

These areas shall be drawn on the vessels navigational charts, located on the Bridge, as well as any survey charts deemed necessary. The co-ordinates shall also be entered in the seismic navigation system. Once the danger areas have been identified, they will be classed as **NO GO ZONES** and are **OFF LIMITS** whenever Streamer work is in progress.

The Officer of the Watch (OOW) is responsible for ensuring the ship operates outside of all no-go zones during Streamer work. The OOW will inform the Observer and Navigator at least two (2) hours, or five miles, whichever is greater, before the vessel reaches a prohibited area. If a suitable response is not received, the OOW will inform the Master and Party Manager and appropriate evasive action will be immediately implemented.

The Navigator is responsible for notifying the Bridge of any course changes with as much notice period as possible, however it is acknowledged that the nature of real-time operations sometimes necessitates quick real-time decisions. Consideration shall be given to the OOW, allowing him sufficient time to check all prospect charts for any hazards in the area, prior to the required course alteration.

If a situation develops that threatens the safety of the streamer or vessel, the Master and Party Manager will be notified immediately. Once notification has been given of an impending no go zone the vessel will be maneuvered clear of the area.

The Party Manager has the final responsibility of any loss or damage to the towed equipment, however, the Master is responsible for the safe passage of the vessel, and the vessels' actions in relation to other seafarers, and their equipment. He will therefore, take control of a hazardous situation, and control the vessel in whatever manner necessary to normalize the situation.

8.2 Streamer Paravane Deployment and Recovery

Streamer Paravane Deployment and Recovery Procedures

Personnel

Personnel Performing Operation : Chief Mechanic, Observers, Gun Mechanics

Minimum Number of Personnel : Five (5)

Duties : 2–Winch Operator
2–Deck Helpers
1–Operation Observer

Supervision : Party Manager

Job Safety Analysis : Chief Mechanic

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Hard Hat

Recommended : Hearing Protection, Work Gloves, Eye Protection, Back Protection, Work Vest, Tether Harness

Overview

The Streamer Paravanes are a device consisting of various wings or vanes designed to operate in undisturbed water. The forward motion of the paravane through the water forces the water flow through the series of vanes, thus forcing the paravane into a wide tow position.

The cable paravane is designed for the diverting of the cable(s) away from the ship. This enables the ship to tow more than one cable behind the vessel at a desired distance apart.

Potential Hazards

Failure of tow hardware: A steady load is required on all six elements of the Tow Harness to evenly distribute the force of the Paravane. If the force of the Paravane is distributed to less than six of the elements, or the load is not steady, the force on an element can easily exceed an element breaking strength. Loss of the Paravane is the immediate result; subsequent damage can also occur to the Sub-Arrays, and the Streamer. The weather and Sea State are the usual cause of failure. The upper limit has been determined as a Sea State 6 approaching a Beaufort force 7. All efforts must be made to limit the exposure of the Paravanes to inclement weather.

- Failure of winch line.
- The Paravanes are large and heavy.
- The equipment is under large loads.
- Marginal Weather and Sea conditions.
- Overdue Maintenance
- Tow rope from streamer bend restrictor to paravane tow rope going under vessel or caught up on protrusions.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Two personnel utilized to handle deployment and monitor operation.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 135 of 182

- Frequent and documented inspection, maintenance, and inspection of Tow Lines.
- Frequent and documented inspection of the Winches, Paravanes, Paravane Tow harnesses and hardware.

Special Precautions

- It is UNSAFE to deploy the Paravanes in deteriorating weather conditions.
- Avoid standing on the Paravane to attach or detach Tag Lines or repair hardware.
- NEVER allow the Paravane to remain near the vessel. Either deploy the Paravane away from the ship (100m if possible), or retrieve and store the Paravane.
- NEVER stand in the bight of a rope.
- NEVER stand astride a rope
- NEVER stand on the outboard side of the outer streamer spooling block during deployment/recovery operations.

Preparation Check List

The Chief Mechanic or Crew Leader will assign personnel to their duties and make sure that they are properly attired.

1. All personnel will wear Safety Footwear
2. All personnel will wear Hard Hats.
3. All personnel will wear Ear and Eye protection as appropriate or when directed.
4. All personnel near the stern will wear Personal Flotation Devices (P.F.D.) and a Safety Harness, when directed. Due to the Viking deck layout, there are no open areas. This equipment is necessary when moving to a height above the enclosed rail area.

Standard Operating Procedure

Prior to the deployment or recovery of the streamers and paravanes a clear plan of the work to be achieved must be understood by all concerned.

The Chief Mechanic or Crew Leader is in charge of deployment and recovery of the paravanes, in conjunction with the Observer who will be deploying or recovering the streamer simultaneously. Both operation operators will assign the work duties before deployment or recovery of streamers or paravanes.

Streamer Paravane Inspection

Check the conditions of the Paravane for:

1. Physical damage to wings and eyes.
2. All retaining nuts and bolts in good condition and tight.
3. Secure flotation buoy.
4. Plexus harness and associated hardware in good condition and tight.
5. Tow rope eye socket and tow chain is in good condition and the rope not frayed, or showing signs of fatigue.
6. Tag Line in good condition.
7. Tow Rope in good condition.
8. Clear communications with the streamer deployment team.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 136 of 182

Deployment From Side Of Ship Stowage

Check the present sea state and weather. Consult the local forecast. Combined sea and swell should preferable be less than 2.5 meters (8 feet) with weather pattern stable or decreasing, however a Toolbox Meeting or Job Safety Analysis should take into consideration the risk that the wind and sea conditions and the subsequent vessel pitch/roll/heave, pose to the operation, and if the risk is considered too great, the operation should be suspended until conditions improve.

1. Conduct the Paravane Inspection.
2. Notify the Bridge and Recording Room that Paravane deployment is to commence. State clearly which side the deployment will begin and ensure the ship's speed is correct, approximately 4.0 knots through the water.
3. Unhook the Paravane stowing chains.
4. Attached the Paravane tow line to the streamer Bend Restrictor.
5. Lower the tugger winch tag lines until the paravane is hanging horizontally by the main tow rope, then remove the tugger winch lines.
6. Lower the Paravane to the water in a fast, smooth manner until the Paravane is approximately 20m from the ship's side. At this point, the deployment of the paravane and streamer can be transferred to the Chief/Senior Observer
7. Continue to deploy Paravane in conjunction with the deployment of the streamer(s). See section 'Streamer Deployment', ensuring clear and precise communications with the streamer deploy team.
8. Once fully deployed notify Bridge and streamer deploy team, and disengage the remote hydraulic controls.

Recovery To Side Of Ship Stowage

1. Notify the Bridge and Recording room that Paravane recovery is to commence. Ensure the vessel speed is correct.
2. The Paravane and streamer have to be recovered simultaneously. Ensure the Streamer recovery team is prepared and clear and precise communications are established.
3. Paravane recovery is the reverse of the deployment procedure, keeping in constant communication with the streamer recovery team.
4. When the Paravane reaches the ship's side continue the winch operation until the Paravane is clear of the water and held fast to the ships side with the tow rope.
5. Attach the paravane lifting winch lines to the forward and aft tag lines and winch the paravane up to its horizontal stow position.
6. Detach streamer tow rope from the streamer bend restrictor.
7. Secure paravane with the stowage chains.

Recovery to Top Deck Stowage

Check the present sea state and weather. Consult the local forecast. Combined sea and swell should preferable be less than 2.5 meters (8 feet) with weather pattern stable or decreasing, however a Toolbox Meeting or Job Safety Analysis should take into consideration the risk that the wind and sea conditions and the subsequent vessel pitch/roll/heave, pose to the operation, and if the risk is considered too great, the operation should be suspended until conditions improve.

1. Conduct the Paravane Inspection.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 137 of 182

2. Ensure permit to work has been completed.
3. Notify the Bridge and Recording room that Paravane movement is to commence, and state clearly which side the movement will begin.
4. In any circumstances DO NOT pick up the paravane by the splice. The splice is not designed to handle the load in this manner, as there is a risk of the splice failing, causing the load to drop. Lifting the paravane by the tow splice, and leg splices is considered an unsafe act.
5. After initial retrieval to side of the vessel, the paravane is held horizontally to the shipside on the tow splice.
6. Attach the paravane lifting lines on the cable deck to the fwd and aft tag lines on the paravane and heave in until these are just under tension. (The weight remains on the towrope.) This is merely a safety back up.
7. Pay out top deck tugger winch ropes through the Panama fairleads and down the ships side to the bottom fwd and aft towing shackles and attach. Lower 2 x 6 metre 5Tonne lifting strops from the cable deck on a rope and attach using shackles to the same. Ensure the rope is held inboard at all times.
8. Heave in with the lifting winches situated on the cable deck until the paravane is held vertical to the ships side.
9. Attach 2 x 6 metre 5 Tonne lifting stops with shackles to the top fwd and aft towing points from the cable deck and hold inboard.
10. Pay out with the cable deck lifting winches and disconnect tag lines, simultaneously lowering the ships crane and attaching all lifting strops.
11. Heave in slowly on the ships crane and the top deck winches for restriction of movement, thus maintaining the paravane on a horizontal plain at all times during the operation.
12. Continue carefully until the paravane is clear and safely stowed on the top deck of the vessel.
13. Reverse the procedure for deployment.

Replacing Paravane Float

Check the present sea state and weather. Consult the local forecast. Combined sea and swell should preferable be less than 2.5 meters (8 feet) with weather pattern stable or decreasing, however a Toolbox Meeting or Job Safety Analysis should take into consideration the risk that the wind and sea conditions and the subsequent vessel pitch/roll/heave, pose to the operation, and if the risk is considered too great, the operation should be suspended until conditions improve.

Ensure the paravane is secured vertically to the side of the vessel with no apparent obstructions to hinder the smooth removal of the float.

Attach painter lines to the eye welded to the top segment of the four float bands. (This is for safe and easy lowering and lifting of the float band.)

Attach 2 x 6 meter x 5 Tonne lifting strops around the float, equally located for point of balance to obtain a level lift. Ensure top deck fwd and aft tugger winch lines are attached around the float for use as tag lines.

Lower ships crane and attach to both lifting strops, applying no additional pressure to the float. This is to avoid stress to the bands.

Remove all clamp bolts.

Gently lower the top segment of the float band using the painter lines situated on the top deck.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 138 of 182

When all of the bands are lowered, slowly hoist with the ships crane and tag lines, steadily maneuvering the float to the required position on the top deck and secure.

Reverse the procedure for deployment.

8.3 Streamer(s) Deployment

Streamer(s) Deployment Procedures

Personnel

Personnel Performing Operation : Observers/Gun Mechanic, Chief Mechanic

Minimum Number of Personnel : Four (4)

Duties : 1–Winch Operator
2–Streamer Handler
1–Operation Observer

Supervision : Party Manager

Job Safety Analysis : Chief Observer

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Hard Hat.

Recommended : Hearing Protection, Eye Protection, Back Protection, Work Gloves

MSDS

Cable Oil, Lithium Batteries

Overview

The Seismic Streamer is a towed cable used to record seismic signals produced in offshore seismic operations. The streamers are composed of sections, 150 meters in length, containing 96 equally spaced hydrophones mounted along the center axis. The streamer sections are either coupled together or connect into a digitizing module, located at the head of every section to digitize and relay the received seismic signals to the onboard recording system. The streamers are typically configured to lengths of between 4000 and 9000 meters of active sections, determined by specific contractual requirements. Each streamer is marked at the end by a tail-buoy equipped with GPS, while the depths are controlled using remote cable levelers or 'Birds'.

Work Area

The deployment and recovery procedures must be planned in detail between the Party Manager, and Master who must discuss the survey area prior to arrival onsite, then review the conditions after the vessel arrives in the survey area.

Consideration is given, but not limited to, traffic lanes, shallow water, production platforms and associated hindrances, fishing, and the potential for encountering anchored buoys and markers. It may be necessary to define areas not suitable for Streamer operations. An area is determined where it is deemed appropriate for Streamer work. These areas are drawn on the vessel area charts on the Bridge and Navigation, as well as any survey charts deemed necessary. The coordinates should be entered in the seismic navigation system. Once the danger areas are defined, they are OFF LIMITS when Streamer work is in progress.

The Bridge is responsible for ensuring the ship operates outside of prohibited areas during Streamer work. The Bridge will inform the Observer and Navigator at least 2 hours, or five miles, whichever is greater, before the vessel reaches a prohibited area. If a suitable response is not received, the officer of the watch will inform the Master and Party Manager.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 139 of 182

If a situation develops that requires the vessel, and or streamer, to be maneuvered clear of an obstruction, the Master will take charge, assisted by the Party Manager.

The Party Manager has the final responsibility of any loss or damage to the towed equipment. However, the Master is responsible for the safe passage of the vessel, and the vessels' actions in relation to other seafarers, and their equipment. He should therefore, take control of a hazardous situation, and control the vessel in whatever manner necessary to normalize the situation.

Potential Hazards

- Cable Oil is a solvent and can cause burns and irritation to exposed skin and eyes.
- Fire due to the low flashpoint of cable oil.
- Personnel are working near the stern.
- Marginal Weather and Sea conditions.
- Falls caused by slippery footing from water and spilled cable oil.
- Electric shock from cable DC power.
- Lithium batteries. (see section on lithium battery storage and handling)

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Two personnel utilized to handle deployment and recovery operation.
- Training on fire foam system use.
- Location of an eye wash station and shower near the Streamer Deck.
- Lith-X extinguisher for Lithium Batteries.
- Strict control of cable oil spills. Immediate clean up of spills.
- Good communication between the Recording room and the streamer team on the streamer power status.
- CCTV monitoring from Bridge and Recording room.

Special Precautions

- The Work Area is defined and confirmed by the Party Manager, and the Master, before any Streamer deployment operation commences.
- The Bridge will closely monitor shipping traffic in the area and notify the Instrument and Navigation personnel of any developing situation.
- The Navigator will monitor the course, and speed, and advise the Bridge and Streamer crew of any necessary course alterations during the Streamer operations. The Navigator is responsible for monitoring the water depth and setting the initial depth of the "Birds" during deployment.
- At ANY TIME a streamer section is disconnected or connected the streamer power is turned OFF. The Streamer crew calls the Recording room to turn the streamer power off via the intercom system. Verbal acknowledgment is REQUIRED after the power is off.
- The Streamer crew will advise the Recording room when the Streamer is reconnected; in order to immediately monitor the Streamer and conduct testing.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 140 of 182

- ANY cable oil spills are immediately cleaned from the deck, and personnel are to rinse any cable oil from their skin and clothing immediately.
- It is UNSAFE to deploy the Streamer in deteriorating weather conditions.
- Prior planning of the work to be performed understood by all involved before the Streamer is deployed or retrieved.

Preparation Check List (Checklist in Section 9 Miscellaneous Sample Forms)

Prior to any Streamer work a clear plan must be understood by all concerned parties. The Shift Leader must discuss the work with the Party Manager, possible resolutions for problems are discussed, and contingencies for probable difficulties are planned. This is achieved by way of a Toolbox Meeting.

The Shift Leader will assign personnel to their duties and ensure the duties are properly completed. He also ensures all personnel are wearing appropriate PPE for the task and conditions.

Prior to the deployment of any trailing equipment, the Observer will consult with the Bridge to determine if the deployment area is suitable for the task at hand, and the vessel's speed and direction are conducive for the operation.

The streamer check should begin with a review of the worksheets from the last recovery, i.e. defective traces, ballasting, holed or damaged streamer jacket, slipped bulkheads, low voltage batteries and defective levelers and acoustic pods.

The operational condition of the deployment, and recovery, equipment is checked well before any foreseen Streamer work is required. Directly prior to Streamer work the following equipment check is performed:

1. Cable reel and winch controls.
2. Communications equipment.
3. Life rings and fire extinguishers are in proper locations.
4. Streamer tools complete and ready.

Peripheral Equipment Checks

Tail-buoys

All tail-buoys are individually inspected before deployment takes place. The following items must be thoroughly checked:

1. All bolts tightened.
2. Antennae and associated peripherals such as regulators and radar reflectors are secured.
3. All shackles secured with locking wire.
4. All equipment attached to the tail-buoy secured with a safety wire.
5. Strobe lights are switched on.
6. Beacons are powered up on battery power and their respective ID's checked before connection to the streamer Stic cable.
7. Power cable or Stic cable inspected for damage to wire or pins.

Connection of Stic cable to the tail-buoy. Streamer power must be switched off, and connection only carried out once the recording room has confirmed that the 'tail-buoy power' is off. The streamer must be fed through the appropriate Spooling Block before being connected to the tail-buoy. Before deploying the navigator checks the power module reading to make sure the tailbuoy is drawing amps.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 141 of 182

Streamer Levelers (Birds)

Each Bird needs to be individually inspected prior to commencement of streamer deployment. The following items must be thoroughly checked:

1. Using the DigiCOURSE modem and computer check the battery voltage of each Bird. If either battery bank is reading less than 6.5v, then these should be changed.
2. Set fin angle to zero degrees. The Wing/Coil Assembly may now be removed, by undoing the relevant screws.
3. Clean all exposed surfaces. Clean motor piston using a cotton bud. Spray connectors with electrical contact cleaner. Ensure wing lever arm is tight to the wing shaft, change and re-grease gasket and 'o' rings and replace Wing/Coil Assembly to Bird. Make sure everything is seated properly and no 'O' rings are trapped.
4. Using the DigiCOURSE software carry out a wing reset function. This will show whether the Wing/Coil Assembly was refitted correctly and if there are any problems with the motor module.
5. Check that the Depth Calibration is correct and also that the compass is functioning by observing that the Read Heading corresponds to the movement of the Bird.
6. Finally check the Bird visually i.e. wings, latch pins, Bird collars. If all checks are good then the Bird maybe placed on the relevant Bird Tree, ready for deployment.

Acoustic Pods

Each Acoustic Pod needs to be individually inspected prior to commencement of streamer deployment. The following items must be thoroughly checked:

1. When checking Acoustic Pods the same DigiCOURSE software is used, but use the Acoustic menu.
2. First check the Battery Voltage of the unit. Ensure the voltage is acceptable.
3. The Acoustic Pod's SIGR count should read 80, if so the 90 degree Pinger should be 'scratched' and the SIGR count should now read 60.
4. The pulse count of the Pod should read 175.
5. The Pod should then be checked visually i.e. Latch pins, collars, Pinger guard. If all checks are good then the Pod should be placed on the relevant Bird Tree, ready for Deployment.

Wide Tow Streamer Deployment

The tail-buoys, having been prepared, checked and powered are the first items to be deployed from the Gun chute.

1. Remove Gun Deck chute gates. Care must be taken to ensure personnel working close to the chute have workvests with safety lines attached. Gun Deck CCTV cameras must be viewing this area, enabling the bridge & recording room to oversee operations.
2. The tail-buoy telemetry/GPS health is checked by Navigation before deploying the tailbuoy and the Recording room is notified upon the deployment of each individual tail-buoy.
3. Using overhead tigger winches, tailbuoy can be maneuvered to the top of the chute, release the winch hook and allow the tailbuoy to slide down the chute under its own inertia.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 142 of 182

4. Notify Bridge and Recording room upon the deployment of each individual tail-buoy and check that the stable and towing correctly.
5. The streamer can now be let out at a speed determined by the depth the streamer maintains when in the water and under tow. A Streamer should never reach depths of more than 30 meters or pressure damage could result. Crew in the recording room, who are in constant contact with the streamer deployment crew, monitors depths. The speed of the ship and the RPM of the streamer reel is the key to maintaining even streamer depths during deployment. All depth references are relative to the speed of the vessel through water. It is also worth noting that the faster the vessel travels, the more strain is put on the streamer, which in turn could cause it to part. The faster the streamer is deployed the less pull it has, causing it to sink. If the streamer is sinking too fast then a halt on deployment will allow the depths to stabilize under tow. An even balance is required to prevent damage to the streamer.
6. Streamer deployment should be halted when each streamer leveler or acoustic pod collar is at the attachment position, just aft of the spooling block. Care should be taken to bring the deployment to a smooth stop, so as not to put undue stress on the hardware or streamers.
7. Two members of the streamer deployment crew are required for attaching Streamer Levelers, or Acoustic Pods to the Streamer, one to hold and support, while the other locks collar latches into place and affixes Safety Lanyard. Care should be taken when stopping the cable to attach or maintain depth levelers or similar attachments.
8. Repeat the above procedures, noting any repairs on the worksheet, until the streamer is deployed as far as the Armored Lead-In Bend Restrictor attachment point.
9. Attach Bend Restrictor, (See Bend Restrictor Attachment Procedures).
10. Attach the Paravane tow line to the Bend Restrictor.
11. Further deploy the streamer, in conjunction with the Paravane deployment (see Sub-Section 1) maintaining clear and precise communications with the Paravane deployment team. The Paravane, as it is being deployed, should be maintaining a pull on the streamer, while a carefully judged slack is maintained in the streamer Lead-In by the deployment operator, so as not to create any undue strain on the towed equipment and deployment hardware.
12. Attach buoys to the Lead-In at the attachment points, using Quick Connect Links.
13. Once the Paravanes are fully deployed the slack in the Armored Lean-In should be adjusted to its optimum, thereby completing the deployment process.
14. Advise Bridge and recording room that the particular streamer is fully deployed and secured at the tow position.
15. Replace safety chains and gates and clear the decks of any debris, tools or spilled oil.

Multiple Streamer Deployment

Additional streamers can be added to the same Paravane following the above procedures,

For Multiple Streamer deployment, a Tether Line attaches the Inboard Streamers, on both sides, to the Outboard Streamers; this is affixed at the Bend Restrictors of both Inboard & Outboard Streamers

Once the Paravane, with the Outboard Streamer attached, has been deployed to a safe distance from the vessel and unlikely to tangle or interfere with the inboard streamer deployment, and the tether connected to the Outboard Bend Restrictor & vessel is not under too much strain,

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 143 of 182

deployment of the inboard streamer may begin with precise communications between the Paravane deployment team and the streamer team.

At the Inboard Bend Restrictor the tether is attached, then the two streamers are let out with the Paravane, judging the correct tension as they go out to their respective tow points. As the two streamers and the Paravane are being paid out to Tow position the tether line is paid out from on the deck. The tether line must be laid out in such a way that it will not tangle or snag, and crew should never stand in the bite of the tether.

Once the Paravane and Streamers are deployed to their towing positions set them to shooting depth. The bridge is to be advised and the time logged. A ballast and diagnostic check is carried out, then the procedure is repeated on the other side of the vessel.

All decks are cleared and cleaned, hydraulic systems disengaged, logs completed.

8.4 Streamer Section or Module Replacement

Streamer Section or Module Replacement

Personnel

Personnel Performing Operation : Observers

Minimum Number of Personnel : Three (3)

Duties:

- 1–Streamer Reel Operator
- 1–Performing Replacement Task
- 1–Assistant

Supervision : Senior Observer

Job Safety Analysis : Chief Observer

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Hard Hat, Work Vest, Tether Harness (if necessary)

Recommended : Eye Protection, Gloves, Back Protection

Overview

The streamers are composed of sections, 150 meters in length, containing 84 hydrophones mounted along the center axis. The streamer sections are coupled together using a digitizing module, located at the head of each section to digitize and relay the received seismic signals to the onboard recording system. Defective sections or modules are replaced as required.

Potential Hazards

- Cable Oil is a solvent and can cause burns and irritation to exposed skin and eyes.
- Fire due to the low flashpoint of cable oil.
- Marginal Weather and Sea conditions.
- Falls caused by slippery footing from water and spilled cable oil.
- Electric shock from cable DC power.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 144 of 182

- Two personnel utilized to handle section and module replacement.
- Training on fire foam system use.
- Location of an eye wash station and shower near the Streamer Deck.
- Strict control of cable oil spills. Immediate clean up of spills.
- Good communication between the Recording room and the streamer team on the streamer power status.
- CCTV monitoring from Bridge and Recording room.

Special Precautions

- At ANY TIME a streamer section is disconnected or connected the streamer power is turned OFF. The Streamer crew calls the Recording room to turn the streamer power off via the intercom system. Verbal acknowledgment is REQUIRED after the power is off.
- The Streamer crew will advise the Recording room when the Streamer is reconnected; in order to immediately monitor the Streamer and conduct testing.
- ANY cable oil spills are immediately cleaned from the deck, and personnel are to rinse any cable oil from their skin and clothing immediately.

Streamer Section and/or Module Replacement Procedure

The Section or Module to be changed needs to be 'Chained off' at the tail end. 'Chaining off' is the term used for bringing the streamer under tow from a deck mounted towing harness, taking the strain off the streamer reel. The tow harness is a series of Dextron Ropes linked to a hinged clamp. The clamp fits around the streamer section and is secured with lock bolts. Care must be taken to ensure the lock bolts are tightened to the limit of each thread, thus making sure that the clamp is held fast on the Streamer. Also ensure that the Dextron Ropes leading from the clamp to towing points are not twisted or uneven, as towing the streamer this way could cause undue strain and possible failure of one element of the tow harness.

1. Once the streamer has been 'chained off', the towing tension can be released from the streamer reel to the tow harness, allowing enough slack for the streamer section or module to be disconnected.
2. Communicate with the recording room to ensure that the power to the streamer is switched off. A verbal acknowledgment must be received from the recording room prior to disconnecting the streamer section.
3. Disconnect Section or module at both ends, using Allen Key & C- Spanners.
4. Fit protective caps to the exposed ends of section or module, label and attach fault report, and remove to safe stowage.
5. Connect replacement section, connectors should be sprayed with Isopropyl Alcohol and 'o' rings should be replaced & greased. Tighten fittings using Allen Key & C- Spanners.
6. New Program Plugs should be changed if necessary.
7. Take up the slack and resume towing with the Streamer Reel.
8. Communicate with Recording room, to switch the streamer power on and test replacement Section or Module.
9. Remove tow harness and Dextron Ropes, and resume deployment of streamer.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05

8.5 Streamer Section Patching

Streamer Section Patching

Personnel

Personnel Performing Operation	: Observers
Minimum Number of Personnel	: Three (3)
Duties	: 1–Streamer Reel Operator 1–Performing Patching Task 1–Assistant
Supervision and Fire Watch	: Senior Observer
Job Safety Analysis	: Chief Observer

Personal Protective Equipment

Minimum P.P.E. Required	: Work Boots, Hard Hat
Recommended	: Eye Protection, Gloves, Back Protection

Overview

Each streamers section is 150 meters in length containing 84 hydrophones. Around each hydrophone is 200 milliliters of cable oil. Small holes can sometimes appear in the plastic jacket, which need to be sealed with insulation tape as soon as possible.

Potential Hazards

- Cable Oil is a solvent and can cause burns and irritation to exposed skin and eyes.
- Fire due to the low flashpoint of cable oil.
- Marginal Weather and Sea conditions.
- Falls caused by slippery footing from water and spilled cable oil.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Fire Watch on standby.
- Training on fire foam system use.
- Location of an eye wash station and shower near the Streamer Deck.
- Lith-X extinguisher for Lithium Batteries should be on standby.
- Strict control of cable oil spills. Immediate clean up of spills.
- CCTV monitoring from Bridge and Recording room.

Special Precautions

- ANY cable oil spills are immediately cleaned from the deck, and personnel are to rinse any cable oil from their skin and clothing immediately.
- Fire Watch to be familiar with Foam Deluge System operation.

Streamer Section Patching Procedure

1. Holed sections should be patched both on deployment and recovery of the streamer.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 147 of 182

Restrictor. The 2nd layer of rods (Used on the outer most two lead-ins on each side) is assembled over the first layer with the lay of the rods being OPPOSITE to the first.

2. OTS Dextron fast grips are now placed with the towing eyes at the center point of the helical rods, one grip in each direction with the eyes almost touching. With temporary tape holding the eye in place spiral down the assembly wrapping two of the four legs around the lead-in in opposite directions until only sufficient is left to tie off with a reef knot. Repeat with the other two "legs" of the grip. Repeat again with the other grip.
3. The delta plate should now be fitted, remove the two pin and bush assemblies from the main delta plate that have the greatest distance between them. Insert the tow eyes of the fast grips in-between the upper and lower plates of the delta plate assembly and re insert the pins and bushes into the eyes. Tighten bolt accordingly.
4. The Bend Restrictor is now ready to have the Tow Lines (Tethers) to the Paravanes attached.
5. The removal of these units is a reversal of the above procedure.

8.7 Streamer(s) Recovery

Streamer(s) Recovery Procedures

Personnel

Personnel Performing Operation : Observers/Gun Mechanic, Navigator, Chief Mechanic

Minimum Number of Personnel : Four (4)

Duties : 1–Winch Operator
2–Streamer Handler
1–Operation Observer

Supervision : Party Manager/Operations Supervisor/Chief Observer

Job Safety Analysis : Chief Observer

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, , Hard Hat.

Recommended : Hearing Protection, Eye Protection, Back Protection, Work Gloves

MSDS

Cable Oil, Lithium Batteries

Overview

Streamer(s) recovery procedure will differ depending on the purpose of the retrieval. Although guidelines for several different scenarios are depicted, it must be remembered that they are just guidelines. Often situations will arise that will necessitate slight deviations to the procedures. The Party Manager, Shift Leader, Navigator, Officer on the Bridge, and the Observers, must formulate a clear plan. Factors such as shipping traffic, obstructions, shallow water, currents and estimated time of retrieval must all be considered.

Potential Hazards

- Cable Oil is a solvent and can cause burns and irritation to exposed skin and eyes.
- Fire due to the low flashpoint of cable oil.
- Personnel are working near the stern.
- Marginal Weather and Sea conditions.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 148 of 182

- Falls caused by slippery footing from water and spilled cable oil.
- Electric shock from cable DC power.
- Lithium batteries. (see section on lithium battery storage and handling)
- Potential entanglement of towed equipment in ships propellers.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Four personnel utilized to handle deployment and recovery operation.
- Training on fire foam system use.
- Location of an eye wash station and shower near the Streamer Deck.
- Lith-X extinguisher for Lithium Batteries.
- Strict control of cable oil spills. Immediate clean up of spills.
- CCTV monitoring from Bridge and Recording room.
- Turn vessel to head seas if deemed by the Party Manager to be beneficial.

Special Precautions

1. The Work Area is defined and confirmed by the Party Manager, and the Master, before any Streamer recovery operation commences. The Bridge will closely monitor shipping traffic in the area and notify the Instrument and Navigation personnel of any developing situation.
2. The Navigator will monitor the course, and speed, and advise the Bridge and Streamer crew of any necessary course alterations during the Streamer operations. The Navigator is responsible for monitoring the water depth and setting the initial depth of the "Birds" during deployment.
3. At ANY TIME a streamer section is disconnected or connected the streamer power is turned OFF. The Streamer crew calls the Recording room to turn the streamer power off via the intercom system. Verbal acknowledgment is REQUIRED after the power is off.
4. The Streamer crew will advise the Recording room when the Streamer is reconnected; in order to immediately monitor the Streamer and conduct testing.
5. ANY cable oil spills are immediately cleaned from the deck, and personnel are to rinse any cable oil from their skin and clothing immediately.
6. It is UNSAFE to deploy the Streamer in deteriorating weather conditions.
7. Prior planning of the work to be performed understood by all involved before the Streamer is deployed or retrieved.
8. All personnel are to remain inside the safety railings during streamer operations.

Preparation Check List

Prior to any Streamer work a clear plan must be understood by all concerned. The Shift Leader must discuss the work with the Party Manager/Operations Supervisor, possible resolutions for problems are discussed, and contingencies for probable difficulties are planned.

The Shift Leader will assign personnel to their duties and ensure the duties are properly completed. He also ensures all personnel are wearing appropriate PPE for the task and conditions.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 149 of 182

Prior to the deployment of any trailing equipment, the Observer will consult with the Bridge to determine if the recovery area is suitable for the task at hand, and the vessel's speed and direction are conducive for the operation.

The operational condition of the deployment and recovery, equipment is checked well before any foreseen Streamer work is required. Directly prior to Streamer work the following equipment check is performed:

- a) Cable reel and winch controls.
- b) Communications equipment.
- c) Life rings and fire extinguishers are in proper locations.
- d) Streamer tools complete and ready.

Once all checks are complete the hydraulics can be initialized.

Streamer Recovery

Navigators are responsible for monitoring the water depth and setting the birds during recovery.

The speed of recovery depends on circumstances, but the Streamer should never reach depths of more than 30m as pressure damage could result. Crew in the recording room, who are in constant contact with the streamer recovery crew, monitors depths. The speed of the ship and the RPM of the streamer reel are the key to maintaining even streamer depths during deployment.

All depth references are relative to the speed of the vessel through water. The slower the streamer is recovered the less pull it has, causing it to sink. A constant visual check is required on level winding and the tension of the streamers as they are wound onto the reel, as damage may occur i.e. holed sections or telemetry failure, if the tension is excessive.

Streamer recovery should be halted when each streamer leveler or acoustic pod is at the detachment position, just aft of the spooling block. Care should be taken to bring the recovery to a smooth stop, so as not to put undue stress on the hardware or streamers.

Two members of the streamer recovery team are required for detaching Streamer Levelers, or Acoustic Pods from the Streamer, one to hold and support, while the other unlocks collar latches and detaches Safety Lanyard.

Any repairs to the Streamer must be noted on the worksheets during recovery.

Standard Recovery Procedures

Turn head seas. Notify the Bridge to reduce vessel speed to approximately 3.2 Knots.

The inner streamer should be released from its towing bridle as it is the first to be recovered, and proceed with recovery, in conjunction with one Mid and Outer streamer, and their associated Paravane. This operation, as with the deployment, requires clear and precise communication with the paravane recovery team.

The support buoys (if any) on the streamers' Lead-Ins are removed as the streamers wind through their spooling blocks, until the Inner streamer Bend Restrictor is at the spooling block. Remove the separation rope to outer streamer & Bend Restrictor outer clamp swivel.

Continue to pick up the center and mid streamers while recovering the outer streamer until the Bend Restrictor is at the spooling block. Recover the separation rope using the winch. Remove the Bend Restrictor outer clamp swivel.

Halt outer streamer recovery operations and release the Paravane topline, instructing the Paravane recovery team to fully recover the Paravane to the stowing position (See Paravane Recovery Procedures).

Repeat the above with the other Paravane and the two or more remaining deployed streamers. While the paravane recovery team are in the process of safely securing the last Paravane in its

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 150 of 182

stowing position, all streamers need to be staggered in-line with the inners the shortest, first Mid & Outer next shortest, and the second Mid & Outer the longest.

Adjust Leveler depths so that the streamers are also staggered horizontally, ideally towing the Center streamer the shallowest at 8 - 10m, the Mids at 15 - 18m and the Outers at a depth of 23 - 26m.

The bridge will be notified that the speed will need to be dropped and the Bow Thruster needs to be activated.

Streamer recovery should be halted when each streamer leveler or acoustic pod is at the detachment position, just aft of the spooling block. Care should be taken to bring the recovery to a smooth stop, so as not to put undue stress on the hardware or streamers.

Two members of the streamer recovery team are required for detaching Streamer Levelers, or Acoustic Pods from the Streamer, one to hold and support, while the other unlocks collar latches and detaches Safety Lanyard.

Any repairs to the Streamer must be noted on the worksheets during recovery.

The Tail Buoys will be recovered in the reverse of the 'Tailbuoy Deployment Procedure.

Once all Streamers have been fully recovered and the Tail Buoys are secured onboard notify the Bridge and the Recording Room.

Turn power OFF to all streamers, Lock-Out or disengage the Hydraulic Control Station, replace safety chains and gates and clear the deck of any debris, tools or spilled oil.

Standard Recovery Procedures (Single Streamer "B, C or D" only)

The Streamers that are not being recovered should be taken to a depth where they will be safely under the recovered streamer. The streamer being recovered should be at least 2 meters shallower than the deeper streamers. The depths used should be decided based on currents in the recovery area. Do not bring the Streamer to the surface, as this will allow any surface current to have a greater effect on the Streamer. If the survey is utilizing a small separation between streamers, i.e., 50m, deploy an additional 25m between each streamer to increase the separation both in line and cross line. Deploy remaining Streamers and their paravanes out wider and longer.

Instruct the Bridge to decrease vessel speed as much as possible, but still maintaining a good bite on the paravanes, typically about 3.2 knots. IT IS IMPERATIVE THAT A NAVIGATOR IS IN THE INSTRUMENT ROOM MONITORING THE CABLE DEPTHS.

Normally the recovery should continue until you reach the farthest point needed for cable work, i.e., the lowest number module or section, before cable work begins.

The Tailbuoy will be recovered in the reverse of the Tailbuoy Deployment Procedure.

Once the Streamer have been fully recovered and the Tailbuoy is secured onboard notify the Bridge and the Recording Room.

Unless the Streamer is going to be deployed immediately Turn power OFF to the streamer, Lock-Out or disengage the Hydraulic Control Station, replace safety chains and gates and clear the deck of any debris, tools or spilled oil.

8.8 Gun Array Deployment and Recovery

Gun Array Deployment and Recovery Procedures

Personnel

Personnel Performing Operation : Chief Mechanic/Gun Mechanic, Observer

Minimum Number of Personnel : Three (3)

Duties : 1-Winch Operator

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 151 of 182

2-Gun Array Handlers

Supervision : Chief Mechanic/Senior Mechanic

Job Safety Analysis : Chief Mechanic

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Hard Hat, Work Vest, Hearing Protection, Tether Harness in Danger Zone, UHF Radio

Recommended : Work Gloves, Eye Protection, Back Protection

Lock Out/Tag Out

The Lockout Key Holders are as follows:

Airgun Systems : Gun Mechanic

The Chief Mechanics or Crew Leaders are the only personnel authorized to unlock any part of the system. The reel systems are equipped with limit switches, which do not allow the reels to operate unless the deck leads are unplugged.

Overview

Airguns are devices that rapidly release compressed air into the water creating the effect of an explosion. The energy released generates a pressure wave that is the source of the seismic signal necessary to perform an offshore geophysical survey. Air compressors, capable of producing a large amount of air at high pressure, are used to continuously replace the air discharged by the operating airguns. The typical working pressure is 133 bar, (1950 psi). The Sub-Array are deployed and retrieved with 34 bar, (500 psi).

Deployment and recovery of the Gun Arrays is conducted from the Gun Deck. The Gun Arrays are stored on overhead trolley rails located mid-ship, one Sub-Array per rail. Sub-Arrays are deployed and retrieved one at a time. A constant tension winch is utilized as required to move and deploy the Sub-Array. Each Sub-Array is deployed out the stern down the central gun chute. Recovery is reverse of deployment.

Potential Hazards

The air gun is the system component that requires the most handling and maintenance and consequently, represents the greatest danger to personnel.

The main switches for disabling/enabling, triggering, and pressure control must be operated from the deck by the crew working on the guns, not from a remote location.

The operating pressure of the airguns used onboard the Veritas Viking 2 is typically 133 bar, 1950 psi, which can be equated to 60 times greater than the pressure found in the average automobile tire. Any release of air at this pressure can tear flesh and may force dust, air, or oil particles through the skin and into the blood stream. Loose, damaged, or weakened gun parts can fail under pressure and become airborne missiles.

CAUTION AROUND AIRGUNS MUST BE OBSERVED AT ALL TIMES.

- HIGH PRESSURE AIR.
- Failure of one or more winch line.
- Tangling personnel in loose lines, ropes, or Sub-Array.
- Personnel are working near the stern without the stern fence in place.
- The Sub-Arrays are large, long, and heavy.
- Multiple winches in use.
- Marginal Weather and Sea conditions.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 152 of 182

Preventative Measures

- Training of personnel in the deployment/recovery operations prior to assignment on the team.
- Use of additional protective equipment as the conditions merit.
- Three personnel utilized to handle arrays.
- Frequent and documented inspection of personal protective equipment - PPE. Includes workvests, tether lines, harnesses.
- Communication check with Instrument Room and Bridge
- Video monitoring from Instrument Room and Bridge.
- Frequent and documented inspection, maintenance, and replacement of all winch ropes.
- Frequent and documented inspection of the Airguns, Winches and Sub-Arrays

Special Precautions

- Never put your hands in the front jet of air or any pressurized discharge port. Air can penetrate into your blood vessels, causing an embolism, which can be fatal.
- Only qualified persons shall operate the air-guns, the handling equipment, including lines, rigging, tugger winches, snatch blocks and booms while deploying, retrieving, and working on air-gun systems.
- All personnel in areas where there is a risk of the sudden release of air shall wear ear and eye protection while the system is operating.
- Eye wash stations are located on the port and starboard sides of the gun deck.
- The storage tanks, pipes, lines, and fittings used to carry and control this high pressure are specialized equipment and must receive special attention. Never handle, tighten or loosen bolts or fittings, or hammer any part of a high pressure system while pressure is applied.
- Pressure relieving valves and other safety devices should never be removed or modified except for repair or adjustment by qualified personnel.
- Any ball valves installed upstream or downstream of a relief valve should be locked in the open position.
- When opening valves, always close the valve one-half turn after reaching the maximum open position.
- The use of sub-standard replacement parts may be dangerous.
- Every high pressure air injection injury, no matter how small, should be treated seriously. The absence of pain is not to be accepted as a lack of injury or a positive sign. An accident or near miss report should be filed.

Explosion Hazards

Another danger of compressed air is the possibility of explosion. When high-pressure air reacts with combustible fluids in the piping or other system components, explosions can occur. Explosions can also occur when high temperatures are created by sudden compression in the dead end (compression ignition), or when a gauge valve is opened to a vented gauge containing oil. Even a thin film of lubricating oil in the system piping may explode.

- Once ignition occurs, propagation of a shock wave may cause the pipes to be ruptured at many locations.
- To minimize risks:
- Open all valves slowly.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 153 of 182

- Keep all compressed air and piping free of oil and other combustible contaminants.
- Never assemble any pneumatic equipment using hydrocarbon oils or grease. Use only vegetable or synthetic oils (as used in compressors) or silicone grease.
- Ensure the compressed air after-cooler is operating to specifications to prevent oil ignition due to high temperature.
- Prevent ignition from other causes such as electro-static discharge, compression of oil foam in a pump, external shock and external fire.
- On deck, repairs must be performed with care. Keep open flames and other heat sources away from the air lines and electrical cable. During inclement weather, repairs must be performed under temporary cover. Electrical soldering irons and lifts must be grounded to the ship's deck. Use the proper hand tools to prevent slippage and injury to maintainers and the burring of hardware, which can cause further injury. (Any burrs on hardware must be filed down or the hardware replaced.)
- Pipes and hoses must be secured at frequent intervals along with their length so that in the case of fracture, the ends do not whip.

Standard Operating Procedure

Deployment of Sub-Arrays

1. Prior to the deployment of the gun arrays, a clear plan of the work to be undertaken must be understood and clarified by all concerned. (i.e. Gun crew, Observers, Navigation.)
2. The Crew Leader is in command of the gun deployment and all hydraulic controls during this operation. He is to ensure all assisting personnel have the correct PPE.
3. Air pressure to the sub-array is set at no more than 500 psi to seal the guns for deployment.
4. Inform the bridge and recording room that the guns are ready for deployment and request approval for adjustment of the vessel speed as required. State clearly which sub-arrays are to be deployed and in what order.
5. Check:
 - (a) Reel deck leads are unplugged.
 - (b) All sub-array main air control valves are closed at the reels.
 - (c) All deck lead-ins are disconnected and safely stowed in the brackets provided.
6. Illuminate the orange warning strobe lights, indicating high pressure on the deck.
7. Charge accumulators to 500psi (34bar) Compressor can be shut down at this point if deemed necessary.
8. Visually check around the gun deck port and starboard spaces. Instruct all personnel to stand clear prior to the airing up of the guns.
9. Sound one continuous 15 second long warning signal on the Klaxon.
10. Open sub array "air charge" valve to allow the sub array to be charged up to a maximum pressure of 500psi.(34bar) Ensure the charge valve is fully closed and close main manifold supply valve. **Special caution to be taken to avoid airline and jumper entanglement now that the guns contain 500psi.**
11. The constant tension winch cable should be connected to the last gun trolley chain to aid in pulling the sub array down the rails to the gun chute. When each gun is at the top of the chute the trolley chains and the tugger winch cable can be released.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 154 of 182

12. Move the constant tension winch cable along to the next gun trolley and repeat the process, until the weight of the sub array allows it move along the rail under its own inertia. The sub array can now be deployed using the main umbilical winch. Extreme care is necessary, when disconnecting the trolley chains, to avoid entanglement with the array as it is moving along the deck.
13. When the sub-array is successfully deployed clear of the stern, the tag line is attached at the tow point using the quick connect links, prior to the array being further deployed to its towing position.
14. By repeating the above processes, the remaining sub-arrays can be deployed prior to the umbilical deck lead-ins being re-connected, and the Crew Leader can increase the air pressure to its operating level and inform the recording crew that the arrays are fully deployed and at the required warm up pressure.
15. The GCS 90 system can now be switched to operating mode allowing the guns to cycle automatically.

Recovery of Sub-Arrays

1. Prior to the recovery of the gun arrays, a clear plan of the work to be undertaken must be understood and clarified by all concerned. (i.e. Gun crew, Observers, Navigation.)
2. On completion of the line, the senior gun mechanic should ensure the GCS 90 system cycle has been turned off, get verbal confirmation from the seismic observer of this, and permission to continue with the recovery operation. The Compressor Mechanic can be informed that the compressors are no longer required and can be shut down
3. After confirmation the senior gun mechanic unplugs the reel deck leads effectively disabling the guns and allowing the reels to operate. The limit switches will not allow the reels to operate with the deck leads still attached.
4. The air pressure on all the guns are bled down to 500psi. (34 bar) from the Fisher valve in the gun shack. The engine room is informed that the line has ended and that only one compressor is required. Illuminate the orange warning strobe to signify that there is still pressure in the system and that gun work is about to commence.
5. The senior gun mechanic ensures that everyone is wearing PPE prior to recovering the sub-array's in reverse to the procedure for deployment. The Crew Leader is in command of the gun recovery and all hydraulic control winches during the operation, and
 - a) In the case of an air leak or auto -firing gun extra caution is to be taken.
6. When the guns are at the back of the vessel, start bleeding down the sub-array.
7. Locate the air leak and notify all personnel.
8. Stand clear until pressure ceases.
- 10 Continue with the recovery.

Venting the System.(When no requirement to vent the air from the sub array prior to recovery exists)

- 1 Visually check around the gun deck port and starboard spaces.
- 2 Sound one continuous 15 second long warning on the Klaxon siren.
- 3 Open the sub array vent valve on the manifold until the air pressure gauge for the sub array is showing zero pressure on the gauge at the reel.
- 4 Ensure sub array vent valve is ~~LOCKED~~ OPEN and charge valves LOCKED CLOSED.

Only Qualified Senior Gun Personnel Are To Be Involved In The Airing Up/Bleeding Down Of The Guns.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 155 of 182

The Crew Leader assigns individual gun repairs to be performed (under his supervision) by the gun crew.

Before commencing work, each individual in the gun crew must check the pressure gauge on the main manifold, to make sure all of the guns on deck are zero psi. and confirm this to the senior gun mechanic.

Test firing of airguns on deck **is not** permitted.

After all of the gun maintenance has been completed, the decks are cleared in preparation for re-deployment.

8.9 Tailbuoy Deployment and Recovery

Tailbuoy Deployment and Recovery Procedures

Personnel

Personnel Performing Operation : Observer/Gun Mechanic, Chief Mechanic

Minimum Number of Personnel : Three (3)

Duties : 1-Winch Operator
1-Line Handler
1-Operation Observer

Supervision : Chief Mechanic/Chief Observer

Job Safety Analysis : Chief Observer/Chief Mechanic

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Work Gloves, Hard Hat, Work Vest

Recommended : Back Protection, Hearing Protection, Tether Harness, Work Gloves

Overview

The tail buoy is towed at the end of each streamer and equipped with GPS positioning equipment. It is the first piece of equipment deployed on the streamer.

Potential Hazards

- Failure of winch line.
- Personnel are working near the stern without the stern fence in place.
- The Tailbuoy is large and heavy.
- Marginal Weather and Sea conditions.
- There are two sources of power, the battery and the streamer.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Frequent and documented inspection of winches and cables.

Pre-Deployment Checks (Checklist in Section 9 Miscellaneous Sample Forms)

- All bolts tightened.
- Antennae and associated peripherals such as the beacon, battery and strobe light are secured.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 156 of 182

- All shackles secured with locking wire.
- The tail buoy beacon is functioning correctly.
- The strobe light is working.
- Stic (Streamer Tailbuoy Interface Cable) cable is inspected for damage.
- Tag line is inspected for damage.
- Tow stop is inspected for damage.
- Check the diode in the stic cable.
- Ensure 24V is available on the correct pins at the end of the stic cable.

Deployment

- 1 Ensure the vessel speed is correct for deployment.
- 2 Make sure the tail buoy tow harness, tow rope and tag line are clear of any obstacles on deck.
- 3 Make sure no personnel are standing inside the bight of any tow ropes or streamer.
- 4 Assure the person launching the tail buoy is in the center of the slipway so the antennae clears the overhead.
- 5 Deploy the tail buoy down the gun slipway.
- 6 Notify the instrument room that the tail buoy is fully deployed.

Recovery

- 1 Ensure the vessel speed is correct for Recovery.
- 2 Connect recovery rope winch on gun-deck.
- 3 Ensure the power is off before disconnecting.
- 4 Pull tail buoy up the gun slipway using the winch and attempt to center the tail buoy in the slipway.
- 5 Move the tail buoy to a safe location, ensuring the antenna doesn't hook on over hanging objects.
- 6 Clean tail buoy if required.
- 7 Clean both end connections and cap connections.
- 8 Secure tailbuoy.

8.10 Small Boat Operations

Small Boat Operations

Personnel

Personnel Performing Operation : Workboat (Seismic Personnel), FRB (Marine Crew)

Minimum Number of Personnel : Three (3)

Duties : 1-Coxswain
2-Crew

Supervision : Master/Party Manager

Job Safety Analysis : Operations Supervisor/Party Manager

Personal Protective Equipment

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 157 of 182

- Minimum P.P.E. Required : Work Boots, Work Gloves if suitable for task, Geco Helmet, Work Vest
- Recommended : Survival Suit(required when water temp. is <15C), Back Protection, Eye Protection, Sun Screen,

Overview

Due to the nature of multi-cable operations the use of either FRC type or Norpower dedicated small boats is sometimes necessary for efficient operations. The FRC can be used for work such as changing streamer hardware i.e., levelers, acoustic pods, tail buoy batteries, cutting off fishing gear, retrieving lost equipment, transferring personnel or supplies. Purpose built Norpower work boats are to be utilized for tasks which require towing, such as changing streamer sections. Either of these craft may be used for transfer of personnel between the Veritas Viking II and a support vessel.

Potential Hazards

- Launch and recovery breakdowns.
- Capsize.
- Man Overboard.
- Engine or radio malfunction.
- Exposure to the elements.
- Slips, Trips, and Falls.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Sea survival training for all crew members.
- Use of additional protective equipment as the conditions merit, particularly PPE to protect from environmental exposure.
- Frequent and documented inspection, maintenance, and replacement of all FRC/Norpower components.
- Frequent inventory checks of safety equipment, life vests inspected before donning.

Restrictions

1. There are no tasks offshore critical enough to compromise the safety of the FRC/Norpower crew or the equipment.
2. The Party Manager advises the Master of the proposed work and requests permission to utilize the Small Boat.
3. The Small Boat is NEVER operated when:
 - a) In the hours of darkness. (Except in life threatening emergency situations)
 - b) The operation cannot be completed before Civil Twilight in the area of operations
 - c) Visibility is significantly reduced by rain, fog, hail, snow, etc.
 - d) A guard vessel is not in close proximity, or the standby FRC/Norpower boat is not fully operational
 - e) The combined wind, sea, and swell endangers safe launch and recovery.
5. The FRC/Norpower boat is NEVER tied to any part of the towed equipment without the use of a quick release mechanism.

Deployment and Recovery of FRC/Norpower Work Boat

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 158 of 182

1. All permits shall be completed and signed, Toolbox Meeting conducted with the Captain, Party Manager, and/or Operations Supervisor all FRC/Work Boat crew members present.
2. Guard vessel shall be dispatched in a timely manner to ensure their location is near work area.
3. The Recording Room must be ready to disable the guns, if not already done so, on deployment and retrieval of FRC/Norpower boat.
4. Backup FRC shall be readied for deployment, crew assigned before toolbox meeting.
5. Lee should be given for launching of FRC/Norpower boat where possible.
6. The embarkation person ensures all personnel are wearing appropriate PPE prior to launch.
7. The launching procedure is performed by experienced personnel, who are trained in the task and approved by the vessel Master.
 - a) The FRC/Norpower boat is lifted from its cradle and lowered to the boarding station.
 - b) The davit is then swung inboard so that the FRC/Norpower boat is held firm against the ships side.
 - c) Personnel board the craft and assume their positions on the outboard side of the FRC/Norpower boat.
 - d) Radios and GPS beacon are checked and confirmed operational
 - e) The FRC/Norpower is then lowered to the water and the engine started.
 - f) e) The lifting hook is should be immediately released when the craft hits the water.
 - g) Coxswain should engage forward propulsion and pull forward to allow slack for the painter line to be disconnected.

Standard Operating Procedure

1. Prior to launch all inspections are completed on the FRC/Norpower Boat. The inspection shall include a check of all fluid levels, a visual inspection of all lifting equipment, a visusl inspection of the bow line and release mechanism, first aid supplies, drinking water, sun screen, primary and back up VHF radios, RTT beacon status.
2. The minimum manning level for any sortie is three persons, a Coxswain plus experienced and trained crew, and must include one person of either Senior or Chief level. Total number of persons is dependent on the task.
3. All FRC/Norpower crew plus Master, Party Manager and/or Operations Supervisor to be briefed on proposed operation prior to deployment. Any changes in plan once in the water to be relayed to the mother vessel and the Management of Change process completed.
4. All FRC/Norpower boat crew must wear properly donned gear appropriate for the climatic conditions and for the proposed task(s). A double chamber manually inflated life vest is required at all times. A Geco Helmet is required during deployment and retrieval. In cold conditions the crew must wear a survival suit, on retrieval and deployment and during operations, the survival suit must be fully fastened with the hood up. In tropical climates, the wearing of the survival suit is optional. All crew members should wear hats, long sleeves and long pants (coveralls) when prolonged exposure to the sun is expected. These items should be taken in the workboat in case of an unexpected problem. Maximum strength sun block should be applied to exposed skin prior to launch.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 159 of 182

5. The chase boat, if available, must standby in close proximity to the FRC/Norpower boat should an emergency arise. If a chase boat is not available, the second FRC or lifeboat must be readied for launch.
6. The FRC/Norpower boat must maintain radio contact with the ship at all times, with intervals not exceeding 15 minutes. If this is not followed the second FRC may be deployed for rescue. Radio checks to continue throughout the entire operation.
7. All FRC/Norpower crew must have undergone survival training and hold a current survival certificate from an approved offshore survival school.
8. The Coxswain must have an approved FRC Coxswains Certificate and at least 50% of the crew must have undergone training at an approved small craft operators school or received training onboard from Veritas small boat trainer.
9. The minimum FRC standard is as follows:
 - a) Fully intact or inflated floatation collar.
 - b) Equipped with self righting mechanism (Norpower boat exempted) .
 - c) Fitted with VHF radio and portable VHF as back up.
 - d) Be launched and recovered from single point lift, over the side davit or crane.
 - e) Fully fueled.
 - f) Carrying emergency pack containing first aid kit, flares, drinking water, basic tool kit, flashlight, spare batteries etc.
 - g) Fitted with radar reflector.
10. The responsibility for the maintenance and ordering of spares lays with the Chief Engineer. Any malfunction to, or maintenance and supplies required for the FRC, shall be brought to the attention of the Master and Party Manager.

In Water Equipment Repair or Replacement

1. Drive safely within the limits for the sea conditions with the helm manned at all times. All necessary tools and equipment, including spare tools should be carried in the craft to complete the task. The following procedures should be observed when changing or repairing Streamer hardware such as **Streamer Levelers and Acoustic Pods**:
2. The area of streamer to be worked on is sent to the surface by assigning (at least) two birds in front of area and one behind to zero depth.
3. Once the area of interest is on the surface the master vessel should slow down as needed by the workboat crew and still maintain cable depth control.
4. Position FRC/Norpower boat alongside streamer.
5. Locate faulty component by RGPS positioning or by serial number.
6. Hold FRC/Norpower boat in position using correct RPM's. **DO NOT attach FRC/Norpower boat to the towed equipment without the use of a quick release mechanism.** It is permitted to restrain the Small Boat with a painter, however one end **MUST** be free with no loops, knots or double wraps used, to allow for quick release if necessary.
7. In the case of the workboat, the cable may be retrieved using the hydraulic arm on the starboard side of the craft. The arm operator directs the coxswain who eases the craft alongside the cable. Once the arm is against the cable it is raised, catching the cable in the roller and raising it to working position. In the FRC, the cable must be pulled up to the side of the craft and dropped into the removable tray. It is permissible to use a rope to assist with this, provided one end is free with no loops, knots etc.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 160 of 182

8. Replace faulty component and test.
9. The workboat arm may then be dropped and the craft steered away from the cable. In the case of the FRC the cable must be manually lifted over the front of the tray, after which the craft can be steered away.
10. Return to vessel.
11. The same procedure should be followed when removing debris or fishing gear from the streamer. Caution is required when cutting fishing gear, as many barbs and hooks or frayed wires may be present, and open bladed knives present a hazard when used on the FRC.

The following procedures should be observed when changing or repairing Streamer hardware such as **Modules**:

1. The area of streamer to be worked on is sent to the surface by assigning (at least) two birds in front of area and one behind to zero depth.
2. Once the area of interest is on the surface the master vessel should slow down as needed by the workboat crew and still maintain cable depth control.
3. Position FRC/Norpower boat alongside streamer.
4. Locate faulty component by RGPS positioning or by serial number.
5. Hold FRC in position using correct RPM's. DO NOT attach FRC to the towed equipment without the use of a quick release mechanism.. It is permitted to restrain the Small Boat with a painter, however one end MUST be free with no loops, knots or double wraps used, to allow for quick release if necessary.
6. In the case of the workboat, the cable may be retrieved using the hydraulic arm on the starboard side of the craft. The arm operator directs the coxswain who eases the craft alongside the cable. Once the arm is against the cable it is raised, catching the cable in the roller and raising it to working position. In the FRC, the cable must be pulled up to the side of the craft and dropped into the removable tray. It is permissible to use a rope to assist with this, provided one end is free with no loops, knots etc.
7. Attach two A-3 Norwegian style buoys with a lanyard, one to the streamer section forward of the module to be changed, and one aft of the module to be changed. The buoys would enable floatation to this section of the streamer in the event that it had to be jettisoned from the FRC/Norpower boat in an emergency.
8. Attach the module changing harness to the module. Module Harness consists of: 2 x Syntron Tow Harness connected together by 2 Ratchet type Turnbuckles or Chain Ratchets to enable the harness to be tightened/loosened. 2 lengths of 16mm Long Link Chain or 2 lengths of Plexus Rope each 0.75m long are also connected between the tow harnesses acting as a fail-safe.
9. Request the streamer power to be turned OFF. Verbal confirmation of power status required before proceeding.
10. Tighten both turnbuckles or ratchets simultaneously to induce enough slack to enable the cable collars to be loosened.
11. Unscrew collars from the module, simultaneously loosening the turnbuckles or ratchets until the module is able to be removed.
12. Insert replacement module and fully secure one end by tightening the collars tighten both turnbuckles or ratchets simultaneously to enable the opposite collar to be tightened.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 161 of 182

13. Tighten set-screw and request streamer power to be turned ON and a test performed on the module.
14. Upon confirmation that module is operational, loosen turnbuckles to enable the harness to be removed.
15. Remove A-3 buoys and lift cable out of the tray and confirm the work is complete.
16. Return to vessel.

The following procedure shall be observed for replacing **Modules With the Workboat**.

Notes: It is important to have the correct length of towrope from the tow point to the clamp. The connector needs to be inside the boat for ease in disconnecting and connecting. Also, personnel must stay on the port side of the streamer at all times during this procedure. In the case of engine failure at this point in the procedure, the workboat would be towed on its starboard beam. It is considered an unsafe act to stand on the starboard side of the streamer during this operation.

1. The mother vessel should reduce power to the minimum safe speed for the towed equipment(< 4 knots).
2. Use the RGPS beacon/Spectra system to locate the surfaced module requiring replacement
3. Instruct the Instrument Room to power down the streamer - confirm via VHF radio.
4. Raise the retrieval mast on the Work Boat to the correct position for retrieval.
5. At the coxswain's command, lower the retrieval mast into the water and close on the streamer. Optimum position is approximately 12 meters in front of the head of the module to be replaced. Use the hydraulic retrieval system to bring the streamer into the roller position.
6. Attach a Norwegian buoy at the 12 meter mark
7. Lower speed of the work boat to allow it to slide slowly back to the module to be replaced. Remove any acoustic pods or birds on the section.
8. At the tail end of the module being replaced attach the towing clamp/harness when the connection is just aft of the forward roller. **Ensure all personnel are prepared before the attachment, at this point the work boat will be attached to the towed streamer prior to taking the load of the streamer.**
9. Secure the towing clamp/harness to the quick release mechanism on the center of the work boat.
10. Increase power slowly to allow the work boat to tow the streamer aft of the module being replaced. A loop will begin to form just off the starboard side of the work boat. The coxswain should allow a loop of 1.5 to 2.0 meters to form.
11. Remove bad module and replace.
12. When attachment is complete, Via VHF radio notify the mother vessel that the transfer is complete and the streamer is ready for power and quality control testing.
13. When the test is complete, slowly reduce power and transfer the load to the mother vessel. As soon as the transfer of the load is complete activate the quick release mechanism.
14. Remove towing harness.
15. Remove the Norwegian buoy aft of module, move forward on the Module adding acoustic pods or birds where necessary, remove the Norwegian buoy forward of the new section.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 162 of 182

16. Release the streamer from the rollers.

The following procedure shall be observed for replacing **Streamer Sections With the Workboat**.
Notes: It is important to have the correct length of towrope from the tow point to the clamp. The connector needs to be inside the boat for ease in disconnecting and connecting.

Also, personnel must stay on the port side of the streamer at all times during this procedure. In the case of engine failure at this point in the procedure, the workboat would be towed on its starboard beam. It is considered an unsafe act to stand on the starboard side of the streamer during this operation.

The following procedure shall be observed for replacing **Streamer Sections**:

1. The mother vessel should reduce power to the minimum safe speed for the towed equipment(< 4 knots).
2. Use the tailbuoy rGPS beacon in conjunction with the Spectra system to locate the surfaced section requiring replacement.
3. Instruct the Instrument Room to power down the streamer - confirm via VHF radio.
4. Raise the retrieval mast on the Work Boat to the correct position for retrieval.
5. At the coxswain's command, lower the retrieval mast into the water and close on the streamer. Optimum position is approximately 12 meters in front of the head of the section to be replaced. Use the hydraulic retrieval system to bring the streamer into the roller position.
6. Attach a Norwegian buoy at the 12 meter mark
7. Lower speed of the work boat to allow it to slide slowly back on the section to be replaced. Remove any acoustic pods or birds on the section.
8. At the tail end of the section being replaced attach the towing clamp/harness when the connection is just aft of the forward roller. **Ensure all personnel are prepared before the attachment, at this point the work boat will be attached to the towed streamer prior to taking the load of the streamer.**
9. Secure the towing clamp/harness to the quick release mechanism on the center of the work boat.
10. Increase power slowly to allow the work boat to tow the streamer aft of the section being replaced. A loop will begin to form just off the starboard side of the work boat. The coxswain should allow a loop of 1.5 to 2.0 meters to form.
11. Disconnect the tail end of the bad streamer section.
12. With the work boat now towing the remaining streamer, move to port and attach a Norwegian buoy to the head of the streamer under tow by the work boat.
13. Connect the aft end of the new section on the work boat reel to the streamer under tow. Pay out and re-attach the tow harness/clamp and quick release mechanism at the head of the section.
14. Take up tension with workboat reel and remove towing clamp/harness
15. Increase power and slowly move up the streamer under tow by the mother vessel. Once at the head of the bad section use the retrieval mast to pull the streamer into the roller position. Attach the port side tow mechanism with "quick release" to the head of the bad section. Disconnect the bad section and allow it to tow from the port side of the work boat.
16. With enough slack in the streamer towed by the mother vessel, again, 1.5 to 2.0 meters, connect the streamer to the work boat's towed streamer. Work boat position

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 163 of 182

and speed are vital at this stage of the procedure. Use the Norwegian buoy as a reference, position the work boat bow in line with the buoy 2 meters off the starboard side. **Ensure all personnel are prepared before the attachment, at this point the work boat will be attached to the towed streamer prior to transferring the load back to the mother vessel.**

17. Via VHF radio notify the mother vessel that the transfer is complete and the streamer is ready for power and quality control testing.
18. When the attachment is complete, slowly reduce power and transfer the load to the mother vessel. As soon as the transfer of the load is complete activate the quick release mechanism.
19. Retrieve the bad section onto the streamer reel on the work boat.
20. Move back to the rear Norwegian buoy and utilise the hydraulic streamer retrieval system to position the streamer onto the rollers.
21. Remove the Norwegian buoy, move forward on the new section adding acoustic pods or birds where necessary, remove the Norwegian buoy forward of the new section.
22. Release the streamer from the rollers.

In Water Streamer Cleaning

In some areas at certain times of year an ongoing program of cable cleaning needs to be maintained in order to counteract the effects of marine growth, which can cause excessive drag and streamer noise.

Personnel required : 5 workboat crew. Coxswain, Radio Operator and three personnel to perform the cleaning.

Equipment : 2 spare birds, 2 spare pods, 2 spare floats, spare collars (inner and outer), 9 x 1m lengths of 1/8" polypro rope with rubber hose "handles" spliced into one end.

1. Viking II water speed should be in the range 3.8 - 4.5 knots until bird 1 shows to be < 1m depth. From this point on speed change requests are to be communicated to Viking II Navigator by the crew leader. It is the responsibility of the assigned Navigator to evaluate if the requested change can be implemented and passed on to the Viking II Bridge. In the event that the speed change would jeopardize streamer handling then the Crew Leader must be immediately informed.
2. Maneuver workboat alongside cable and retrieve cable just forward of tail buoy slip-ring. Do not put the workboat and crew at risk during any part of the operation and if there is any doubt as to the safety of approaching this close to the tail buoy then retrieve at a safer distance forward.
3. Retrieve cable into workboat roller and lock in position. The Coxswain then slowly runs the workboat forward along each cable section while cleaning takes place.
4. Cable cleaning is to be carried out by three personnel, one positioned forward of the roller, and two aft. The person aft of the roller takes a rope "cleaner". These are pre-

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 164 of 182

constructed from 1/8" polypro rope, approximately 1m long, with short rubber hose "handles" spliced into one end. The rope "cleaner" is tied off to the lifting arm tray and is wrapped TWICE around the streamer. The cleaning action is achieved by pulling the rope tight and allowing the streamer to pass through. Care needs to be taken that the rope does not get caught on modules, weights and collars. Letting tension off the rope and slowing down the vessel when passing these items is suggested. The person holding the cleaning rope should hold it in such a way that is easily let go. **NEVER WRAP THE ROPE AROUND YOUR HAND OR ARM**

5. When the first bird is sighted, the Bow Man signals to the coxswain to proceed slowly until the bird is positioned just fwd of the roller. The Bow Man must remove it and pass to the fourth member of the crew (radio operator), who is positioned aft of the wheelhouse with the standby VHF. This crewmember will then pass a new bird to the aft cable cleaners who attach it once the coxswain has maneuvered the boat so that the collars are aft of the roller. The radio operator then requests that the bird be tested by Viking II Navigation.
6. Once navigation has tested the bird OK, cable cleaning proceeds as before until the next CMU (Cable Mounted Unit) is reached. Meantime the radio operator must clean the removed bird using a wire brush and fixed blade knife. When the next bird is reached the process is repeated, this time the cleaned bird is used as the replacement. The advantage of this method is that it eliminates the waiting time that would otherwise be involved while each CMU is cleaned. The navigator should already have the serial numbers assigned as he knows in advance that bird 2 will be replaced by bird 1, 3 by 2 and so on.
7. The Navigator must monitor progress of the workboat along the cable using the RTT beacon displayed on SPECTRA. As the workboat progresses they will keep three birds fwd of the boat and two birds aft assigned to depth 0. Further birds aft should be set to operational depth.
8. Proceed using the above procedure as far along the cable as it is safe to do so given the speed limitations and sea state. The speed of the Viking II will need to be dropped as the workboat nears the forward ends of the streamers. The Crew Leader must judge this and the operation stopped prior to the tension on the cable affecting the FRC/Norpower boat's ability to disengage from the procedure.
9. Personnel should be swapped between tasks regularly to avoid fatigue and overexposure.

In Water Transfers

The FRC is often deployed and utilized for transferring personnel and supplies from one boat to another. The following in water procedures should be observed:

1. Position FRC alongside the other vessel.
2. Sufficient fenders must be utilized to prevent damage to the FRC, when alongside another vessel.
3. Coxswain should steady the FRC alongside transfer boat. When Coxswain is steady and gives the ok then the transfer can begin.
4. Items transferred between the FRC and any other vessel (chase boat, tail buoy etc.) must be attached with a safety line or be in a net until the items are safely transferred. Personnel being transferred should have a life jacket with, and, when applicable, survival suit.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 165 of 182

Removing Fishing Gear

1. Using beacon positioning if possible, locate the area of streamer that is fouled.
2. One crew member should be placed on the bow to watch for trailing ropes or other material that could foul the propeller. All crew should have a knife to expedite removal of the material. Crew members should be wearing Kevlar gloves while using knife or removing fishing gear as there is often hooks involved.
3. Upon approach to the fouled area, the situation should be assessed and a plan of action agreed on prior to the operation beginning (Management of Change). The risks and hazards in the task are to be evaluated by the coxswain and the crew. The vessel should be notified and the Captain and PM advised of the plan. Once the plan is agreed upon, the coxswain is entrusted to act on it at his discretion. If the operation becomes hazardous, it is to be abandoned for re-appraisal, and the management of change procedure implemented. A second toolbox meeting may be needed to discuss the operation.
4. After approval the workboat can remove the fouling material through a variety of means including cutting the fishing line or long line rope, untangling seaweed, or pulling tape off of bird wings, depending on the situation.
5. Communication is essential; updates should be given by a crew member not directly involved in removing the fouling agent or driving the workboat. The coxswain should not be expected to answer radio calls during this operation, as their concentration is needed to ensure the workboat stays properly positioned.

Ballasting

1. Insure all tools and materials needed for ballast works are in the workboat.
2. Using beacon positioning if possible, locate the area on the designated streamer needing ballast work.
3. Adjust the speed of the workboat to pace along side the streamer, using the bulkheads as a reference for pacing.
4. Keep station 2 meters off to the port side of the streamer.
5. Raise the retriever arm up and out, into the ready position, then lower the mast into the retrieve position.
6. Insure all crew are positioned for the job and ready to move in on the streamer.
7. On the coxswain's signal, guided by the ops leader, move in on the streamer.
8. Once in position over the streamer, the ops leader can then raise the streamer out of the water and lock the mast in place.
9. The ops leader can now guide the coxswain forward or backward to the area requiring ballast adjustment.
10. Add or remove lead as required, preferably using clamp-on style weights.
11. On the coxswain's signal, prepare to release the streamer. *if using the aft roller, it must be released first.* Upon lowering of the streamer back into the water, speed up a little and pull away to port.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 166 of 182

12. Move on to the next area, circumventing birds and pods, and repeat steps 1-11 as needed.
13. Report to instrument room upon completion of each task. The instrument room should be aware that while ops are under way, the workboat may not be in communication at all times. If the instrument room requires a status check from the workboat during ops, and between regular communications checks, the instrument room should get a visual "situation normal" confirmation from the chase boat. This will eliminate the possibility of the coxswain's attention being drawn from the job at hand.

Visual Check of Gear

1. Adjust speed to pace along the inside of the Barovane at a safe distance of about 2- 3 meters.
2. The coxswain should be aware of the "bail out" procedure for this operation. The "bail out" procedure states that in the event the workboat gets caught inside the rolling water (vortex) caused by the Barovane, he/she should increase speed and execute a *starboard* turn forward and around the Barovane. **Reasoning: A port turn will put the propeller further into the strap leg area, and force the stern of the workboat further into the vortex, next to the Barovane. This procedure is for inspecting the starboard vane. The reverse should be used when inspecting the port vane.**

Towing

Towing fishing gears and logs

1. Use the slide off bar together with the quick release hook when towing fishing gears and logs away from streamers, tail-buoys, head floats or any of the equipment towed by the seismic vessel
2. Always be ready to release the tow if the boat goes out of control for any reason
3. Continuously inform the Coxswain to avoid confusion and keep control of the workboat
4. The "leader" in the boat does not take part in the task, and is assigned to monitor the operation in respect to safety and keeps the Coxswain informed
5. Maintain communication with the mother vessel on the progress of the task.

Towing tail-buoys

1. Make ready a towing rope for the workboat and attach a small Norwegian buoy to be picked up by the workboat when the tail buoy is in position. The tow rope should be approximately 15 meters long with a "quick link" in the end. Place another Norwegian buoy to the rope towed from the seismic vessel as a reference point to hook up the bad tail buoy later in the operation. This rope should be hooked to the tailbuoy tow rope with a "quick link".
2. Deploy the tail buoy from the stern of the mother vessel and pay out until the tail buoy reach behind the head floats.
3. Instruct the Coxswain to maneuver the boat in position to pick up the small Norwegian buy
4. Do not attach the towing rope but hold it until the tail buoy is released
5. Move up in front of the tail buoy and disconnect the towing rope from the longer rope running to the mother vessel.
6. Attach the towing rope in the quick release and move out on either side of the streamers. Move out of range of the streamers in order to not being caught in a bird or similar if the tow goes deep.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 167 of 182

7. Stop the workboat and disengage the propeller while the crew make the tail buoy ready to be towed and connected at the tail of the streamers

Towing Canoes or similar sized objects

1. Connect the tow in the quick release onboard the workboat and connect the other end to the bow of the canoe
2. Keep one man ready to release the tow in case of any problems
3. Coxswain find a safe heading too pull the canoe away. It is important to take up tension slowly.
4. Tow in a straight line as a canoe easily capsize when the workboat makes a turn

Recover the workboat or the FRC in case of engine failure

1. Use a quick release hook on the towing boat
2. Be ready with a knife or axe to cut the tow if the quick release fail.
3. Use a short towing rope between the two boats
4. Maneuver the towed boat in position to connect the bowline and slow down until the bowline got the tension
5. Release the tow or cut the tow when the towed boat is secured in the bowline.
6. Move out and stand by in a safe distance until the boat with failure is hoisted out of the water

Towing the Paravane

1. Towing the Paravane is restricted to port calls when the Paravane needs to be moved in range of a crane or other lifting device.

Recovery of Lost Equipment

1. The chase boat will be instructed to standby the tail-buoy(s) until the weather is suitable for deployment of the workboat.
2. Load the Workboat with a new streamer section prior to launch
3. Load the Workboat with spare birds and pods
4. Locate the connector at the head of the broken streamer section and pick up the streamer
5. Place a Norwegian buoy 12 meters in front of the connector, on the tail of the section in front of the broken streamer section
6. Drop back to the connector and attach the clamp to the "clamp on point" at the head of the broken streamer section
7. Attach the clamp into the quick release hook and ask the Coxswain to slowly take up tension
8. Disconnect at the head of the broken streamer and fit an end cap on the tail of the streamer towed from the mother vessel.
9. Drop the streamer off the tray and move out to port
10. Transfer the broken section to the chase boat.
11. Prepare the boat for towing the broken streamer.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 168 of 182

12. To save time and minimize manual handling, instruct the chase boat to tow the tail buoy backwards until the separated streamer comes to the surface
13. Maneuver the boat alongside the streamer on the surface and lower the arm into ready position
14. When all the crew is ready and on the Coxswains signal move in and pick up the streamer
15. Lift the arm up and into "work position"
16. Slow down the boat and allow the streamer to pass all the way to the connector at the head of the broken section
17. When the connector at the head of the broken section is located instruct the chase boat to slow down and cut the tow.
18. Slow down and stop the workboat in position alongside the streamer connector
19. Disengage the propeller.
20. Attach the "Streamer tow clamp" to the "clamp on point" at the head of the good section behind the broken section
21. Disconnect the tail of the broken section and coil the broken section in the front of the workboat
22. Or attach a Norwegian buy to the broken section and leave it in the water for the chase boat to pick it up
23. Engage the gear and move forward to catch up with the tail of the broken streamer (marked with a Norwegian buoy)
24. Connect the new section on the winch onto the head of the streamer towed from the workboat.
25. Transfer tension from the towing point to the winch and remove the "Streamer tow clamp"
26. Deploy the new streamer as you move forward to catch up with the tail of the broken streamer towed from the mother vessel
27. When the "new section" is fully deployed attach the "Streamer tow clamp" to the "Clamp on point" at the head of the "new section"
28. Pick up the tail of the streamer towed from the mother vessel
29. Keep enough slack of the streamer onboard the workboat to be able to connect the tail of the streamer from the mother vessel onto the head of the streamer towed from the workboat
30. Ask the Coxswain to develop a loop by the streamer just in front of the "cable retriever rig" in order to get more room for safe maneuvering
31. Connect the tail of the streamer towed from the mother vessel onto the head of the streamer towed by the workboat
32. Have recording room test streamer.
33. Ask the Coxswain to gently slow down in order to transfer the tension from the workboat onto the streamer towed by the mother vessel
34. Just before the tension passes onto the streamer release the quick release hook
35. Remove the clamp from the side of the workboat

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 169 of 182

36. Move forward and remove the Norwegian buoy.
37. Move out to port and drop the streamer off the “tray”
38. To replace birds and pods please see the work-instruction “15 Changing birds and pods”

Tail-Buoy Maintenance

1. Locate the tail-buoy and make ready to transfer one person onto the tailbuoy.
2. Approach the tail-buoy keeping the tail-buoy at the bow (Forward for the Workboats pivot point)
3. If possible complete repairs without boarding the tail buoy, otherwise, one person boards the tail buoy on the Coxswains signal.
4. The Coxswain is ready to slow down or turn to port when the person is safely onboard the tail buoy.
5. Workboat stands by behind the tail buoy and out to port, out and away from the keel water from the tail buoy in case the person falls off the tail buoy
6. Report to the instrument room “One crewmember onboard the tail buoy”
7. Approach the tail buoy and hand over tools, battery, antenna, beacon or whatever is requested from the crewmember onboard the tail buoy
8. The Workboats “Team leader” is responsible for communication between the instrument room and the person on the tail buoy.
9. Report to the instrument room when the job is complete and ready for testing.
10. Approach the tail buoy and recover the person from the tail buoy.
11. Report to the instrument room “Crewmember safely onboard the workboat, mission complete, heading back or underway to the next mission”

Transport of Equipment/Personnel

Transport of equipment using the Workboat or the MOB boat is not the preferred method of transfer and should be considered only when the vessels cannot complete a boat-to-boat transfer operation. Personnel transfer is not permitted between the Veritas Viking II and a support vessel and as such the Workboat or FRC is to be utilized.

The mission is restricted to good weather and limited to the transport of small lightweight goods or personnel. Cargo nets are prohibited but plastic bags designed and certified as lifting appliances (Salt sacks) can be used when the support vessel has a crane.

26. Evaluate the weather.
27. Plan the mission in respect of the following
28. Weather conditions.
29. Type of cargo and quantity
30. Crane position and functionality on the Chase boat.
31. Crane position and functionality on the Seismic vessel
32. The use bowlines when alongside
33. Communications
34. Daylight hours
35. PPE

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 170 of 182

36. The position of the mother vessel during the operation. Is it in a turn during the mission?
37. Do not exceed total cargo weight or personnel capacity of the small boat.
38. Complete the toolbox meeting and get permission for the planned mission.
39. Instruct the Chase boat about the plan.
40. Abort the mission if the weather is unsuitable or the crew is unable to safely complete the task.
41. Get alongside the Chase boat (support vessel) and deliver the plastic bags designed for lifting, if required send a crewmember onboard to advise the crew on the planned mission and how to organize with maximum load.
42. In the case of personnel transfer wait until the support vessel's deck crew and the small boat coxswain give permission to transfer. Only one person is to transfer at any one time. Once a person has transferred they should move away from the embarkation/disembarkation area and be ready to assist as directed.
43. Use the crane to get the load down in the workboat.
44. Report to the bridge on the seismic vessel "Cargo onboard, heading back for offloading"
45. Use a bowline (adjusted to fit for the range of the crane).
46. Unload the cargo from the workboat.
47. Move forward and release the bowline.
48. Report to the Chase boat "Heading back to pick up the next load/persons".
49. Report to the Bridge on the seismic vessel "Mission complete, heading back for retrieval"

Changing a Tail Buoy

1. Pre-launch, launch and recovery checks and procedures as usual.
2. Deploy the new tail buoy from the stern of the seismic vessel.
3. Follow work instruction for deploying the tail buoy and to take the tail buoy under tow from the Workboat.
4. Take new tailbuoy to support vessel to tow until needed. (may have to use FRC).
5. Locate the tail buoy in place and pick up the stretch behind the pinger.
6. Attach a Norwegian buoy behind the pinger.
7. Drop back to the connection point between the stretch and the chain.
8. Ask the instrument room to power down the streamer and to confirm when the power is off the streamer.
9. Fit the towing harness to the head of the chain and secure the towing harness in a quick release.
10. Ask the Coxswain to slowly take up tension until there is slack enough to disconnect the chain and the stick cable.
11. Fit end caps to the mail and female connectors for the stick cable.
12. Place a Norwegian buoy to the chain and release the tail Buoy from the Quick release and remove harness.
13. Support vessel can unhook good tailbuoy with Norwegian buoy attached to tow line.
14. Tow bad tailbuoy to support vessel and have them take it under tow.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 171 of 182

15. Recover good tailbuoy and proceed back to streamer.
16. Recover end of streamer and pick up ahead of buoy using mechanical arm.
17. Slide back to end of stretch section and fit towing harness.
18. Connect the new tail buoy to the tail stretch.
19. Connect the stick cable.
20. Release the tail buoy from the support vessel and remove the towing harness from the chain.
21. Move forward and remove the Norwegian buoy.
22. Report to the instrument, power up and test.
23. Drop the stretch off the tray and move out to port.
24. Take the bad tail buoy and tow the tail buoy back to the seismic vessel.
25. Hook up the tail buoy to the rope paid out from the stern of the seismic vessel and release the tow from the workboat.
26. Report to the instrument room "Mission complete, heading back for retrieval".

Changing a STIC Cable

1. Locate the tail buoy in place and pick up the tail stretch behind the pinger.
2. Place a Norwegian buoy to the stretch behind the pinger.
3. Drop back until the connection point between the chain and the stretch is on the side.
4. Ask the instrument room to power down the streamer and get it confirmed when the power is off the streamer.
5. Attach the towing harness to the chain and secure the other end into the quick release.
6. Ask the Coxswain to take up the tension until there is enough slack to disconnect the chain and stick cable.
7. Fit end caps to the male and female connectors.
8. Drop the tail stretch off the tray and back in the water.
9. Slow down, stop the workboat and disengage the propeller.
10. Change the stick cable and secure it with new tie raps.
11. Move up forward and pick up the tail stretch behind the Norwegian buoy.
12. Slow down until the connection point is in range to be connected to the chain of the tail buoy.
13. Connect the chain and the stick cable.
14. Release the tow from the quick release hook.
15. Move forward and remove the Norwegian buoy.
16. Power up and test.
17. Drop the stretch off the tray and move out to port.
18. Report to the instrument room "Streamer released from the workboat, heading back for retrieval".

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 172 of 182

Tail Buoy Entanglement

1. Tangled tail buoys are like a big loop of streamer in the water. There is a high level of drag on the streamers.
2. No small boat should be inside that loop with the streamer in the tray due to the drag. The drag will push the boat sideways and might capsize the boat before the crew even realize they are in trouble.
3. No small boat should be in range of the tail buoys when they become loose, as they will return to their normal positions with the speed of a jet boat.
4. No small boat should try to tow the tail buoys in attempt to pull them loose from each other.
5. Pre-launch, launch and recovery checks and procedures as usual.
6. Locate the tangled tail buoys and stay out of range in case the tail buoys become loose.
7. The Workboat is only used to observe the progress and to report to the instrument room.
8. The tail buoy movements must be controlled from the instrument room: bringing the streamers up and down, shorten or lengthen the streamers, initiate a turn.
9. Use the Chase boat to observe and report if possible.

Reporting

All Small boat/FRC operations are logged by the Party manager and Bridge and counted on the monthly statistics.

8.11 Streamer Head (Prism) Float Deployment and Recovery

Streamer Head (Prism) Float Deployment and Recovery Procedures

Personnel

Personnel Performing Operation : Gun Mechanic/Observer
Minimum Number of Personnel : Three (3)
Duties : 1-Performing Unit Attachment (Gun deck)
1-Performing Unit Attachment (Cable deck)
1-Operation Observer
Supervision : Senior Mechanic/Observer
Job Safety Analysis : Mechanics/Observers

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Hard Hat, Work Vest and Tether Harness for person on gun deck.
Recommended : Work Gloves, Back Protection.

Overview

A head float is located at the head of each streamer, just behind the bend restrictor on the armored lead-in. It is attached to the armored lead-in via a plexus rope. The head float is torpedo-like in shape, with a triangular fin at the rear to facilitate a steady tow. Above and near the head is a welded pole upon which is mounted a reflective prism and/or Buoylink beacon. The head float is deployed and retrieved via the gun chute, and is secured safely on the gun deck when not in use.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 173 of 182

Potential Hazards

- Personnel are working near the stern without the stern fence in place.
- Rope attachments from the streamer to float can cause tangles and be a trip hazard.
- Ropes under tension
- The head float is bulky and quite heavy.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.
- Recovery Procedure

When the head float is at the stern of the vessel the tugger winch rope, from the streamer deck, is attached to the tag line by person performing duties on the streamer deck. The quick release shackles are then removed and the tugger winch rope from the gun deck is attached and the head floated is pulled up onto the gun deck via the gun chute

Attachment Procedure

A rope stop is placed at a pre-determined location on the armored lead-in.

The head float, located on the gun deck, is connected to this rope stop via plexus rope and quick release shackles.

The head float is deployed out of the stern down the central gun chute manually.

8.12 Hull Pinger Deployment and Recovery

Hull Pinger Deployment and Recovery Procedures

Personnel

Personnel Performing Operation : Navigator/Gun Mechanic
 Minimum Number of Personnel : Two (2)
 Duties : 1-Open/Close Sea Chest
 : 1-Position Hull Pinger
 Supervision : Chief Navigator
 Job Safety Analysis : Senior Navigator

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Hard Hat, Ear Defenders
 Recommended : Work Gloves, Back Protection

Overview

The Hull Pinger is composed of a six meter sealed tube of stainless steel, which at its base is connected to an acoustic pinger. The Hull Pinger is deployed below the hull of the vessel, via the sea chest, just before production commences within a survey. The Hull Pinger is ALWAYS retracted if the vessel needs to go faster than the maximum equipment towing speed (5.5 knots), or if it is entering an area of extremely shallow water (e.g. a harbor area).

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 174 of 182

Potential Hazards

- The Hull Pinger is located in the Compressor room, which is not a normal working area for the seismic crew.
- The Compressor Room is noisy, ear defenders have to be worn at all times.

Preventative Measures

- Training of personnel in the operation before deployment on the team.
- Use of additional protective equipment as the conditions merit.

Deployment Procedure

1. Turn valve to open the sea chest so that the Hull Pinger can be deployed below the hull of the vessel.
2. The Hull Pinger is manually lowered under it's own gravity the maximum extent and then secured.

Retrieval Procedure

1. There is a block and chain pulley, which pulls the Hull Pinger completely within the vessel.
2. Make sure the Sea Chest is closed completely to the open sea.

8.13 Working Aloft

Working Aloft Procedures

Personnel

Personnel Performing Operation: Climber, Spotter

Minimum Number of Personnel : Two (2)

Duties : 1-Climber
1-Spotter

Supervision : Chief Navigator

Job Safety Analysis : Senior Navigator

Personal Protective Equipment

Minimum P.P.E. Required : Work Boots, Work Gloves, Hard Hat, Harness, Lanyard

Recommended : 2 VHF Radios

Overview

Working aloft becomes necessary, at times, to repair critical navigation, satellite, and other equipment. Working aloft, on the mast, walkways, and other elevated areas is controlled by the Permit to Work system. The completion of the work permit is required before any work can begin where personnel are required to work in exposed elevated areas. The vessel Master or Officer on Watch shall approve the work permit.

Potential Hazards

- Slips and falls from the mast, walkway, or other elevated area.
- Radiation exposure from radars, VSAT, Marisat
- Falling tools and parts

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Safety Critical Geophysical Operations Procedures.		Page 175 of 182

- Communication problems
- Vessel movements due to wind and sea conditions.
- Electric shock from cables on mast and walkway.

Preventative Measures

- Training of personnel in the operation before assignment.
- Use of PPE, including harness, lanyards, hard hat, nonskid boots.
- Ensuring relevant radiation sources are locked out/tagged out
- Communication tests prior to climb.
- Wind and seas are noted on Permit to Work and approved by Master or Officer on Watch
- Proper labeling of all cable runs.

Restrictions

Weather conditions must be within an acceptable level to perform the operation safely. The Master, or Officer on Watch, and the climber must approve the work permit, listing the current weather conditions, prior to the commencement of the task. Winds and seas above Beaufort Scale 5 shall be considered the highest limit to working on masts.

Standard Operating Procedure

1. The minimum manning level for any work aloft is two persons, a Climber and Spotter.
2. A Permit to Work form is completed
3. All necessary tools and equipment are gathered at the base of the ladder.
4. Complete inspection of PPE, including climbing harness and lanyards.
5. Communication tests are carried out between the Climber, Spotter, Bridge, and Instrument Room.
6. Ensure all relevant radiation sources are Locked out/Tagged out.
7. Proper climbing technique is to use a hand over hand movement on the ladder rungs. Do not slide hands up the sides of the ladder. Use lanyards during the climb one over the other to ensure the climber is constantly attached to the ladder.
8. Spotter keeps area under the work clear of all personnel
9. Use lines and tool buckets to limit the amount of equipment on the Climber.
10. Before descent ensure no tools or loose parts remain on the walkway or platform.

Document: SR/V Veritas Viking II Safety Case Custodian: QHSES Coordinator Approved: Operations Supervisor	Version: Date Issued: Date Printed:	Rev 4 Dec 01, 2005 Dec. 1, 05
Title: Misc. Sample Forms.		Page 176 of 182

09. Misc. Sample Forms

9.1 Examples

Work permit form is for example purposes only. Form used onboard will conform to vessel operator standard.

FRC/WORK BOAT CHECKLIST

Have the Master and Party Manager been informed and given permission for the operation? **YES NO**

Has a toolbox meeting been conducted with all crewmembers present? **YES NO**

Do all crew members understand the "management of change" procedures governing workboat operations? **YES NO**

Do all crew members agree the work proposed can be conducted safely considering the current weather conditions and tasks? **YES NO**

Has the FRC/Work Boat been inspected prior to launch? **YES NO**

Are all required safety items onboard(first aid, sunscreen, liquids, hand held VHF, etc.)? **YES NO**

Are all tools/materials required to perform the operation onboard? **YES NO**

Launch date

Time out Time in

Wind speed (Knots)..... Are all crew wearing lifejackets? Hard hats? **YES NO**

Visibility(Miles)

Sea state (Meters)Are all crew wearing survival suits? **YES NO**

Back up vessels.....

Work Area VHF Ch in use.....Radio check.....RTT Beacon **YES NO**

Type of work to be performed

Estimated time for operation

Actual time for operation.....

Signatures of crewmembers:

1) 4)

2) 5)

6)

WORKBOAT CHECK LIST

DATE: _____

SIGN: _____

SAFETY CRITICAL, PRE-LAUNCH

Check:

- | | |
|-----------|--|
| 1 | Bowline is connected and in good condition |
| 2 | Oil level |
| 3 | Cooling water level |
| 4 | Fuel enough for the planned mission |
| 5 | Fuel shut off valve is open |
| 6 | Raw-water inlet valves (2) is open |
| 7 | Oil level on gear box |
| 8 | Oil level on Hydraulic |
| 9 | Functions operated from the electric panel |
| 10 | First aid kit onboard |
| 11 | Pyrotechnics onboard |

	YES	NO

REMARKS:

Description:	
Responsible: _____	Target date: _____

EMBARKATION POINT CHECK LIST

DATE: _____ **SIGN:** _____

SAFETY, PRE-LAUNCH

Check that all crew wear:

- 1 Constant wear suit (in cold areas)
- 2 Inflatable life-jacket
- 3 Workboat helmet
- 4 Sun screen in warm areas
- 5 Protective shoes
- 6 Is bowline in correct position
- 7 Is FRC bowline out of way

	YES	NO
1	<input type="checkbox"/>	<input type="checkbox"/>
2	<input type="checkbox"/>	<input type="checkbox"/>
3	<input type="checkbox"/>	<input type="checkbox"/>
4	<input type="checkbox"/>	<input type="checkbox"/>
5	<input type="checkbox"/>	<input type="checkbox"/>
6	<input type="checkbox"/>	<input type="checkbox"/>
7	<input type="checkbox"/>	<input type="checkbox"/>

COMMUNICATION

Check that:

- 8 The workboat is equipped with a minimum of 2 fully operational radios
- 9 Perform a radio check on decided channel
- 10 Both radios are able to work on channel 16

	Yes	No
8	<input type="checkbox"/>	<input type="checkbox"/>
9	<input type="checkbox"/>	<input type="checkbox"/>
10	<input type="checkbox"/>	<input type="checkbox"/>

OTHER DUTIES

- a) Open and close the door at the embarkation point
- b) Unhook/hook chains.
- c) Help the workboat crew to load and unload the boat
- d) Make ready the water hose at the embarkation point
- e) Secure the area to make sure nobody is falling overboard

POST MISSION CHECK

- 11 Re-fuel
- 12 Wash down the boat using fresh water
- 13 Tools, survival equipment and anything else that may have been used, cleaned up and made ready for next deployment
- 14 All tools accounted for and checked off

	YES	NO
11	<input type="checkbox"/>	<input type="checkbox"/>
12	<input type="checkbox"/>	<input type="checkbox"/>
13	<input type="checkbox"/>	<input type="checkbox"/>
14	<input type="checkbox"/>	<input type="checkbox"/>

Tailbuoy Equipment Check List

The operational condition of the deployment, and retrieval, equipment is checked well before any Tailbuoy work is required. Directly prior to Tailbuoy work, the following equipment checklist is performed:

For Tailbuoy Launch Procedure refer to Safety Critical Geophysical Operations Procedures in the Veritas Marine Safety Management System)

Tail buoy Pre-launch Checks

Nº	Item Description	Check
1	Toolbox Meeting	
2	Description of work defined and discussed.	
3	Safe Work Area defined and clearly mapped.	
4	Verify serial number of RGPS beacon and float to be deployed.	
5	Inspect hull, tow points and tow harness for physical damage or fatigue.	
6	Ensure all hardware (bolts/shackles etc) are in good condition and secure.	
7	Ensure any watertight compartments are secure and dry.	
8	Inspect Stic cable for sufficient slack with respect the tow harness and for wear at critical points.	
9	Ensure the tag line is in good shape, the correct length and not twisted around stic cable.	
10	Inspect Telemetry antenna and coax for signs of fatigue or damage.	
11	Ensure RGPS mount is secure and in good shape.	
12	Ensure battery is fully charged and secure.	
13	Ensure that the tail buoy strobe light is on and working.	
14	Ensure that all connections from the stic cable to the battery, and the RGPS pod to the battery are secure and water tight when using an active tail buoy.	
15	With streamer powered-up and tailbuoy power module enabled, assure correct voltage and amperage in the Syntrak Operator screen with the battery disconnected and using the battery bypass jumper. Once confirmed, remove bypass and reconnect battery.	
16	Confirm tail buoy correctly configured in Spectra and have good communications to beacon on deck prior to launch.

Streamer Equipment Check List

The operational condition of the deployment, and retrieval, equipment is checked well before any foreseen Streamer work is required. Directly prior to Streamer work the following equipment check list is performed:

Nº	Item Description	Check
1	All level controllers (Birds) fully functional	
2	All hand tools (allen keys, "C" Spanners, wrenches etc.) are at the ready.	
3	All required crew PPE prepared and ready.	
4	All recommended PPE on location and ready.	
5	Tool-box Meeting (Master/OOW, Party Manager, Observer, Navigator.	
6	Description of work defined and discussed.	
7	Safe Work Area defined and clearly mapped.	
8	Air Brake fully functional.	
9	Hydraulic Controls fully functional.	
10	All alternative hydraulic start/stop points positively locked out.	
11	All communications fully functional.	
12	All Fire Fighting appliances at hand and fully functional.	
13	Manual Brake fully functional.	
14	Life rings and smoke canisters in correct locations.	
15	Streamer and canister summaries, and serial number listings on hand.	
16	Work list on hand.
