1 INTRODUCTION

The 534 km² (including well-tie lines) Greater Bream 3D marine seismic survey was acquired in the Bass Strait between 22nd April and 13th July 2006 for Esso Australia Pty. Ltd. The survey area is located approximately 50 kilometres south of Lakes Entrance, Victoria, offshore Australia. The location of the survey is displayed in Figure 1.

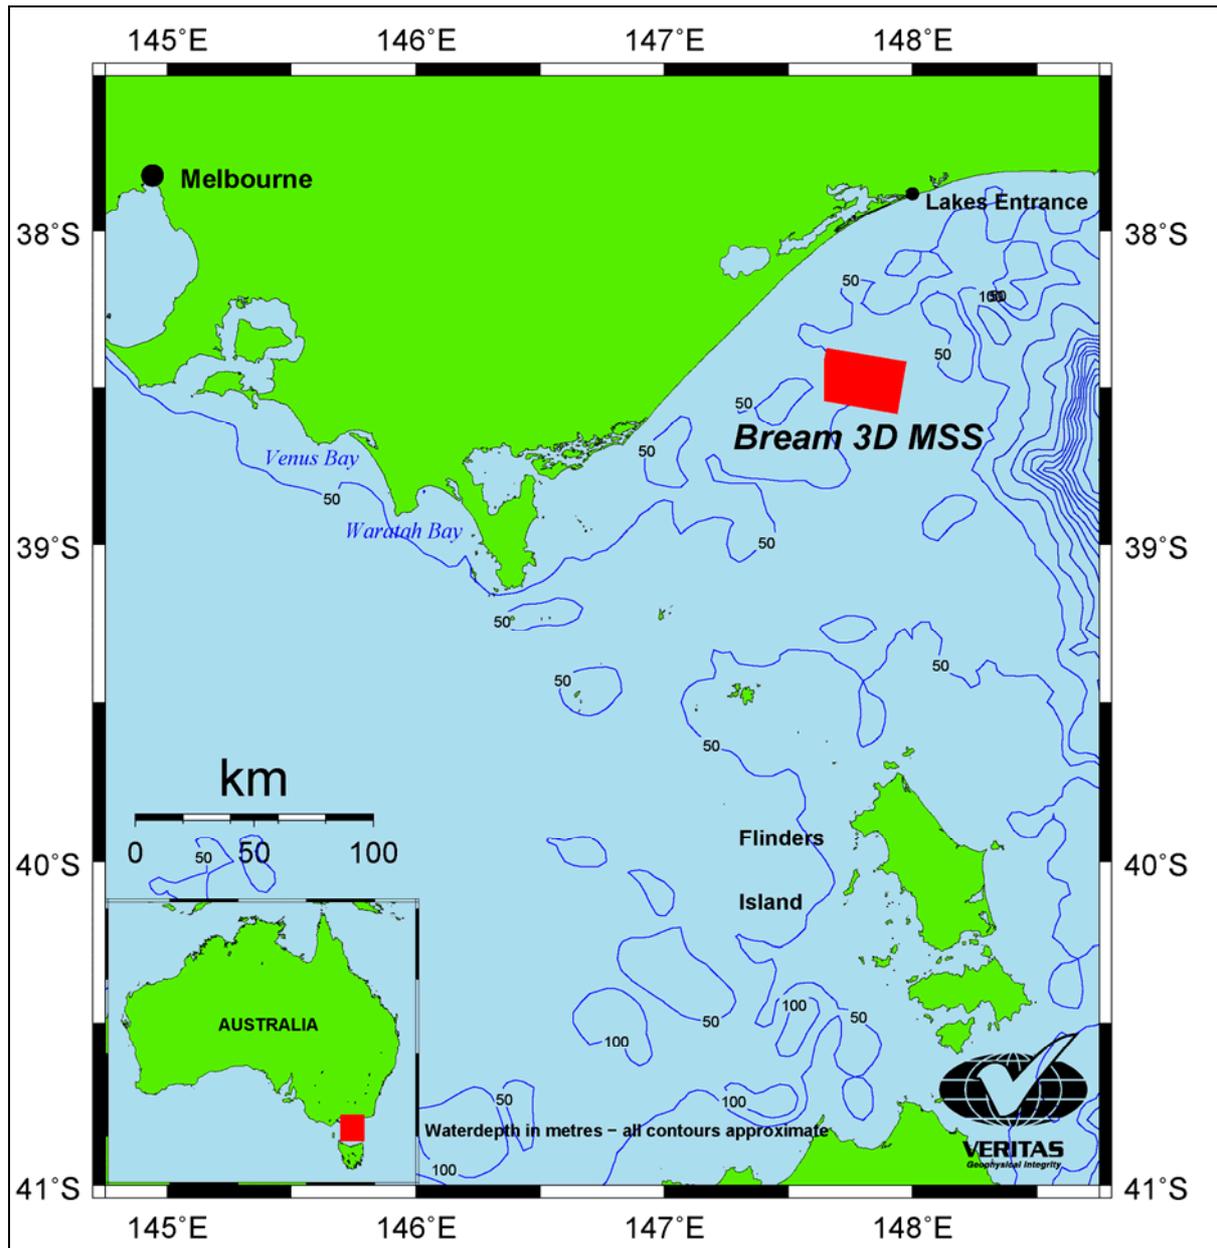

Figure 1: Location of survey

The objectives of the survey were three-fold:

- Improve definition of current reservoir (1600-2200 ms) and strata below 2200 ms
- Use as a baseline for a future 4D monitoring programme
- Confirm prospect to the north of existing Bream A and B producers

When acquisition was completed, the program comprised 32476.5 prime CMP-kms including run out shot points, 18147.9 infill CMP-kms, 124.5 reshoot CMP-kms and 1053.3 CMP-kms of 2D tie lines (charged at 16 CMPs). Over the 57 days production period, a daily average production of 908.8 CMP kilometres was achieved; equivalent to 56.8 sail-kms.

Upon completion, 29.3% of the total survey time¹ was spent in production or associated line-change chargeable time. The remaining 70.7% of the time was accounted for as various categories of mobilisation, regional (weather related) and technical downtime.

The dual source, eight-streamer configuration in use for this survey dictates an acquisition geometry that produces a 6.25x18.75 m bin grid, with 16 subsurface lines being acquired on each vessel pass.

1.1 SURVEY PARAMETERS

The main survey parameters are listed in the following table:

SURVEY DEFINITION

Client name	Esso Australia Pty. Ltd.
Survey name	2006 Greater Bream 3D MSS
Survey location	Gippsland Basin, Bass Strait, Australia
Veritas job number	20323
Shotpoint interval	18.75 m (37.5m per energy source)
Line orientation	10.5/190.5

¹ Inclusive of the undershoot vessel timing which included both mobilization and demobilization from Indonesia

STREAMER

Number of streamers	8
Streamer active length	4500 m
Streamer type	Thales Guardian Twinax Solid Streamer
Streamer separation	75 m +/- 7.5 m (overall 525 m +/- 18.75 m)
Number of groups per streamer	360
Group length	12.5 m
Streamer depth	7 m +/- 0.5 m
Inline offset	75 m
Depth controllers	DigiCOURSE Model 5011 spaced < 300 m

RECORDING PARAMETERS

Record length	6 seconds (6144 ms recorded)
Sampling rate	2 ms
Low cut filter	3(12) Hz (dB/oct)
High cut filter	206(276) Hz (dB/oct)
QC analysis display low-cut filter	5(18) Hz (dB/oct)
Recording format	SEGD-8036 (24-bit integer)
Recording media	3590 data cartridge
Fold of data	60
Auxiliary traces	12 (11 near-field + 1 combined near-field/time break)
Recording time delay	0

ENERGY SOURCE

Source type	Bolt 1500LL & Bolt 1900LLXT
Number of sources	2
Source array depth	6 m +/- 0.5 m
Source length	16.5 m (16.0 m on Pacific Sword during undershoot)
Gun synchronization	+/- 1.0 ms
Nominal air pressure	2000 psi (minimum 1900 psi)
Volume	4450 cu in
Undershoot vessel gun volume	4550 cu in single source.
Source centre-centre separation	37.5 m +/- 3.75 m
Sub-array separation	8 m +/- 1.5 m
Number of sub-arrays	3

NAVIGATION

Primary Navigation System	Veripos Ultra
Secondary Navigation System	Veripos Standard
Tertiary Navigation System	C-Nav
Steering Position Layback	CMP (inline midpoint between guns and first-group)
Run out shot points to achieve full-fold	120 (does NOT include the 5 shots for navigation processing)
Shooting Mode	Dual source flip-flop
Undershoot Shooting Mode	Single source (2 passes of each line required)
SOL run in	6750 m (1.5 x streamer length)
Offset zones	4 (bin scale MUST display actual hits per bin, not percentages)

POSITIONING PARAMETERS – ACQUISITION & PROCESSING

Acquisition Datum	WGS84
Spheroid	WGS84
Semi-Major Axis	6378137.000
Inverse Flattening	298.257223563
Projection	UTM
Zone	55S
Origin Latitude	0°00'00" N
Central Meridian	147°00'00 E
False Easting	500000
False Northing	10000000
Scale factor at Central Meridian	0.99960

2 FIELD OPERATIONS

This section provides a general overview of the significant operational aspects of the Greater Bream 3D marine seismic survey. Detailed information concerning specific survey lines and events is included in the Supporting Documents section of the CD-ROM.

2.1 GENERAL OVERVIEW

The accounting for the survey starts at 00:00 hours on 22nd April 2006.

The SR/V Veritas Viking II mobilised for the survey in the port of Fremantle, West Australia. Various calibrations and upgrades were carried during the port call and subsequent transit to the prospect area. On 28th April, the vessel arrived in the prospect and started to deploy the trailing gear. Incoming severe weather necessitated retrieving the partially deployed gear 3 days later; deployment was restarted on 5th May. On 11th May, the spread was deemed to be in a contractually acceptable condition to acquire the first line, G06A-1440P2-004 (sail sequences 1 and 2 were acquired as test lines, sequence 3 was determined to be DNP).

Phase 1 of the survey covered the definition of the undershoot area around existing production platforms Bream A and B. The undershoot vessel to be used was the Pacific Sword which began mobilization from Singapore on the 25th April and arrived on station on 12th May. By 19th May, seismic data coverage was sufficient around the platforms in order to commence the undershoot stage. Adverse weather, technical issues and the fact that the Pacific Sword employed only a single source caused the undershoot phase to take 12 days. The undershoot stage was completed by line G06A-1520U7 on 30th May, and the Pacific Sword departed from the prospect area. Demobilization for the Pacific Sword ended at 24:00 on the 11th June when she arrived back in Indonesia.

Phase 2 covered the acquisition of the conventional single vessel lines to the East of the Bream A platform, Phase 2 commenced with line G06A-1168P1-058 on 30th May 2006, and prime acquisition of this area was completed with line G06A-1312F5 on 18th June 2006.

Phase 3 consisted of the area to the West of the Bream A platform, and commenced with line G06A-1904F1-117 on 18th June 2006. Prime acquisition of Phase 3 was completed by line G06A-2208P1-179 on 02nd July 2006.

The survey was deemed complete after acquisition of sail line G06A-1104F2-198 on 06th July 2006 at 21:27 hours. Upon completion, the trailing gear was recovered and the vessel

steamed for the port of Fremantle. The time accounting for the Greater Bream 3D survey ends at 24:00 hours on 13th July 2006.

2.2 OPERATIONAL FACTORS

2.2.1 WEATHER

Weather and sea state were variable over the survey period. Periods of minimal swell and low winds were alternated with very rough sea state and high winds. Since data were only acquired during relatively calm periods, swell noise and other weather-induced degradation was kept to a minimum.

2.2.2 CURRENTS AND TIDES

Tidal heights in the prospect area are small, in the range of +/-0.7 metres from Mean Sea Level. Esso Australia supplied predicted tidal and current information prior to the survey start. By client request, the tidal information was not used to correct the recorded bathymetry data. It was used to apply static corrections to the seismic data (in the order of +/- 1.0 ms) during the onboard processing stages.

Currents in the area were strong during tidal springs (which happened during the undershoot stage). The supplied current information proved extremely useful in planning safe close passes to both platforms.

Feather angles during the survey were generally within the range of +/- 10°, and on occasion more than this. The feather was not consistent between adjacent lines and this is reflected in the high infill percentage upon completion.

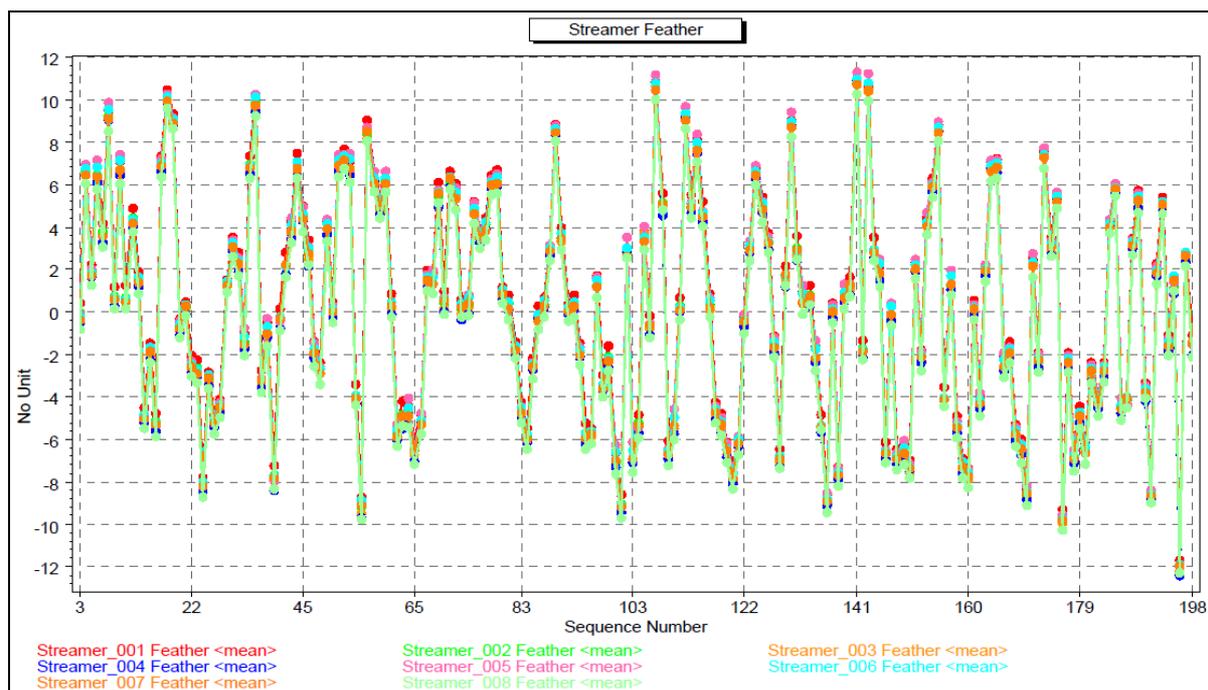

Figure 2: Average feather angles during survey displayed per sail sequence

2.2.3 OBSTRUCTIONS AND WATER DEPTH

Two fixed platforms – Bream A and the unmanned Bream B, approximately 6 km apart, were present in the prospect area and required undershooting. The M/V Pacific Sword was used as the source boat for the undershoot lines.

Water depths range between 40 to 60 metres inside the survey area. A bathymetry map (using data from the vessels echo sounder as supplied in the processed navigation data) is displayed in Figure 3.

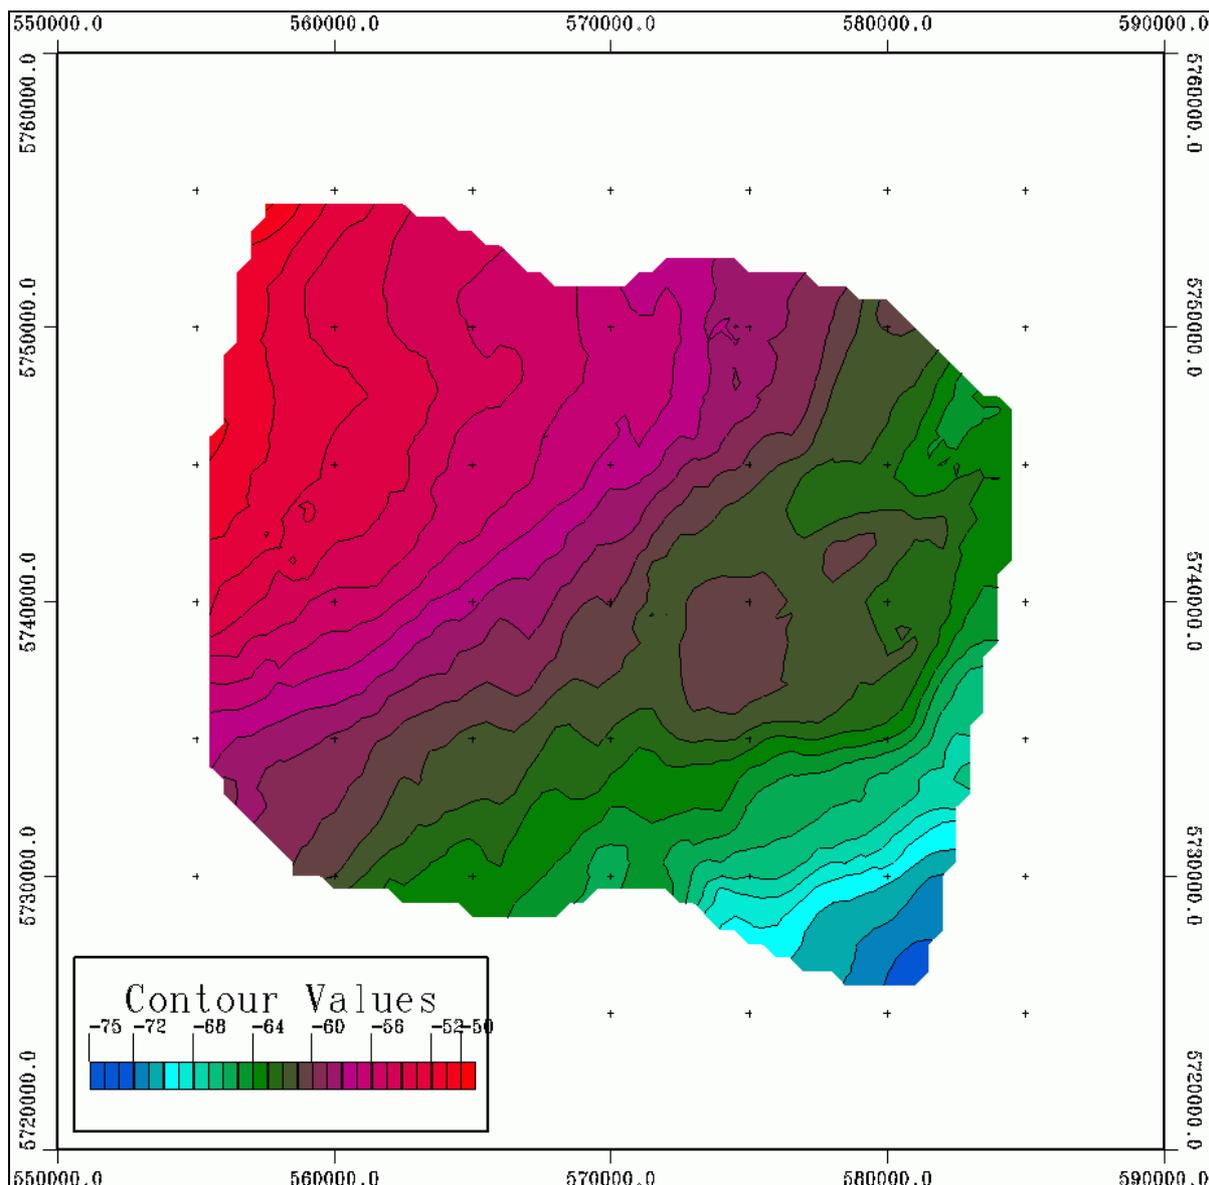

Figure 3: Bathymetry in the survey area

2.2.4 FISHING AND SHIPPING TRAFFIC

Professional fishing is an occasional activity around the prospect. Due to pre-survey planning and good communication between Esso, Veritas and the local fishermen, very few problems were encountered. The professional fishing activity increased towards the end of the survey, in-line with the established fishing seasons in the area. Whenever fishing activity was encountered, dialogue was initiated between the vessels and ensured a compromise acceptable to all parties was achieved.

During the survey, Veritas employed several chase boats to scout and patrol the area and act as a supply vessel. The main chase vessel – OMS Voyager – had a major malfunction in the early days of the survey and a replacement was found – Swissco.

Since the prospect area is well away from international shipping lanes, no commercial traffic was encountered. The occasional pleasure craft was encountered. Either the SR/V Veritas Viking II bridge personnel or the chase vessel requested they stay well clear of the operation. No incidents were experienced with shipping traffic.

2.2.5 SEISMIC INTERFERENCE & TIME-SHARING

No other seismic research was conducted near the prospect during the time of acquisition; hence, no seismic interference was present at any time.

Occasionally, low levels of noise from passing vessels were observed as well as side-swipe on undershoot and close passes to the platforms.

2.2.6 SURVEY LAYOUT

The survey was an irregular rectangular shape. The swaths with their acquisition directions are displayed in Figure 4. A post plot map of the acquisition is included in the CD-ROM and is shown in Figure 5. Table 1 shows the coordinates of the full-fold boundary in WGS-84 datum.

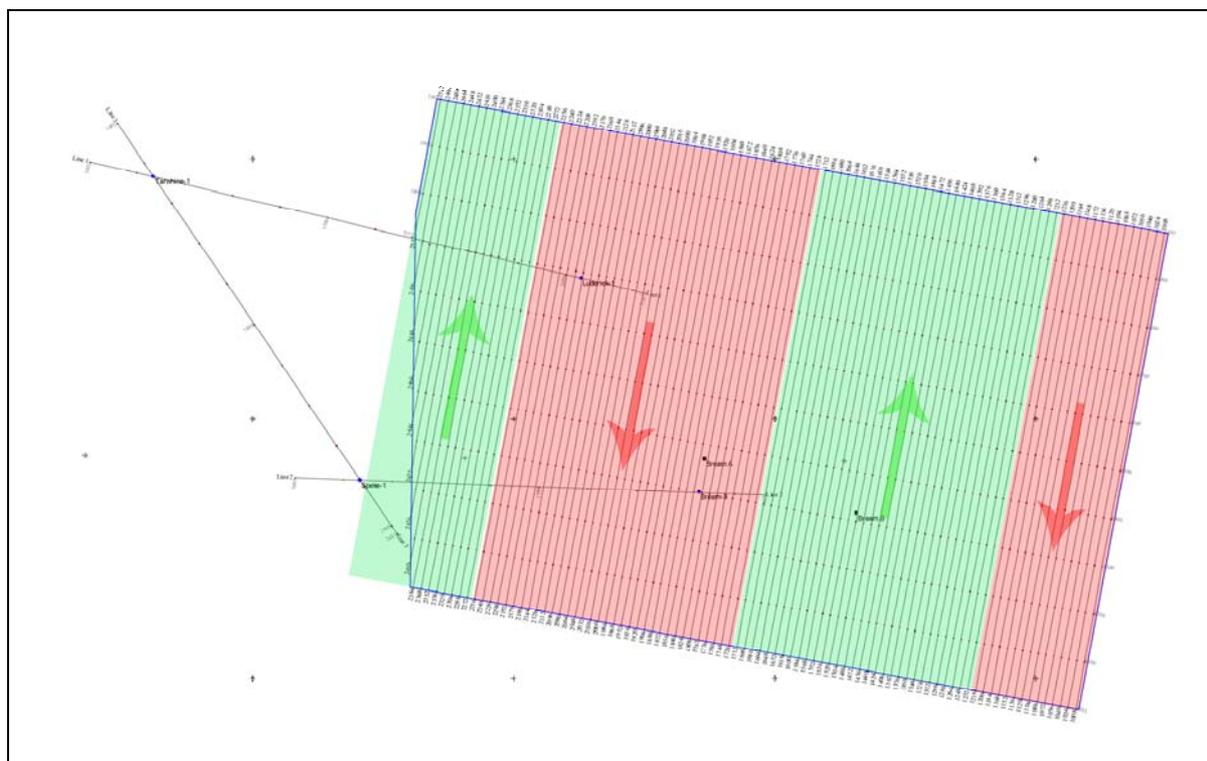

Figure 4: Greater Bream 3D survey map with acquisition swaths indicated

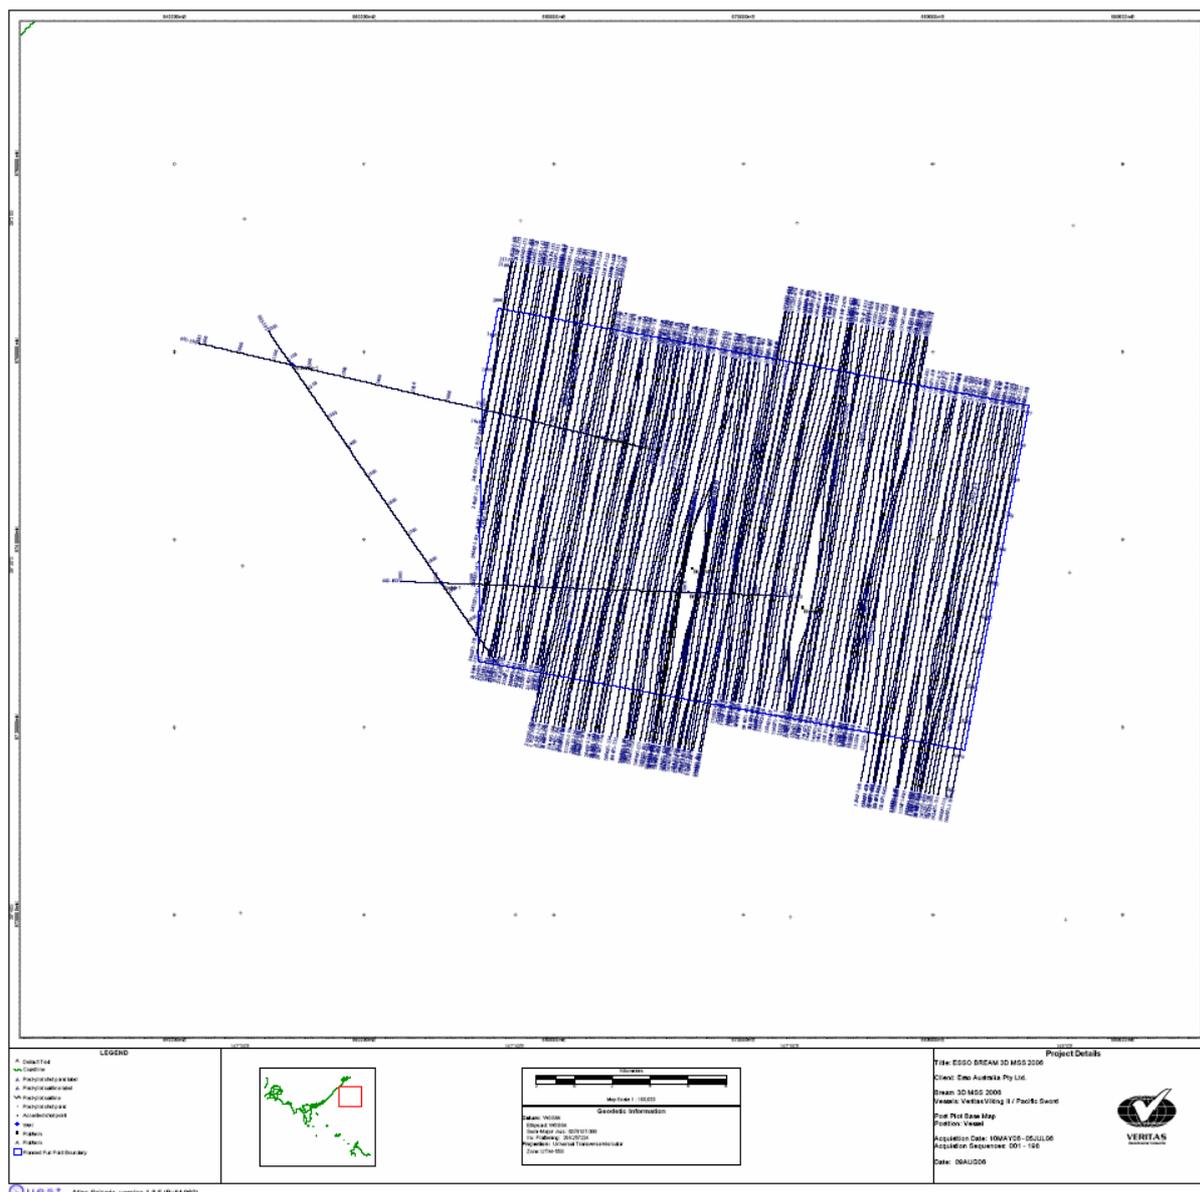

Figure 5: Greater Bream 3D survey post plot

Point	Line	SP	Latitude	Longitude	Eastings	Northings

Table 1: 3D Survey Full Fold CMP Coordinate Boundary (WGS84)

2.2.7 UNDERSHOOT

Undershoot operations were required to attain data around and underneath the Bream A and Bream B installations. To do this, the M/V Pacific Sword was mobilized from Indonesia to act as the remote source boat.

Undershooting is a technique where a remote source is steered at a lateral (and sometimes in-line) offset to the head of the streamers so that CMP coverage is pulled midway between the two vessels. Figure 6 shows this in a graphical manner. As can be seen, the location of the illumination zone can be varied by changing the distances between source and receivers; however, as the distances increase, so does the minimum offset achieved. This can impact the quality of the image under the structure, particularly in shallower water.

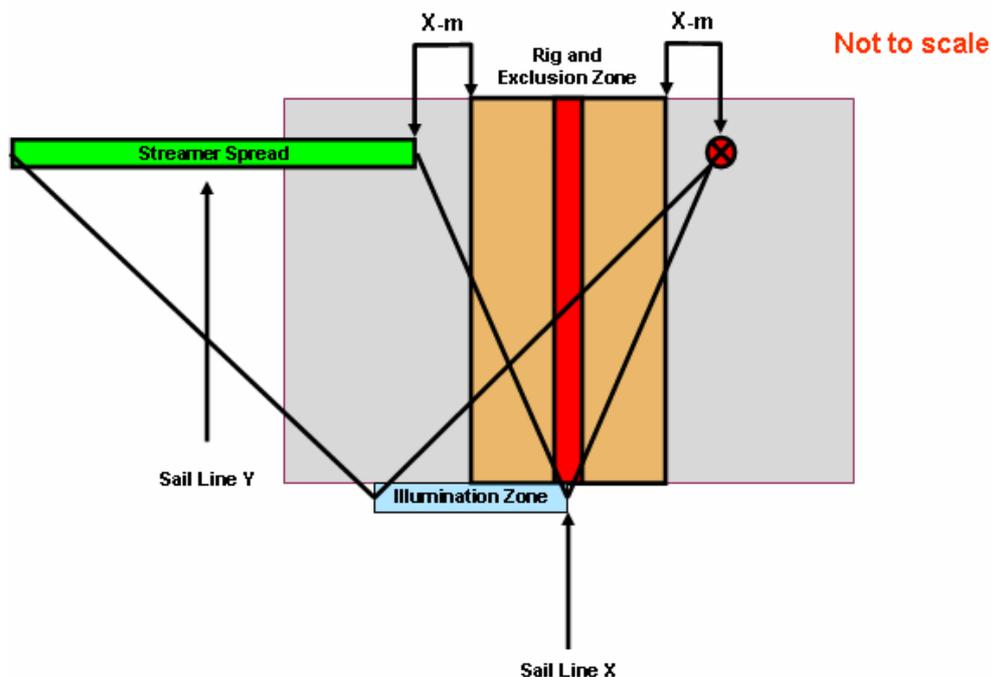

Figure 6: Cross-sectional view of a general undershoot configuration

Prior to the survey, Veritas Houston ATG performed modelling of the undershoot operation given the operational limitations of the platforms and their exclusion zones so as to ascertain the coverage that could be expected from the field. This presentation is included in the Document Archive section of the CD-ROM.

2.3 EQUIPMENT PERFORMANCE

2.3.1 NAVIGATION CALIBRATION AND DEFINITIONS

The performance of the dGPS and rGPS systems was verified in Freemantle Harbor (WA), on 21st and 22nd April 2006. The gyrocompasses were also calibrated at this time. Calibration reports can be found in the Supporting Documents section of the CD-ROM.

2.3.2 NAVIGATION DEFINITIONS

Onboard Veritas vessels, a NavDef is defined as a 'unique acquisition configuration'. The definition comprises a list of all reference points used for derivation of the network solution

and system positions. This list includes base-station locations, antenna locations, equipment locations, serial numbers and offsets, data corrections, compass biases, delays etc. At the start of the survey, the Spectra INS (integrated navigation system) is configured with all this information, and this is collectively identified as NavDef #1. All lines recorded with the same navigation definition are recorded with identical parameters. A full set of NavDef diagrams is supplied in the Supporting Documents section of the CD-ROM.

During the survey, 14 navigation definitions were used to describe the acquisition configuration for single vessel operations, and three navigation definitions were used to describe the acquisition configuration for dual vessel operations (Table 2).

NavDef	Date	First Line	Seq. #	Last Line	Seq. #
01	10-MAY-2006	G06A-1728P1	001	G06A-1728P1	001

Table 2: Line sequence listing for each NavDef used during the survey

2.3.3 NAVIGATION SYSTEMS

Concept Systems' Spectra Integrated Navigation System is used for continuous real-time intra-system monitoring, v10.9.1 was in use at the time of the survey. Time-series plots for a range of essential systems (all monitored by the Spectra software) are generated for each line and are included in the Document Archive section of the CD-ROM.

2.3.4 NAVIGATION METHOD OF APPLICATION

The GPS positioning system service employed aboard the SR/V Veritas Viking II is Veripos Ultra/Standard provided by Subsea 7. The Veripos service combines two independent GPS positioning methods – an SDGPS (Satellite Differential GPS) solution known as Veripos Ultra and a conventional dual-frequency pseudo-range correction dGPS solution known as Veripos Standard.

The Ultra solution is derived from corrections to GPS system errors as computed at a series of global reference sites. These types of errors (clock drift, ephemeris errors, orbit errors, etc.) are tabulated for each satellite. Correction information is transmitted to remote receivers for each satellite tracked in the local positioning constellation, while the conventional dGPS solution relies on pseudo-range corrections derived from a set of local reference stations.

Within the integrated navigation system, the primary system is defined by the more accurate SDGPS solution and the secondary system is derived from the conventional dGPS solution. The Veripos QC software is able to output multiple position solutions that allow for cross system verification and system performance monitoring.

A tertiary system, C-Nav, is provided as an independent verification of the primary and secondary positioning systems.

2.3.5 RELATIVE GPS SYSTEMS

The tailbuoy tracking system in use on the SR/V Veritas Viking II is the BuoyLink STORM rGPS system developed by SeaMap. In addition to the tailbuoys, all source arrays and four streamers (Streamers 2, 3, 6 and 7) have rGPS pods tying in with additional acoustic pods, giving further redundancy to the front positioning network.

The rGPS operating efficiency is documented in the Line Reports found in the Supporting Documents section of the CD-ROM.

2.3.6 ACOUSTIC RANGING SYSTEM

The SR/V Veritas Viking II uses acoustic ranging systems for the subsurface positioning of the sources and streamers. These acoustic networks provide high quality measured ranges with known inline distances acting as constant range verifications. The total system is deployed in three networks – the front-end, mid-net, and tail on the streamers and on each of the source arrays.

The front-end network is more prone to signal instability problems due to the longer ranges within the network and because some ranges have to propagate through the continuous propeller-induced water turbulence behind the vessel and disturbance created by the source arrays. The lost ranges do not significantly degrade data quality due to the redundancy built into the positioning network, including additional redundancy provided by the rGPS units located on the sources and streamer heads.

During the survey, degradation of performance is most noticeable during high side-wind and sea-states, where high vessel crab-angles generate more than usual propeller-wash directed towards one side of the streamer set-up and a single source array.

Any defective or suspect acoustic nodes are noted in the Line Reports for each sail sequence and removed from the navigation solution.

2.3.7 DIGITAL STREAMERS

The SR/V Veritas Viking II is equipped with Guardian Twinax solid streamer manufactured by Thales Underwater Systems (now Sercel). The streamers were towed at a nominal depth of 7 m, with a +/- 0.5 m variation allowed. Significant deviations from the specified streamer depths are noted on the Line Reports. In addition, all areas of the streamer outside the specified depth are removed from the binning system and coverage deficient areas are reacquired if needed. The complete list of edits is provided in industry standard ADS format files in the Document Archive section of the CD-ROM.

On some occasions, if there is a danger of streamers crossing each other, the depths of the respective streamers are changed and in-line offsets may be changed by up to 10 metres to avoid damage and streamer tangles. The client representatives are always kept informed of such occurrences and all occurrences are noted in the Line Reports and subsequently edited from the coverage.

The specifications for noise were such that the ambient noise level for an individual trace on the streamer could not be more than 5 microbars. Exceptions to this are channels located near the vessel, channels near depth controllers and other streamer devices and channels at

the far end of the streamer. Channels failing these criteria or manufacturer's specifications are noted on the Line Reports for each line and edited from the coverage.

Vane-wash – turbulence due to the movement of the paravane through the water – can affect the depth of certain sections on the outermost streamers in certain sea states (particularly during very calm sea states). As a result, fluctuating streamer depths are occasionally observed when the streamer moves through this turbulent water. The specific area affected changes with vessel crab, feather angle and weather conditions. When present, usually only the two outermost streamers are affected, at an area around 400-1000 m behind the paravane. To help combat the problem, an extra depth controller is positioned on streamers 1 and 8.

To further combat the problem the length of the vane tether rope was extended by 10 metres to move the area of turbulence caused by the vanes further from the streamers.

Occasional problems occur with streamer extraction errors and lost telemetry data. Since the location of the extraction error is not always directly identifiable, some time usually needs to be spent tracking down the location of the fault. Often, the error can be temporarily worked around by reducing the vessel speed. This way, troubleshooting and repairs can wait until favourable conditions.

2.3.8 RECORDING INSTRUMENTATION

Raw seismic data are recorded on the Sercel/Syntrak-960 24-bit seismic data acquisition system. This system incorporates 4 separate Multiple Streamer Telemetry Processors (MSTP), each capable of handling two streamers. Data are passed to the Multiple Streamer Recording System (MSRS) from where the data are routed through ProFocus' ARGUS direct-to-disk system to the 3590 tape drives. Data are subsequently passed through to the SeisNet software for online shot display and ambient noise analysis. The main advantage of disk recording over recording data directly to tape is that all tapes are filled to capacity and bad tapes are selected out at the source. If the system encounters a bad tape, the tape is rejected and the intended data is rewritten from the start to a new tape ensuring the highest possible data integrity at all times.

2.3.9 SEISMIC ENERGY SOURCE

The seismic energy for SR/V Veritas Viking II was provided by identical dual 4450 cubic inch tuned source array configurations. The undershoot vessel, M/V Pacific Sword, towed a similar single array of 4550 cubic inches. See Source Array Design under the Supporting Documents section of the CD-ROM for details of the tuning.

The arrays consisted of Bolt 1500LL and 1900LLXT type elements, with each array being made up of 3 individual sub-arrays nominally separated by 8.0 (+/-1.5) metres. The nominal array separation on the SR/V Veritas Viking II was 37.5 (+/- 3.75) metres.

Source fire-times are controlled and monitored by the Syntron GCS-90 Marine Seismic Source Controller. Occasional misfires (i.e. a shot point for which one of the elements in the array fails to engage) are noted on the observer logs. The source synchronization specification for this survey was such that each source element had to fire within +/- 1.0 ms from the aiming point. Source synchronization errors, misfires and autofires (elements firing without command) are all noted in the Line Reports and all source errors greater than 1.5 ms are edited from the coverage and in onboard processing.

Source array and sub-array separations are continuously monitored during the survey, and both generally remained within specification. Differences were caused by variations in weather and sea state, vessel crab and currents. In particular, when a trailing current hit the vessel and equipment, the separations between the two sources were temporarily affected. Source air pressure was specified as 2000 (+/-5%) psi and this was achieved for all valid shots. Any deviations are noted and subsequently edited from the survey coverage.

2.3.10 GENERAL IN-WATER CONFIGURATION

Veritas models the towing set-up before any survey starts; this simulation is referred to as a STARSIM and it was used to design the towing configuration for this survey. The model calculates the expected forces on the in-water equipment, the expected inline offsets, the total layback of the spread, the lengths of rope, the amount of streamer lead-in to be deployed etc. all based on the current physical condition of the equipment in use. The modelling greatly reduces the time spent testing and adjusting the towing configuration during the mobilisation phase, with usually only minor adjustments to be made after deployment.

Some time was spent tweaking the geometry of spread in the early days of the survey, currents in the area turned out to have a big influence on the layout. Contradictory observations were made depending on the sailing direction and the current forcing the equipment to a certain direction. Adjustments were made throughout the survey period.

A measure of the performance of the spread is the average source array and streamer separations. The average streamer separations at the front-end throughout the survey are displayed in Figure 7. Note that these separations are variable, dependent on currents and vessel crab (the angle between the line direction and the vessel heading). Note the change apparent after sequence 69 when the towing configuration was fine-tuned to improve the

streamer separations. Note also that the separations between streamers 4 and 5 were the most susceptible to variations in the vessel speed through the water due to the differing effects that the current dependent on the shooting direction.

The Trouser effect, a variable and often wider than nominal separation observed at the tail of the spread between the inner cables, was observed frequently during the survey (Figure 8). This effect can be detrimental to survey coverage as receiver positions migrate away from the regular grid resulting in coverage gaps. A significant amount of data was retrieved to attempt to isolate the cause of this effect; however, no single indicators were found. Mid to far-mid tag lines were proposed for the inner streamers, but this was deemed operationally unsafe to deploy.

Coverage was monitored throughout the survey using the 33% Rule technique defined in the contract and no additional infill was required as a result of the Trouser effect even though the problem was considered significant. Further investigations will need to be made to isolate the key factors that cause this effect so that a mitigation measure can be designed.

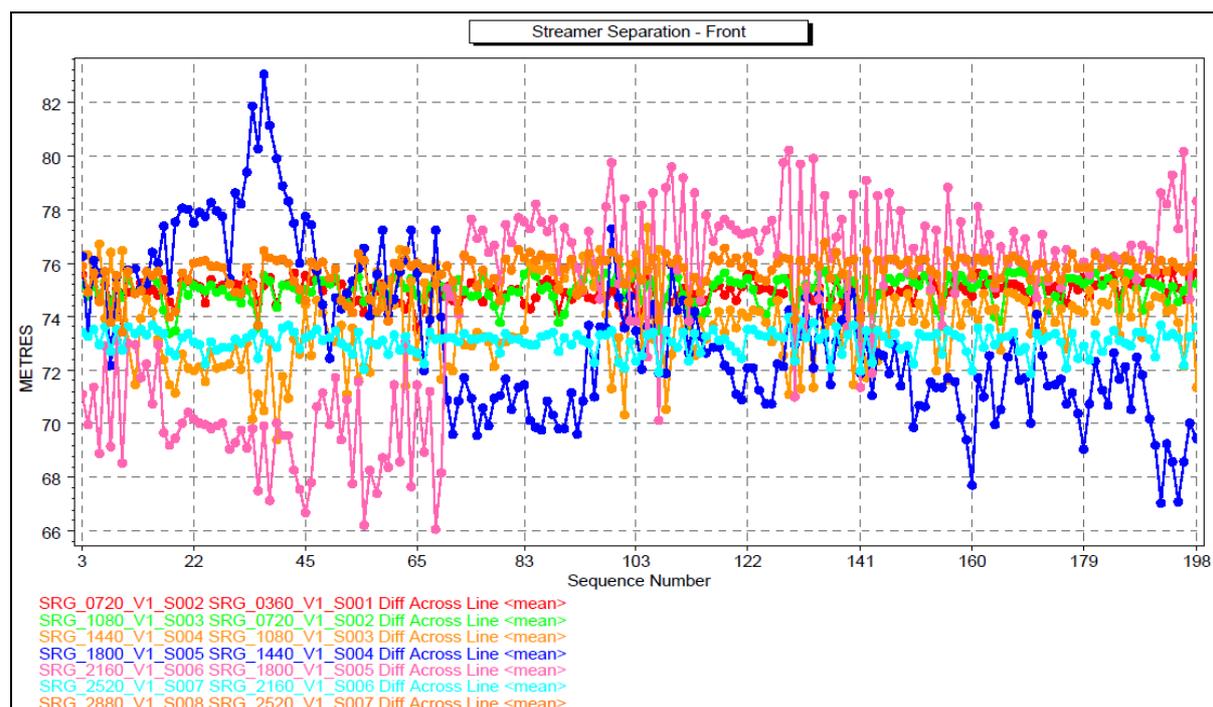

Figure 7: Average streamer separations on the near offset for each sail sequence

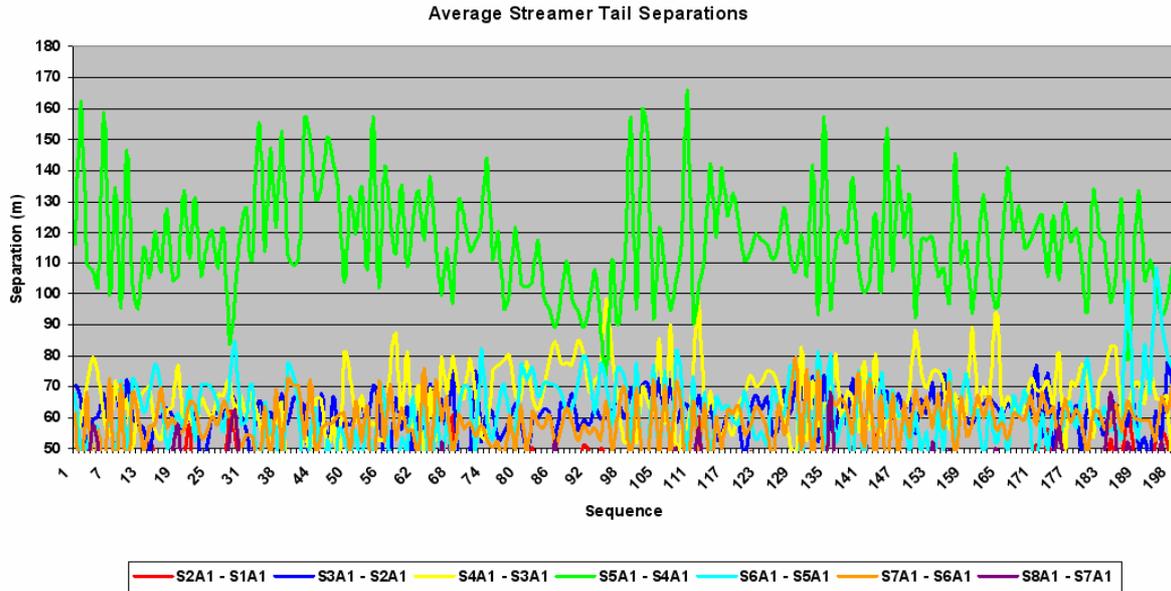

Figure 8: Average separations between the streamers at the tail of the spread (Trousing)

The source separations displayed consistent behaviour for the majority of the survey. The average source separations throughout the survey are displayed in Figure 9; the average separations between the arrays in each source are displayed in Figure 10.

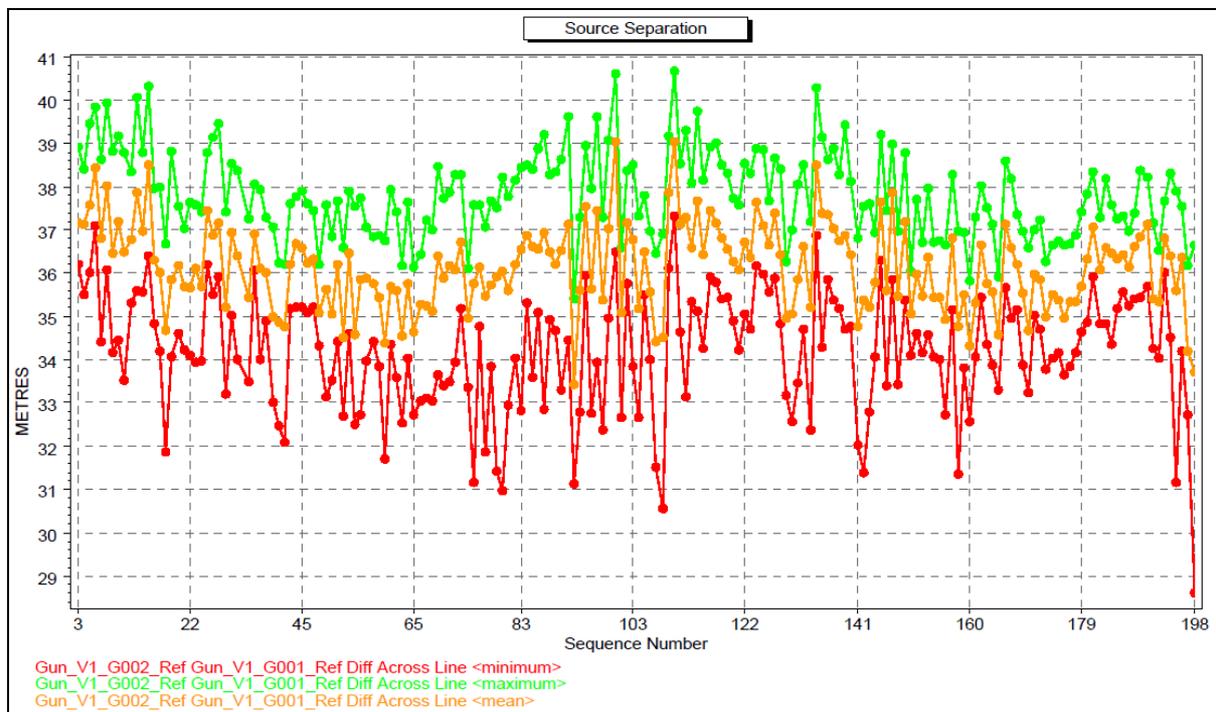

Figure 9: Average source separations per sail sequence

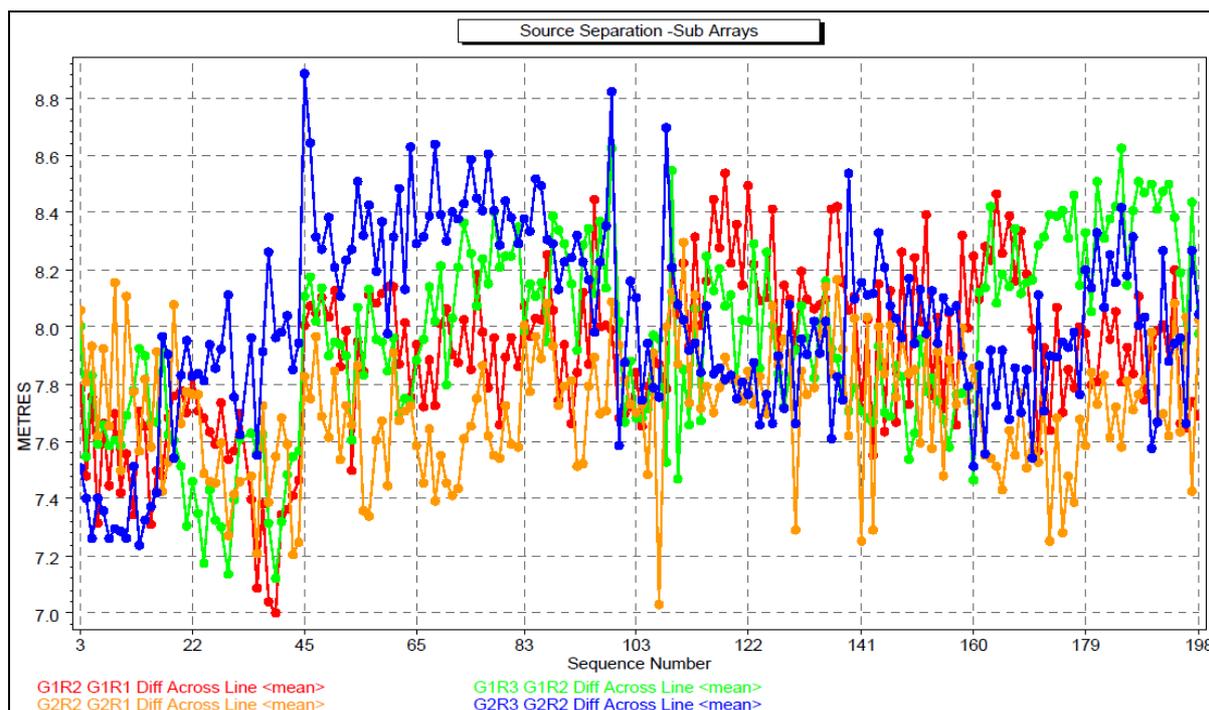

Figure 10: Average inter array source separations per sail sequence

2.3.11 SHIPS EQUIPMENT

The compressors performed well throughout the survey period with very few occasions of lower than usual pressures, with only one occasion where the air pressure dropped below specification.

The M/V Pacific Sword was delayed leaving Portland, Victoria on the 11th May due to issues with the engine exhaust system.

2.4 PRODUCTION SUMMARY

2.4.1 LINE DIRECTION AND SEAMS

The Greater Bream 3D survey consisted of 98 sail lines (incl. three 2D well-tie lines) with an average of 18.07 full-fold sail km per line. The preplot lines were separated by 300 metres; each sail-line results in 16 CMP lines (or tracks) giving a total of 1520 CMP lines spaced 18.75 metres apart. The final swaths and the preplot sail line numbers for the survey were (Figure 4):

- Swath 1: Lines 1008 – 1296 Direction 190.5°
- Swath 2: Lines 1312 – 1712 Direction 010.5°
- Swath 3: Lines 1728 – 2192 Direction 190.5°
- Swath 4: Lines 2208 – 2512 Direction 010.5°

Within the survey area, the sail lines were numbered from 1008 in the east, and incrementing by a value of 16 until 2512 in the west. Consequently, the CMP lines were numbered from 1001 to 2520.

A full listing of sail line coordinates is included in the original P1/90 format in the Document Archive section of the CD-ROM.

2.4.2 LINE COMPLETION AND NOMENCLATURE

Of the 98 pre-plot lines in the survey (incl. well-tie), 5 lines were incomplete after the first attempt at acquisition and a further 5 were DNP (Do Not Process). All line portions that were initially marked incomplete or DNP were completed during later vessel passes. Smaller duration problems, covering only a limited range of shot points (less than 8 subsequent), were edited out of the survey coverage where appropriate but not re-acquired. Line naming for the 3D lines used the following naming convention (except in the P1/90 processed navigation data):

PPPP-LLLL-TN-SSS (including hyphens), where:

PPPP: was the survey prefix (G06A).

LLLL: was the numerical sail line number.

TN: was the line type (P for Prime and F for Infill) followed by incremental attempt number, starting at 1 for each line type attempt.

SSS: was the three-digit sequence number.

Line naming of the 2D lines was similar to above with the exception that the line number was a 3 digit number (LLL) and the type and attempt number (TN) was left out.

Progressive infill lines are acquired when the pre-planned prime sail line drifts too far off the grid due to butting up to previously acquired prime lines; this is usually caused by currents in the area. A progressive infill line is inserted to bring the planned prime sail line back onto the grid. Due to mismatching feather angles, a high number (44) of progressive infill lines were required on this survey, 5 of which were on the seams where the acquisition direction changes or on the survey edges.

Infill lines are acquired in areas of insufficient coverage after completed prime lines.

Each line, whether primary or infill, was given a sequence number for identification. This includes lines that were abandoned for technical reasons.

The completed survey required 198 line sequences, including the 2D well-tie lines; 17 lines were classified as DNP (Do Not Process).

2.4.3 COVERAGE AND INFILL

The Spectra RobTrack interface permits the navigators to steer the vessel remotely from the instrument room with the visual assistance of the BDN (binning display node) for improved CMP coverage.

Steering is controlled directly by the navigators; the acquisition plan is made in conjunction with the onboard client representatives. At all stages of the survey, the client representatives are shown the coverage and asked for their guidance as to exact requirements.

For offline binning, Veritas uses Concept Systems' Reflex (v1.9.4 in use at time of the survey). The software is fully integrated with the Spectra (online) navigation software. Following each line completion, the raw navigation data are processed and imported into the offline binner. At this stage, edits for streamer depth, bad channels, bad shots and anything else outside the contract specifications are applied. The processed coverage data are then available to be used in the online navigation software.

Due to strong and variable currents in the prospect area and resulting high and variable feathering angles of the streamers, certain areas displayed low coverage.

For the Greater Bream survey, the streamer offsets were divided into 4 offset zones. Two grids were used for coverage assessment: a static grid without bin expansion to assess the as-acquired coverage, and a flexed grid, which was used to determine coverage deficient areas. In general, the vessel was steered so that full-fold coverage was achieved in zone 2 (the 'mid-near' offset zone) as per contract specification.

The zones had varying coverage requirements. Table 3 shows the offset zones that were in use during acquisition and the minimum requirements for bin fold coverage.

Description	Actual offset range	Max Fold	Zone ID	Required percentage	Min Hits
Zone 1	150-1275	15	1	90	14 (13.5)
Zone 2	1275-2400	15	2	80	12 (12.0)
Zone 3	2400-3515	15	3	70	11 (10.5)
Zone 4	3515-4650	15	4	60	9 (9.0)
All	150-4650	60	All	80	48

Table 3: Contractual fold requirement per offset and all offsets (acquisition parameters)

The flexing parameters used for the *offline* binning, used for infill allocation, are displayed in Table 4

Description	Actual offset range	Flex Near	Flex Far	Bin Size Near	Bin Size Far
Zone 1	150-1275	100 %	125 %	18.75 x 37.5 m	18.75 x 23.4375 m
Zone 2	1275-2400	125 %	150 %	18.75 x 23.4375 m	18.75 x 46.875 m
Zone 3	2400-3525	150 %	175 %	18.75 x 46.875 m	18.75 x 51.5625 m
Zone 4	3525-4650	175 %	200 %	18.75 x 51.5625 m	18.75 x 56.25 m
All	150-4650	100 %	200 %	18.75 x 37.5 m	18.75 x 56.25 m

Table 4: Bin-flex parameters and requirements for infill allocation

Infill decisions were made by the onboard client representative based on fixed and flexed coverage plots. At survey completion, 54% of primary CMP kilometre coverage had infill data acquired in order to achieve the contractual fold obligations. It should be noted that infill is expressed in terms of sail line kilometres and not the actual area of degraded coverage since it takes the same effort to fill a single CMP line hole as it does for the equivalent 16 CMP line hole.

The final percentages of bins within requirement and the average fold for all offsets per zone are displayed in Table 5. These values are inside the full-fold area and the percentage 'in spec' is defined as the percentage of bins achieving more than the required percentage for that particular offset range.

Offset Zone	Static		After bin expansion	
	Percentage in spec	Average fold	Percentage in spec	Average fold
1	95.5	14.4	98.0	14.8
2	95.1	14.4	99.2	14.9
3	94.6	14.1	99.0	14.9
4	91.9	12.8	97.8	13.8
All	94.5	56.1	97.9	59.9

Table 5: Final coverage in terms of percentage of bins with required coverage and average fold

A series of fold coverage plots of the final static and flexed coverage in high-resolution PDF format is included in the Supporting Documents section of the CD-ROM.

2.4.4 PRODUCTION RATE

Total data production for the survey is shown in Table 6. Production totals include the 2D well tie-lines charged at full 16 CMP-Kms rates.

Total	Planned	Acquired CMP km	% Relative to pre-survey planned
Prime	31974.6	33529.8	104.86%
Infill	7993.65 (25%)	18147.9 (56.76%)	227.03%
Reshoot	0	124.5	0.39%
Total	38342.52	51802.2	135.10%

Table 6: Total data production (in CMP kilometres)

The same information in terms of *full-fold square kilometres* is displayed in Table 7.

Total	Planned Sq km	Acquired FF sq km	% Relative to pre-survey planned
Prime	533.3737	564.848	105.90%
Infill	133.34 (25%)	305.426 (57.26%)	229.06%
Reshoot	0	1.6594	0.31%
Total	666.717	871.934	130.78%

Table 7: Total data production (in full fold square kilometres)

Production totals exceeded 100% primarily due to the fact that lines on the west end of the prospect were extended from the preplots end-point to bring coverage to the full-fold boundary. This was necessary due to the high angle in the project geometry on that end of the prospect (see Figure 4).

The day-to-day production is displayed in Figure 11. Maximum production was achieved on 17th June 2006 when 1675.5 CMP kilometres were acquired. Average production over the 57-day on site survey period was 908.8 CMP-kms per day.

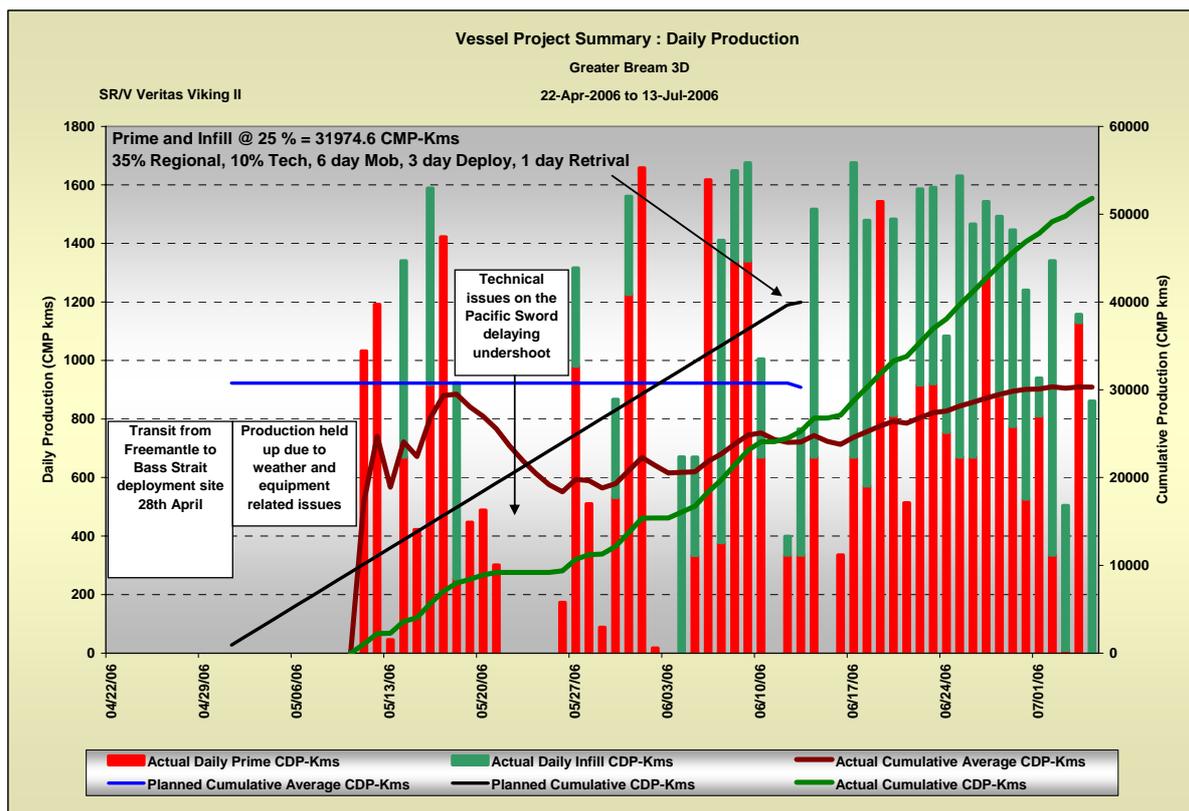

Figure 11: Daily production and survey progress in CMP kilometres

2.4.5 VESSEL SPEED

During production, the maximum speed *through the water* is set at 5.0 knots maximum while the vessel was sailing a straight line and 4.1 knots while in a turn. These limitations are due to the stresses on the trailing gear increasing exponentially with the speed through the water. In addition, more stress is induced whilst turning. However, a minimum water speed of 3.5 knots is needed in order to keep the streamers stable at the desired depths and equipment – such as streamer and source lead-ins – from sagging too much and increasing the overall drag of the trailing gear.

The vessels bottom speed whilst recording on-line is governed by the shot point interval (18.75 m), recording time (6144 ms) and the recording system overhead per shot (approx. 1.1 seconds although the manufacturer recommends at least 1.3 seconds). For this survey, this meant that the vessels *bottom speed* had to be kept below 5.1 knots in order to avoid missing shot points.

Vessel speeds during the survey are not constant; weather, sea state, currents, traffic in the area and other operational constraints dictate the vessel speed at any given time. An example of an operational constraint is a supply vessel coming alongside or fishing gear or

other detritus entangled somewhere in the spread and increasing drag and stresses on the survey equipment.

Figure 12 displays the water and bottom speed per sail sequence as well as the survey average. An average bottom speed of 4.41 knots during acquisition was achieved over the duration of the survey.

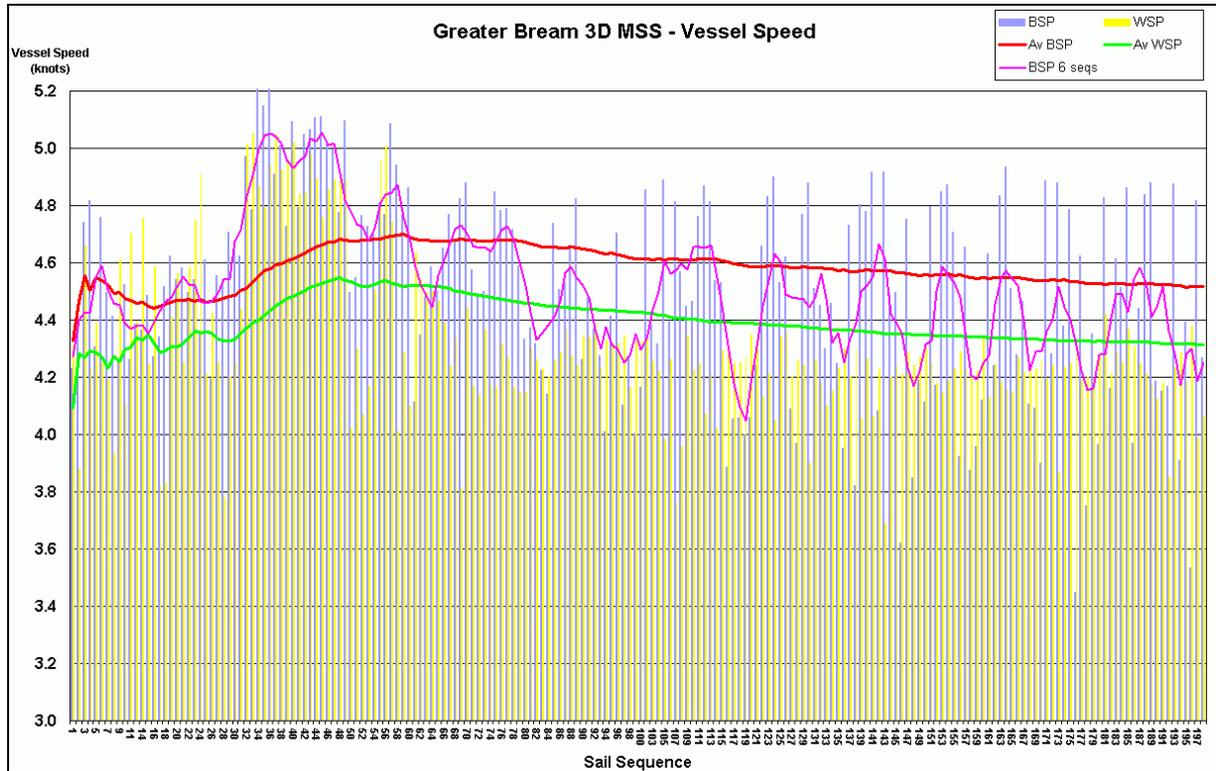

Figure 12: Vessel speed during survey

2.4.6 TIME-USE SUMMARY

Time spent on Veritas marine seismic surveys is designated according to seven primary time-usage categories (Table 8) each of which is further broken down to provide more detailed time-use.

Main Category	Description
Mob/Demob	Time spent mobilising and demobilising from the survey including the deployment and retrieval of the gear.
Service Time	Time spent in transit, testing, maintenance, logistics, reconfiguration and medical evacuation.
Recording	Time shooting and recording prime, infill, and /or undershoot coverage.
Line Change	Time spent sailing from line to line, between prime, infill and /or undershoot lines.
Technical downtime	Time repairing onboard geophysical, navigational and seismic or ships equipment, excluding routine maintenance.
Ship downtime	Time spent repairing vessel owned equipment such as compressors, generators and propulsion specific items.
Regional downtime	Downtime due to environmental conditions, obstructions, industry activity, fishing vessels, wildlife, other traffic, and other seismic activity (including time-sharing), plus time spent changing areas, scouting, and extended line changes. It includes time spent repairing equipment failure due to weather.

Table 8: Main time-use categories and description

The accounting for this survey started on 22nd April 2006 at 00:00 hours at which time the vessel was alongside in the port of Freemantle. At 08:00 22nd April 2006 the vessel departed Freemantle port for the Greater Bream 3D survey area.

Time accounting ended at 24:00 on 13th July 2006.

Figure 13 illustrates the time use for the project (cumulative and individual vessel). The elapsed time on this survey amounted to 3128.1 hours, equivalent to 130.34 vessel days² (details of time-use can be seen in Table 9). Of this total, 425.22 hours were spent recording data (prime, infill and undershoot) and 489.75 hours were spent line changing. This does not include *extended* line changes, which are accounted for in the Regional Downtime category. Collectively, time spent recording and line changing equates to 29.3% the total time spent on the survey. The remaining 70.7% is described as follows:

² Total timing is expressed here in terms of vessel days as each vessel generates 24 hours of time per day while on contract. Total survey duration is actually 1992 hours or 83 days.

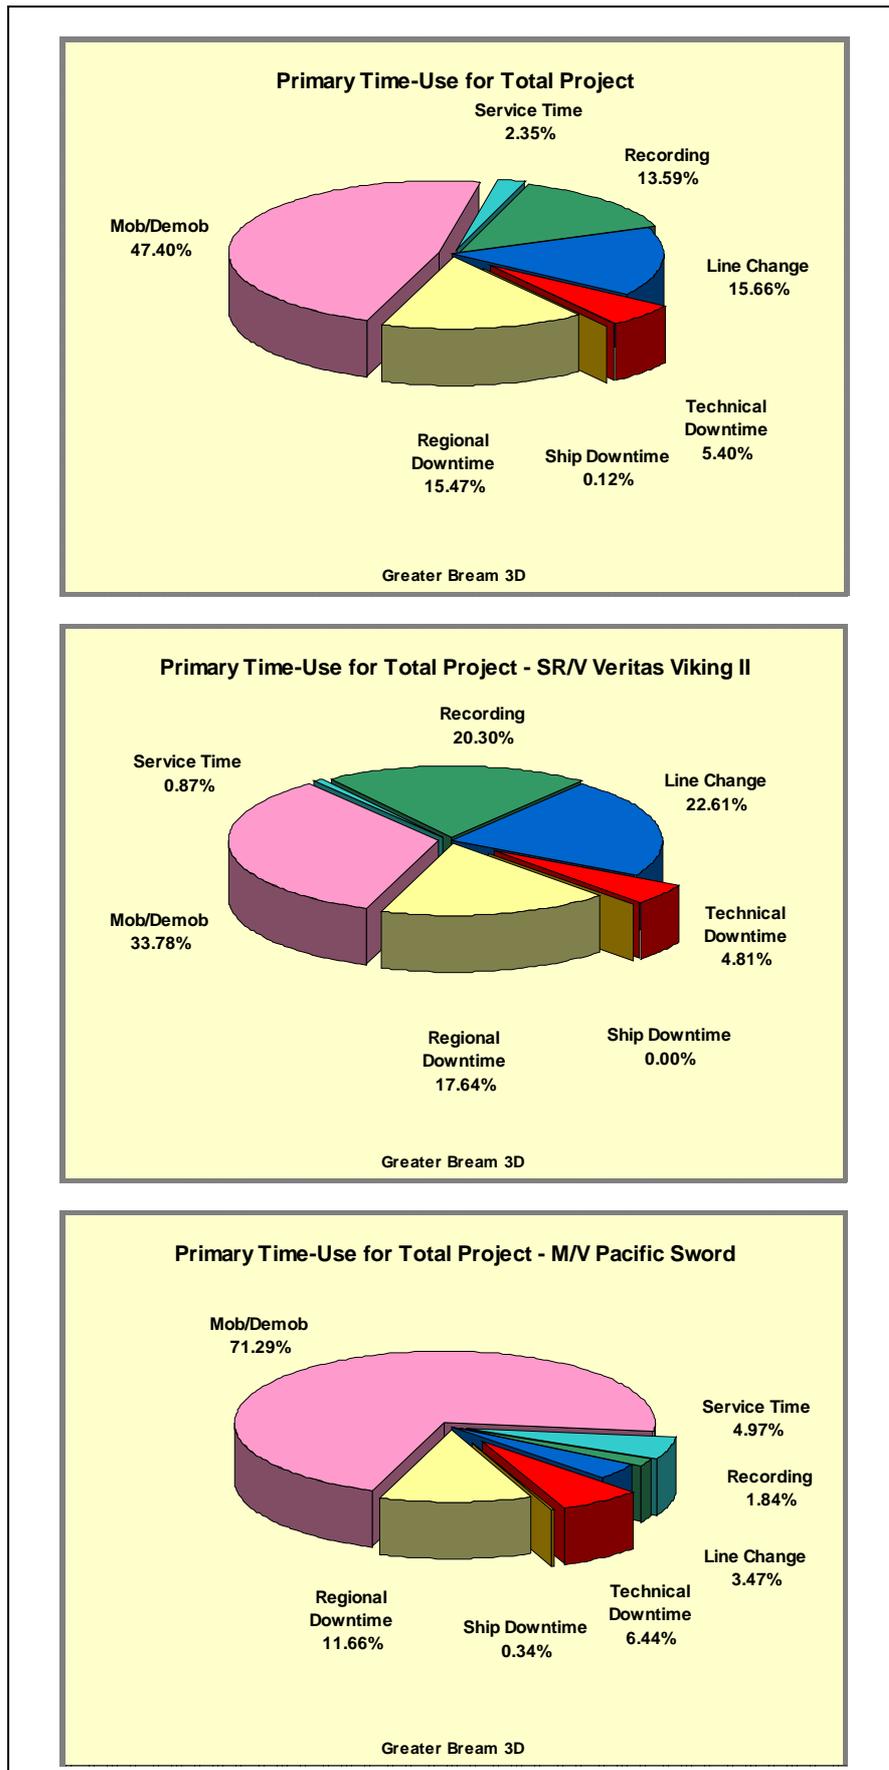

Figure 13: Time-use according to category

MOBILISATION/DEMobilISATION TIME 1482.8 HRS (47.4%)

Mobilisation time for the SR/V Veritas Viking II includes the travel time (159 hours) from the port of Freemantle to the Greater Bream 3D prospect, and all time for the deployment of the trailing gear upon up to the first accepted line on 11th May.

Mobilisation time for the M/V Pacific Sword included travel time from Singapore to Portland, Victoria and further travel time to the project ending on the 12th May.

Demobilisation time for the SR/V Veritas Viking II covers the time from the last shot point, the recovery of the trailing gear (23 hours), and transit (171 hours) to the port of Fremantle (incl. the time in port) until midnight on July 13th.

Demobilisation time for the M/V Pacific Sword included a short retrieval of the guns on the 30th May, customs clearance out of Australia and then travel time to Indonesia eventually concluding on the 11th June.

SERVICE DOWNTIME 73.65 HOURS (2.35%)

Approx. 12.8 hours was accrued for extended line changes in order to facilitate re-supply operations and 7.7 hours for extended line changes to allow safe helicopter landings. A further 53.2 hours were accrued by the M/V Pacific Sword while waiting for the SR/V Veritas Viking II to complete the delineation of the platforms prior to starting the undershoot.

TECHNICAL DOWNTIME 172.7 HOURS (5.5%)

A total of 95.7 hours technical downtime was incurred during the project for the SR/V Veritas Viking II and the remaining 77 hours were allocated to the M/V Pacific Sword³.

By far, the largest source of technical downtime was related to the source array on the M/V Pacific Sword. A total of 66.2 hours was allocated for failed guns and airlines. Additionally, sequences 32 and 33 were flagged as DNP due to poor sub-array separations and accounted for 18.1 hours.

24.3 hours were accrued by the SR/V Veritas Viking II, through a combination of out of spec source arrays, the loss of a source float and an air-leak.

There were 22 hours of handling related downtime onboard the SR/V Veritas Viking II, with 20 hours spent increasing the tether rope lengths to the vanes to combat the outer streamer depth instabilities caused by vane-wash. The remaining time was associated with a hydraulic

³ It should be noted that both vessels logged Technical downtime simultaneously even though errors typically only occurred on one vessel for any given instance.

problem on streamer reel 5, and an extended line change to allow the workboat to return to the vessel before sunset.

There were 26.7 hours of technical downtime for navigational issues attributable to the M/V Pacific Sword for a loss of rGPS data to the centre sub-array.

There were 11.5 hours on the SR/V Veritas Viking II related to navigation systems, with 7.9 hours caused by DigiCOURSE Multiplex Unit lockups and a further 3.6 hours lost to acoustic problems.

3.7 hours were charged to compressors on the SR/V Veritas Viking II when a portion of sequence 5 had to be reacquired due to low air-pressure.

SHIP DOWNTIME 3.83 HOURS (0.12%)

The M/V Pacific Sword was delayed leaving Portland, Victoria on the 11th May due to issues with the engine exhaust system.

REGIONAL DOWNTIME 483.9 HOURS (15.47%)

The biggest contributor in this category was weather standby time with 465.2 hours lost when the vessels were unable to acquire data in adverse sea conditions, and a further 5 hours was added when Extended Line Changes were required due to the sea conditions.

Extended line change time due to survey layout, and obstructions (the Barracuda platform) contributed 3.4 hours.

Fishing vessel activity required 5.6 hours of Extended Line Change in avoidance measures. A total of 15 hours was incurred during the two vessel undershoot operation, 9.5 hours in maintaining the tidal cycle, and 5 hours when it was necessary to break off a close pass of Bream B due to an excessive feather angle.

A cetacean sighting on July 1st accounted for 3.5 hours of regional downtime on the SR/V Veritas Viking II and an additional 1.3 hours was observed on the M/V Pacific Sword when she had to standby the technical for poor visibility related to the marine mammal observation measures.

TIME-USE CATEGORIES	TOTAL HOURS	VIKING II HOURS	SWORD HOURS	TOTAL DAYS	% OF PROJECT	% OF SURVEY	% OF PROD
Mob/Demob	1482.83	672.90	809.93	61.78	47.40%	0.00%	0.00%

Table 9: Time-use analysis

2.4.7 LINE CHANGE ANALYSIS

In order to optimise acquisition and minimise time spent on line changes, Veritas uses Engenius Software's SurvOpt. The software suggests optimum paths through the remaining lines and gives accurate timing estimates based on current survey parameters.

Planning prior to the survey – using a bottom speed of 4.1 knots in turns and 4.5 knots on straights, 6750 m run-in and 3200 m turn radius – in order to determine the optimum acquisition path resulted in an expected line change time average of 2:44 hours. The total time to complete the survey was expected to be 34 days and 18 hours from first to last shot

point, including 60% downtime due to technical issues (10%), some weather (25%) and infill acquisition (25%).

The line change time after each sequence is displayed in Figure 14. At survey completion, the average line change time for all regular (i.e. prime data) line changes (the maximum for this statistic was set to 3.5 hours to filter out periods of downtime and other anomalously long line changes) over the survey period was 2 hours 37 minutes. The initial completion estimate turned out to be 61% accurate due to the higher than anticipated infill requirement caused by a requirement to steer all zones whilst encountering feather angle mismatches caused by a shooting pattern that did not match the tidal cycle. The total time between first and last shot point was 56 days 13 hours.

Contractually, line change times were set at a nominal value of 2:45 hours. Any time spent on a line change in excess of this value is charged as Regional downtime (weather, sea state or currents). Total line change time for prime lines (not including undershoot) at survey completion amounted to 250 hours for 98 lines, an average of 2:33, well within the nominal line change time. During the survey, the vessel speed was decreased from the planned speed to 4.2 knots to minimise front-end noise.

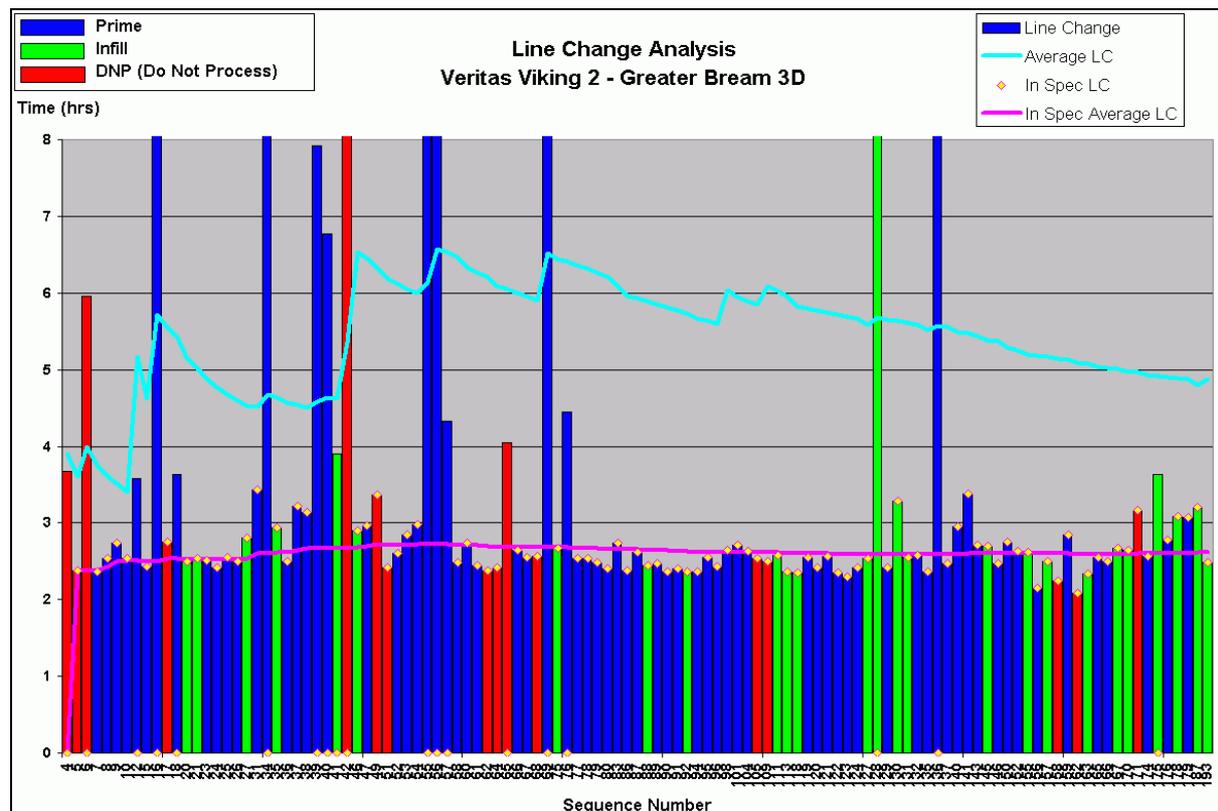

Figure 14: Line-change time per sail sequence

An illustration of the line change paths used during the survey is displayed in Figure 15.

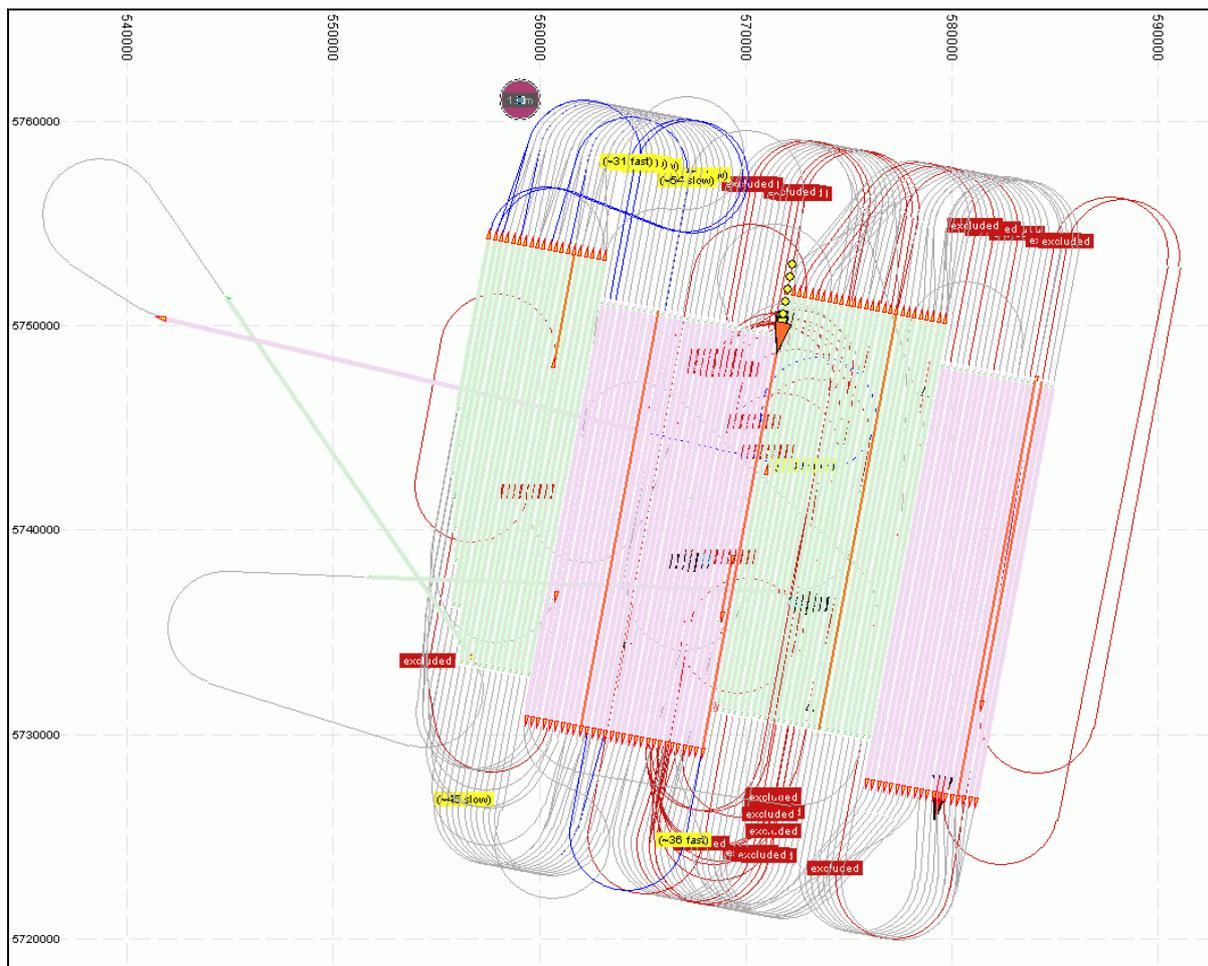

Figure 15: An indication of the line change paths during the survey

2.5 HEALTH, SAFETY AND ENVIRONMENTAL

2.5.1 EXPOSURE HOURS

During the Greater Bream 3D MSS, from 22nd April to 13th July 2006, 155184 exposure hours were incurred, given that 24 hours exposure was attributed to each person onboard the main, support and undershoot vessel for one day. The undershoot vessel – Pacific Sword – is included from 25th April to 11th June 2006.

Vessel	Veritas	Contractor	3 rd Party	Client	Total
Veritas Viking II	56376	37032	18072	7320	118800
Pacific Sword	19008	16128	1248	0	36384
Combined	75384	53160	19320	7320	155184

Table 10: Exposure hours

2.5.2 SAFETY ACTION POINTS

The vessel maintains an Action Point register of items to improve safety onboard. As a result of independent, self- and cross-audits, hazard reporting by crewmembers performed before and during the survey period and general suggestions or issues, 4 safety Action Points were created during this survey; 3 Action Points were closed. At the end of the survey, 1 Action Point remained open.

The Pacific Sword created 7 Action Points during the course of the survey, 4 were closed and 3 remained open at the end.

2.5.3 SAFETY EVENTS

The number of audits, drills etc are listed in Table 11.

Category	Event	Frequency (Pac Sword)	Frequency (Viking 2)
Audits / Inspections	Cross Audit	6	18
	Management Audit	0	0
	Inspection / Department Audit	14	18
	3rd Party Audit (arranged by Client or Veritas)	0	1
	VIMS System Audit	0	0
Drills	Abandon Ship Drill	4	6
	Fire Drill	2	6
	Man Overboard Drill	0	2
	Oil Recovery Drill	0	3
Meetings	Toolbox Meetings	112	933
	Safety Meeting	2	5
	Committee Meeting	4	6
Transportation	Boat-to-Boat Transfers	19	2
	Helicopter Landings	0	22
	Port Calls	2	1
	Small Boat Launch	0	31
Environmental	Environmental Concerns	0	0
	Oil Spills	0	0
Other Events	Safety Induction Briefings	8	32
	Stepback	0	4
	Incident Investigations	6	1
	Job Safety Analysis	0	9

Table 11: Safety events

To continuously improve the safety onboard, Veritas has several programs in place that work on different levels, for instance:

StepBack – a simple yet effective concept that encourages individuals to, physically if needed, ‘take a step back’ and think about the task they are about to undertake and possible consequences of their actions.

Toolbox Meetings – a meeting for everyone involved in a task held immediately prior to the task. During the meetings, the task is outlined, hazards identified and mitigated, and when a consensus is reached that the task can be performed safely, with clear and defined roles for each person involved, the task is performed.

Awareness Improvement (AIM) – an individual performing a task is observed by another individual who then gives feedback on how the working individual handled the task. Ideally, this should be a combination of positive and negative comments. The idea is to emphasize safe actions already done by the individual and at the same time make both the observing and observed persons aware of alternatives for making the task safer.

2.5.4 INCIDENT REPORTING

All Hazard and Incidents are recorded in the Veritas Integrity Management System (VIMS). For this survey, the types and party involved in incident reporting are listed in Table 12 (Veritas Viking II) and Table 13 (Pacific Sword).

Type	Veritas	Contractor	3rd Party	Client	Total
Injury—Fatality	0	0	0	0	0
Injury--Lost Time	0	0	0	0	0
Injury--Restricted Work	0	0	0	0	0
Injury--Medical Treatment	0	0	0	0	0
Injury--First Aid	3	1	0	0	4
Environmental	0	0	0	0	0
Hazard	89	0	0	0	89
Near Miss	4	0	0	0	4
Not Work Related	6	0	0	0	6
Occupational Illness	0	0	0	0	0
Equipment Loss/Damage	2	0	0	0	2

Table 12: Incident Reporting for the Veritas Viking II

Type	Veritas	Contractor	3rd Party	Client	Total
Injury—Fatality	0	0	0	0	0
Injury--Lost Time	0	0	0	0	0

Equipment Loss/Damage	1	0	0	0	1

Table 13: Incident Reporting for the Pacific Sword

2.5.5 INCIDENT STATISTICS

SR/V Veritas Viking II long-term incident statistics at the end of the survey (as of 13th July 2006) are listed in Table 14 (Viking 2) and Table 14 (Pacific Sword).

Date of last LTI	12-JAN-01	LTIR at 200K (YTD)	0	TRCF at 200K (YTD)	0.727
Days since last LTI	2007	LTIR at 1000K (YTD)	0	TRCF at 1000K (YTD)	3.633
Man days since last LTI	116768	LTIR at 200K (95 - YTD)	0.115	TRCF at 200K (95 - YTD)	1.038
Man hours since last LTI	2802432	LTIR at 1000K (95 - YTD)	0.577	TRCF at 1000K (95 - YTD)	5.189

Table 14: SR/V Veritas Viking II long-term incident statistics

Date of last LTI	12-MAR-05	LTIR at 200K (YTD)	0	TRCF at 200K (YTD)	5.615
Days since last LTI	456	LTIR at 1000K (YTD)	0	TRCF at 1000K (YTD)	28.077
Man days since last LTI	1484	LTIR at 200K (95 - YTD)	1.97	TRCF at 200K (95 - YTD)	8.372
Man hours since last LTI	35616	LTIR at 1000K (95 - YTD)	9.85	TRCF at 1000K (95 - YTD)	41.861

Table 15: M/V Pacific Sword long-term incident statistics

2.5.6 MARINE MAMMAL ISSUES

In response to concerns regarding the potential impact of geophysical operations on marine mammals, Veritas DGC follows the seismic survey mitigation measures as set out by the Australian Environmental Agency in an attempt to minimize any effects on marine mammals. These procedures were instituted on arrival in Australian waters in January 2004, and have been implemented since that date. The procedure that is followed is:

- A visual check for marine mammal activity is maintained by a trained crewmember for at least 90 minutes before firing any source, for 20 minutes during a 'soft-start', and 10 minutes in every hour for the duration that they were firing. This includes data acquisition and source testing.
- When bringing the source array online, the soft-start method is used. The 'soft-start' method is a process whereby the seismic energy array is brought online progressively over a twenty-minute period, starting with the smallest volume sources and bringing the individual elements online one at a time until the whole array is cycling.
- During periods of darkness, night vision scopes are used to scout marine mammals.
- During line changes or extended periods where the full-array is not being fired, a single source is fired every 90 seconds to help warn off marine mammals. The 10-minute per hour watch remains in effect during this time.

Logs are kept of observer effort, mammal sightings and source use. In addition, a dedicated marine mammal observer was on the vessel for the duration of the survey.

2.6 HYDROGRAPHICAL DATA

Salinity and temperature profiles are gathered using an AML STD-12 Plus CTD probe, serial #719, capable of 50m depths. The SmartTalk AML Total System software is used to download the data; the Chen & Millero method is then used to calculate the speed of sound through the water.

Data and location information are included in the Supporting Documents section of the CD-ROM. Data from the Temperature and Salinity (TS) Dips are used to verify the water speed as continuously measured while recording data. A TS Dip was required once a week, however, this was not always possible due to inclement weather conditions. Eight TS Dip measurements were taken during the survey. An overview of the various measurements is displayed in Figure 16; note the general trend of a steady gradual increase in temperature

(and corresponding increase in velocity) through the survey period, punctuated by drops in temperature noticeable in dips conducted shortly after cyclone activity.

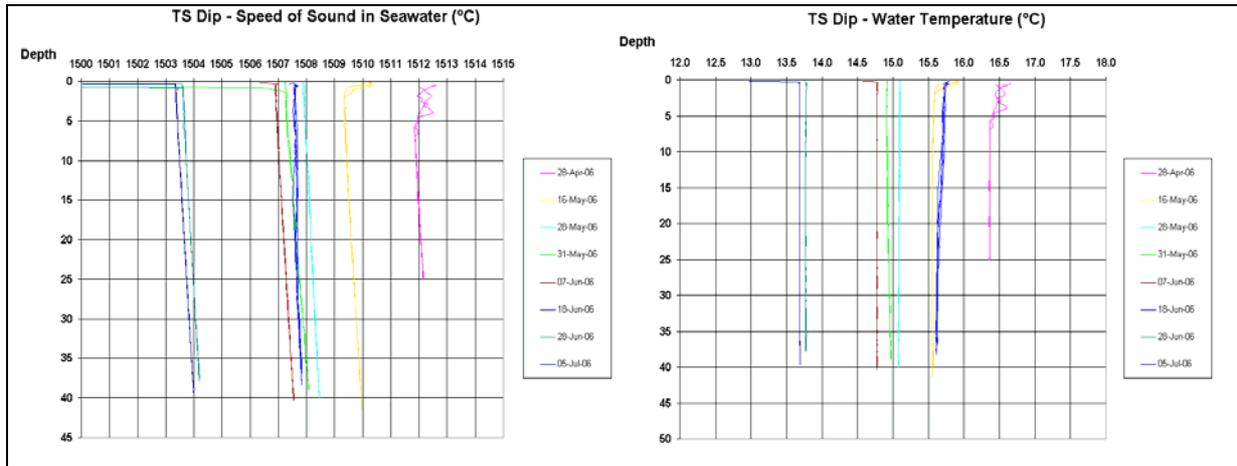

Figure 16: Results of near-surface TS measurements

3 ACQUISITION QUALITY CONTROL

The quality of the acquired seismic and navigation data are continuously monitored, during acquisition ('online') and afterwards ('offline'). Online, the observers visually monitor each shot for irregularities in addition to RMS noise levels. Meanwhile, the navigators continuously steer the vessel for maximum coverage and monitor the performance of all navigational aids. Onboard data processing and the navigation analyst perform the offline quality control.

3.1 ONLINE QUALITY CONTROL OF SEISMIC DATA

3.1.1 ONLINE MONITORING

For online acquisition monitoring and Quality Control, Veritas DGC uses Software Sciences SeisNet™ suite of software. The SeisNet software runs on two conventional PCs running Windows 2000 Professional with 18" dual-screen colour monitors. Additionally, ProFocus' Argus software running on Silicon Graphics hardware is used to capture the raw data coming off the recording instrument before outputting it to 3590 data cartridges ensuring high quality data recording. Bad tapes are rejected; data are recorded to known good tapes.

The online display continuously displays recorded data from two streamers (it cycles through all streamers and all channels) and an RMS noise value for each channel. All shots are displayed without a frequency filter and no scaling is applied. An example screen is displayed in Figure 17.

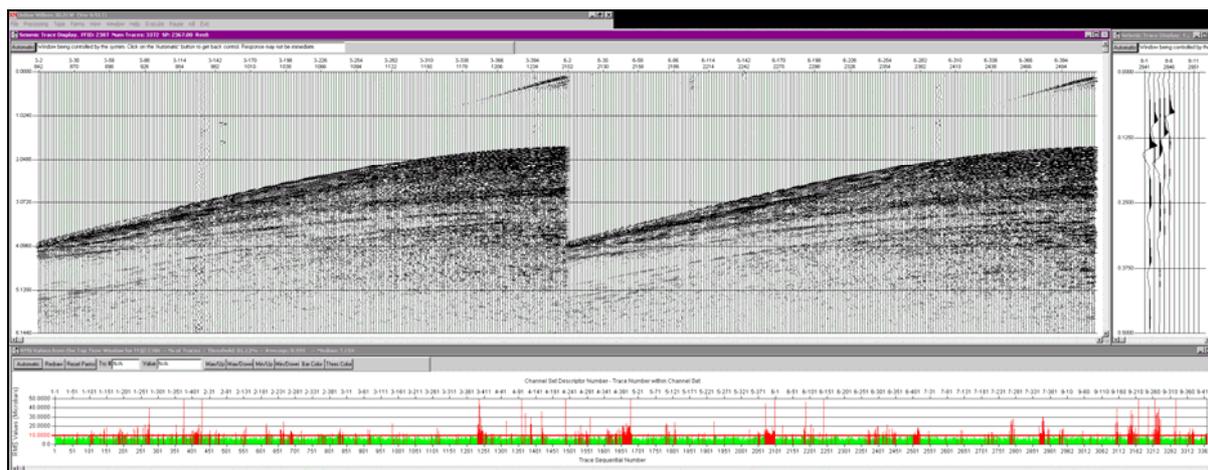

Figure 17: Online monitoring example

3.1.2 ONLINE NOISE ANALYSIS

The monitoring process during the acquisition of a seismic line included the calculation and graphical display of the ambient noise (RMS). The displays updated in real time as the line progressed and showed a channel-by-channel average noise overview - used to monitor for bad or noisy channels and to ensure that the response of each recorded channel is within 3 dB of the adjacent channel. Additionally, a shot-by-shot overview of the signal strength was calculated. Signal RMS values were calculated in a horizontal window across each shot record, a constant window from 2 to 4 seconds was chosen for this.

The ambient noise levels were calculated over a window from 5500 to 6000 ms for each shot. Finally, a signal to noise level calculated from these two values was displayed. The input to these calculations was unfiltered although the contractual noise specifications are based on applying a 5 Hz low cut filter. A sample display is shown in Figure 18.

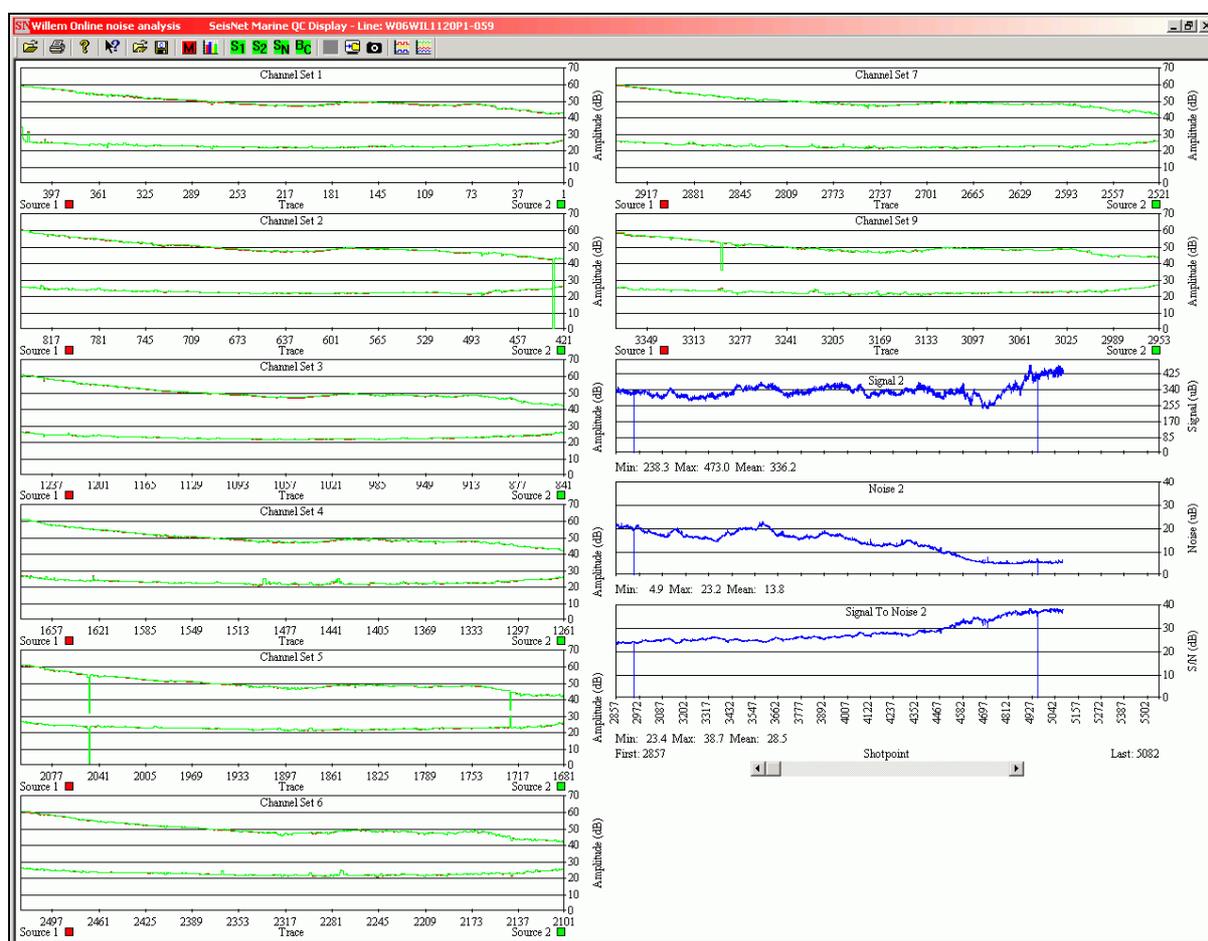

Figure 18: Online noise monitoring example

3.2 ONLINE QUALITY CONTROL OF NAVIGATION DATA

A record of the raw navigation data is kept in the QC Node reports, which are generated for each line and saved in PDF format. They can be found in Supporting Documents section of the CD-ROM.

The QC Node reports contain a plethora of graphs displaying GPS statistics, gyro compass comparisons, source and streamer separations, range and bearing to the tailbuoys and source arrays, feather angles, acoustic ranges etc. In addition, the QC Node reports contain all source and streamer depths, feather angles, velocity measurements, vessel speed, streamer tensions, compressor pressures etc. All these data and graphs are also available in real time throughout the line acquisition.

3.3 OFFLINE QC AND PROCESSING OF NAVIGATION DATA

In order to assure the integrity of the positioning of 3D surveys as near to real-time as possible, navigation processing is performed onboard the vessel. Veritas uses the industry-standard, interactive Sprint™ (version 3.1.20 in use during the survey) processing suite of software. The onboard version of Sprint runs on an HP C360 workstation. An X Window user interface is used to operate the software and the OpenIngres Intelligent DBMS database system used for data management.

Raw navigation data in UKOOA P2/94 format were transferred from the real-time navigation system (Spectra) at the completion of each line. The processing of each line was conducted during the subsequent line change and acquisition of the next line, so that the processed navigation data was delivered within 12 hours of line completion. Generally, final positioning data was available on request prior to the start of the adjacent line.

A general description of the process flow for navigation processing is described here. Quality control products are generated at each stage and enclosed in the Document Archive section of the CD-ROM.

3.3.1 IMPORT

Raw observation data were imported from the raw P2/94 file into the processing database, across the local network. Data Integrity checks were conducted on import and missing or suspect data were reported during this process and the input data quality was assessed.

3.3.2 PRE-PROCESSING

Prior to batch processing, interactive pre-processing was carried out to evaluate and, where necessary, edit the raw data. Visual review of raw and filtered displays were used to determine the amount and type of processing needed for each type of observation group. It was also during this review that the determination was made whether an observation should be disabled in the network calculation. This was typically done for loss of data or high variations associated with signal interference. The processes applied to each observation fall under three categories, that of **gating**, **filtering**, and **interpolating**. Overlay displays of raw and filtered data were used to test the effects of different gating and filter settings for each line prior to the processing of all observation data.

If sufficient noise was observed in a particular observation group, a gating pass was applied to reject data that were outside the anticipated range of acceptable values. This was typically calculated using a moving block or window of data, usually between 7 and 15 points. The median was calculated over the block, spikes rejected, and the block moved forward one point as the process was repeated.

After spikes in the data were flagged and rejected, a filter was applied to the observation. A Fourier Transform – or frequency domain – filter was applied over different time intervals. The amount of time over which the filter was applied was dependent on the noise level of the observations. Less filtering was applied to dGPS data due to the lower noise level of the data coming from the receivers.

Typical settings of gate thresholds, filter lengths, and interpolation lengths are shown in Table 16.

The same methodology was used for each group of different observation types. Filter lengths and gating parameters were adjusted to suit each type to optimise the amount of raw observations used without over-filtering or removing valid data samples.

Observation Type	Gating threshold	Filter length	Interpolation
DGPS latitude/longitude pairs	None	25 s	50 s
RGPS range/bearing pairs	5.0 m running median	75 s	100 s
Acoustic cross-ranges	0.1 m running median	50 s	100 s
Acoustic in-line ranges	2.0 m running median	25 s	150 s
Compasses along each streamer	2.0 deg running median	125 s	150 s

Table 16: Typical Filter lengths, gating thresholds and interpolation ranges

Once an acceptable set of pre-processing parameters was determined, they were saved and used to batch process subsequent data. Since the raw data were always maintained in the database, changes were easily made to adapt to the changing condition of the data on a line-by-line basis.

3.3.3 COMPASS CALIBRATION REPORT

At this stage, the Compass Calibration Report was produced. It is important that this was carried out prior to the Network Adjust process, as the compass data are essential for initial calculation of streamer shape, and as part of the SD calculation for derived observations. The Polynomial Fit method was used with auto QC values set for maximum bias of 0.85 (1.2 if within 200m of front or tail of streamer), maximum SD of 0.7 and maximum DSD of 0.07

3.3.4 DGPS PROCESSING

The dGPS data were analysed as a rate of change (1st derivative) value to graphically represent each receiver's noise level and movement. This analysis is the best means of determining if a receiver should be disabled for a particular period. All dGPS data were viewed in this fashion before it is used in the network for front-end position calculation.

3.3.5 NETWORK ADJUSTMENT

The pre-processed observations were run through a least-squares network adjustment program providing the analyst with statistical views of the solution. In order for the network statistics to be meaningful, the expected variance of each observation (*a priori*) was modified from the raw P2/94 settings. Integrated navigation systems tend to set variance tolerances much higher due to the risk of losing observations while acquiring survey information. Table 17 lists the SD settings used for the various observations groups in the processing database.

Observation Description	Assigned variance (SD)	Units
dGPS latitude/longitude pairs	1.80	Metres
dGPS Ultra lat/long pairs	0.5	Metres
rGPS range (front & tailbuoys)	1.5	Metres
rGPS bearing(front buoys)	0.217	Degrees
rGPS bearing(tail buoys)	0.0185	Degrees
rGPS bearing(sources)	0.265	Metres
Acoustics cross-line ranges	0.6 (1-way)	Metres
Acoustic in-line ranges	0.4 (1-way)	Metres
Acoustics (hull and source rangers)	0.9 (1-way)	Metres
Compass sensors along each streamer	0.40	Degrees
Gyro	0.30	Degrees

Table 17: Sample SD settings used in navigation processing

The Network Adjustment process can be followed interactively on screen; it is illustrated in Figure 19.

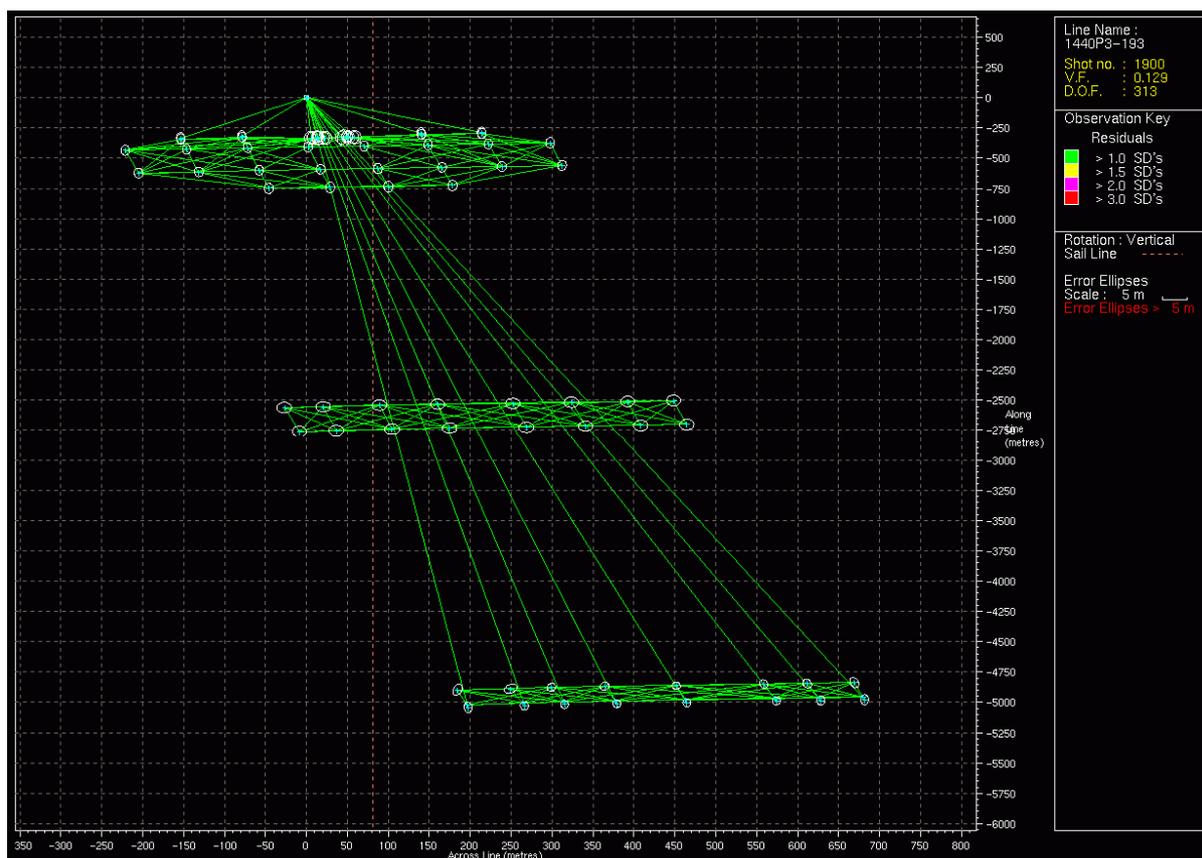

Figure 19: Network Adjust process screen display

3.3.6 ANALYSE

Interactive, graphics-based quality analyses of both the raw and processed data sets were carried out to evaluate the effects of the processing applied. Raw and processed data were overlaid on the same plots for ease of comparison. Time series graphs of selected data items and audit trail summary reports were generated for each line to verify the data quality and to document all processing steps that have been applied to the data file.

3.3.7 SURVEY WIDE ANALYSIS TOOL (SWAT)

The SWAT application was used for monitoring of statistics on a survey wide basis. It enables early detection of anomalies through comparison of new with preceding sequences. The SWAT module enables generation of time series plots for the whole survey, which could then be used for data quality control. It draws its data from a database of statistics for each line. The statistics are exported to the SWAT database on a line-by-line basis, using ANALYSE configuration files as templates. Examples of these graphs were displayed in Figure 20 (Network Unit Variance, high values tend to correspond with lines acquired with higher than average movement of the streamers), Figure 21 (Degrees of Freedom and Figure 22 (Streamer rotations).

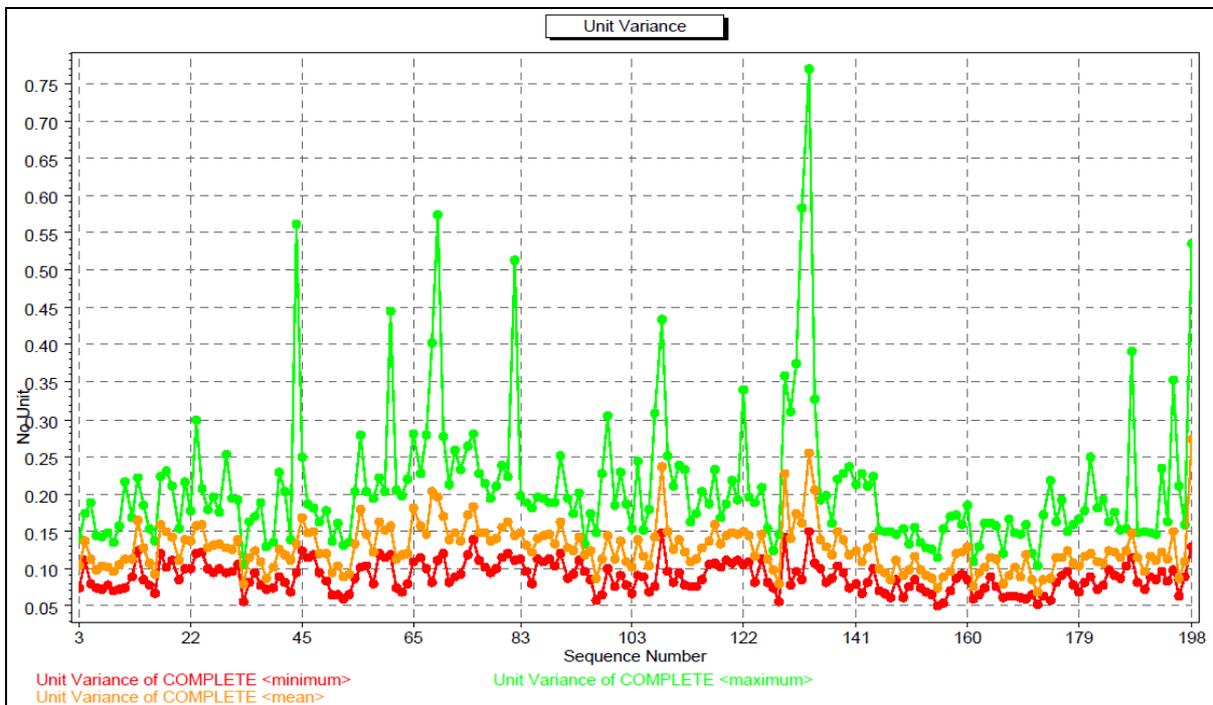

Figure 20: Network unit variance

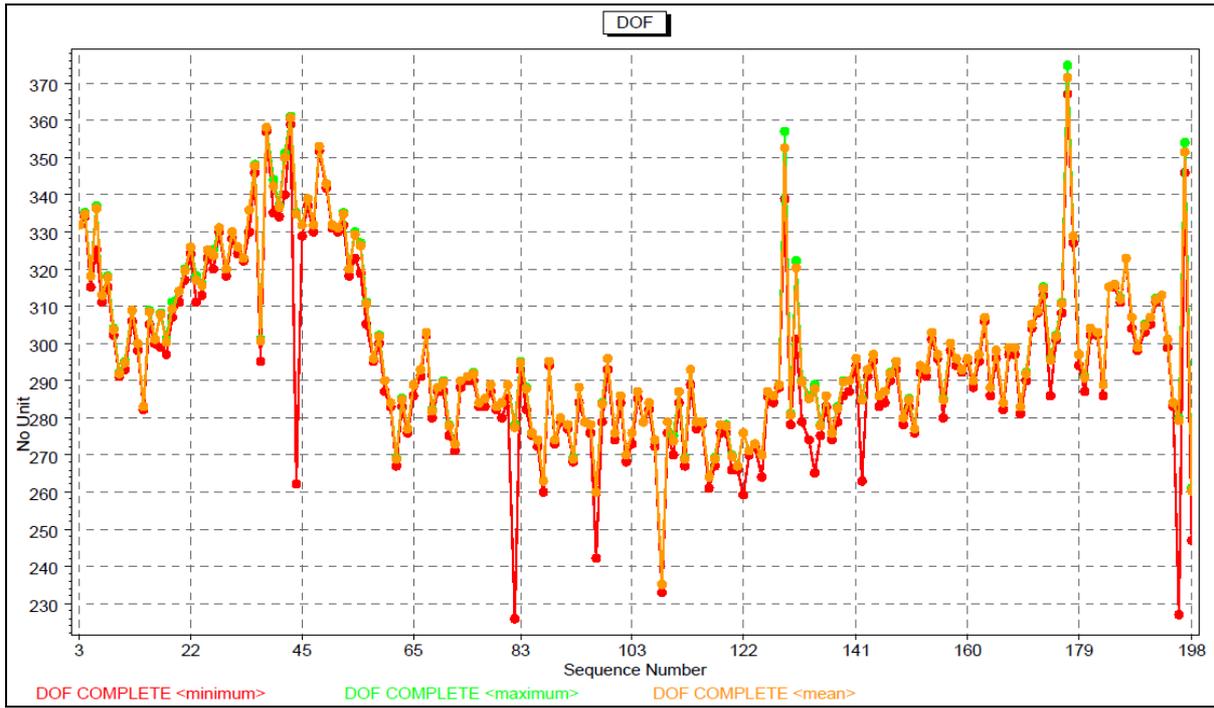

Figure 21: Degrees of Freedom

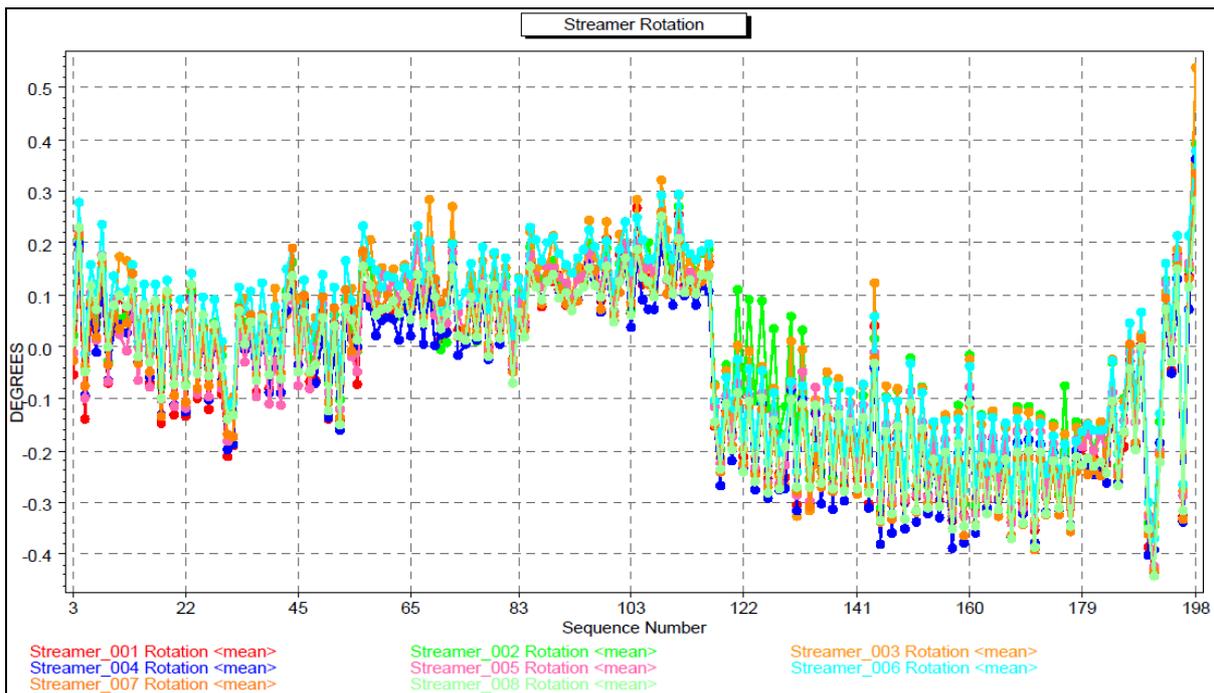

Figure 22: Streamer rotations

Note the change in streamer rotations between sequences 116 and 117, this is when the vessel moved from acquiring phase 2 lines in the east of the survey, to acquiring phase 3 lines in the west of the survey. This same trend can be seen in the infill acquisition phase of sequences 184-198.

3.4 OFFLINE QUALITY CONTROL OF SEISMIC DATA

3.4.1 ONBOARD PROCESSING INTRODUCTION

The seismic data processing onboard the SR/V Veritas Viking II uses the Veritas DGC in-house developed SeismicTANGO and Vega software. The onboard processing machines are connected to the vessel production network and to offices onshore via satellite data link. The software packages used onboard are identical to the software used in Veritas' onshore processing centres around the world.

For this survey, the standard suite of quality control data processing services was produced as well as some extra products. The main goals for the onboard processing for this survey were to provide:

- Near real time quality assurance of acquired data
- Extensive noise analyses and quality control products for each line
- A 2D brute-stacked seismic section for each line available onshore in CGM format.
- A near trace dataset for all streamers, in SEG Y format, available onshore via satellite transmission on completion of each line.
- A near trace cube on the acquisition geometry for navigation quality control
- An initial velocity field, on a 1km x 1km grid.
- Selected Raw Shot gathers in SEG Y format available onshore via satellite transmission on completion each line.

In addition to the above, a full 3D quality control stack was generated onboard.

Full-screen images of the following QC products for all sequences/stages are included in the Document Archive section of the CD-ROM.

3.4.2 HARDWARE OVERVIEW

The onboard processing system comprises four Appro 4U Quad Opteron MP (Linux) servers (each 4x2.6 Ghz Opteron CPU/16GB RAM) with 2.9 TB of available disk space each and a NAS (Network Attached Storage) with 1.5 TB RAID for data shipments (the disks are changed when filled, sent to the onshore processing centre and replaced with a different set).

Two HP N4000 workstations (each 8x550 MHz CPU/16 GB RAM) are in use for data input/output and one HP C360 workstation is in use as a plot server.

Peripheral devices attached to the HP N4000 workstations include 2 x RAID disk arrays totalling 6.3 TB of available disk space, 6 x 3590 tape drives, 2 x Exabyte drives, 2 x DAT drives, 2 x DVD drives, an Oyo 24" thermal plotter, networked laser printers and CD/DVD writers. The N-class workstations, RAID arrays, Linux clusters and NAS are connected over an optical fibre Gigabit network.

The system is networked to three conventional PCs running Windows 2000 Professional with 21" dual-screen monitors.

3.4.3 QUALITY CONTROL AND PROCESSING FLOW

The flowchart in Figure 23 outlines the onboard quality control and processing flow. Subsequent paragraphs describe the items in the flow.

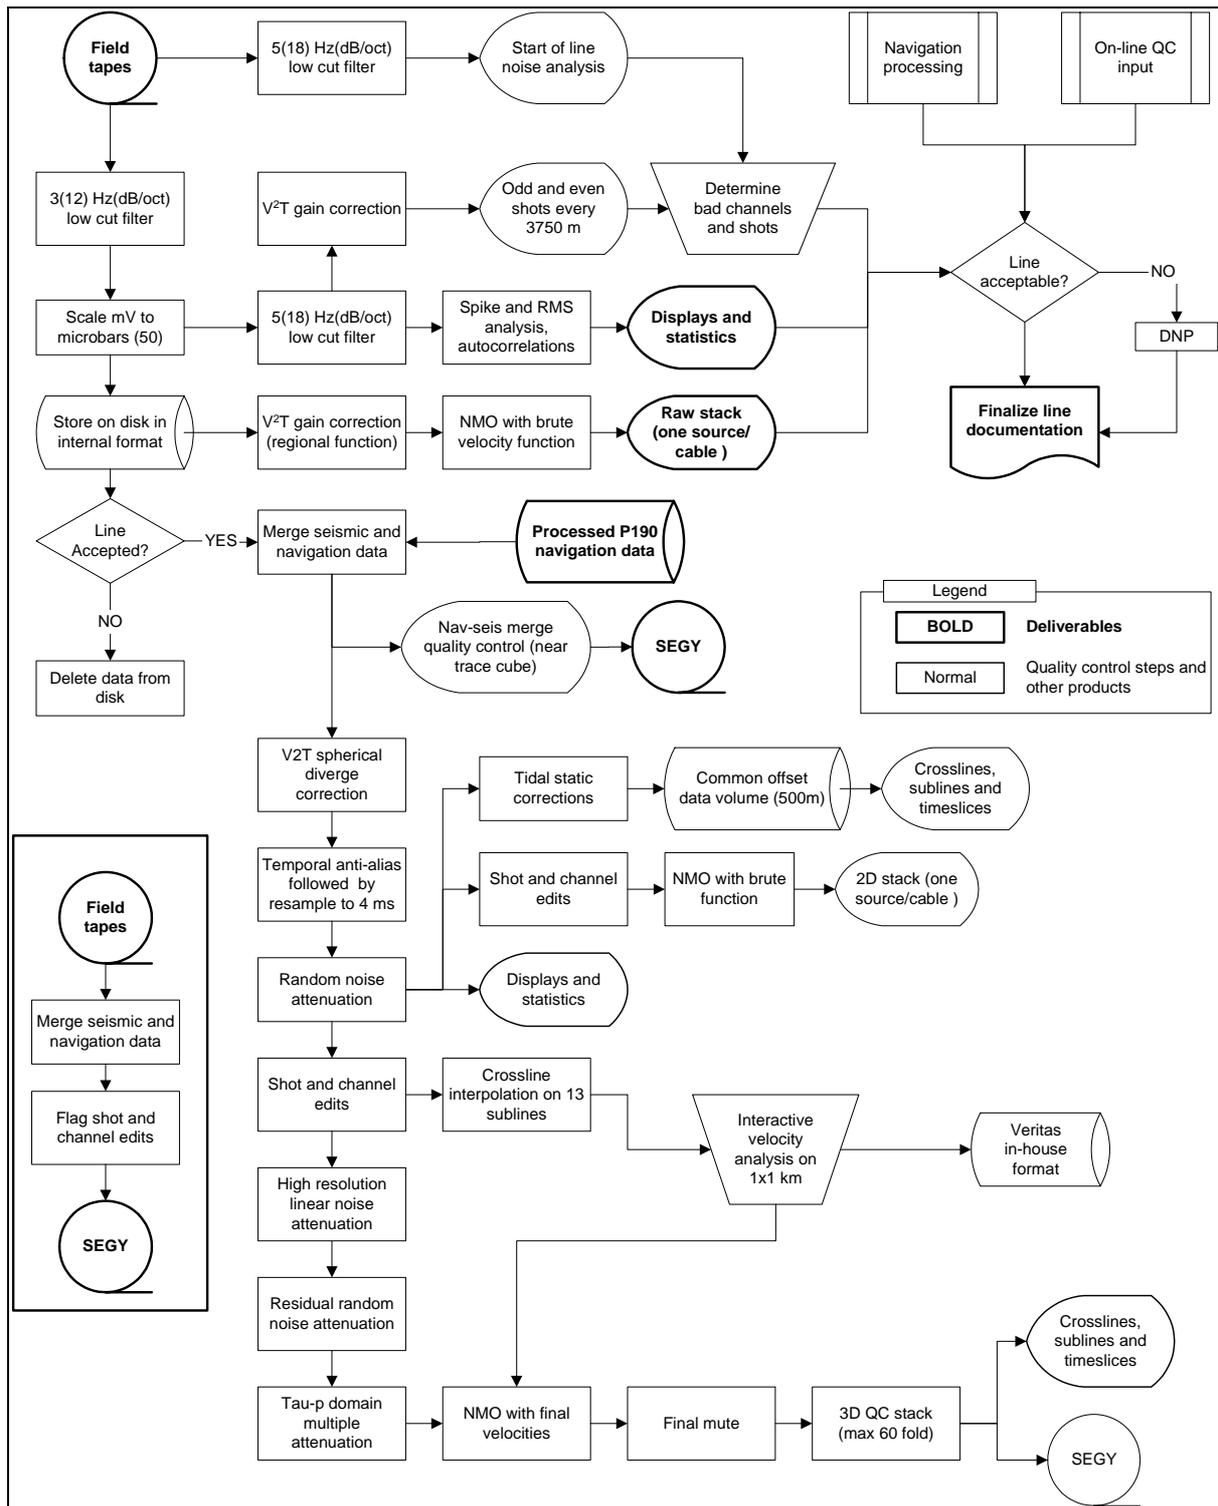

Figure 23: Greater Bream 3D MSS quality control and data processing flow

3.4.4 VERIFICATION OF RECORDED DATA

On the Veritas Viking II, raw seismic data are recorded to disk using the Argus system. Two copies were then made to tape. For each line, tapes from both sets were read by a 3590 drive different from the recording drive in order to ensure the integrity of the recording. Data read from the tapes were stored on local disk and input into the 3D production processing flow.

3.4.5 START OF LINE NOISE (SOL) ANALYSIS

For every acquired line, 12 noise files are recorded (no source firing) prior to the first production shot point. These records are analysed as soon as possible and give a good indication of the expected noise levels on the following line although they are usually taken some time before the actual start of the line on the run-in to the line. Figure 24 is an example of a SOL noise analysis graph for just one streamer. Note the visible peaks at regular intervals, these coincide with streamer depth controllers and are contractually allowed to have a higher noise value.

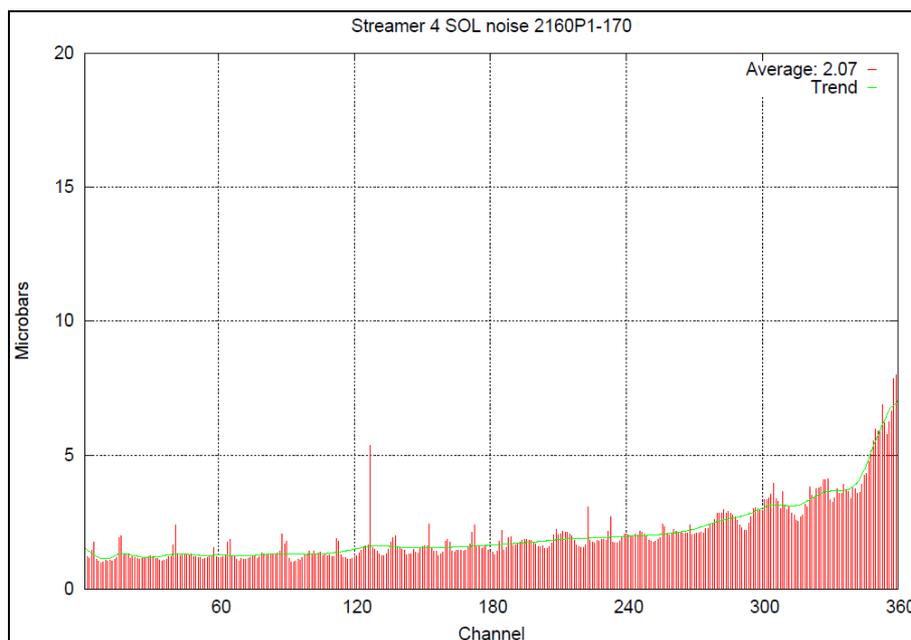

Figure 24: Example SOL noise analysis for streamer 4, line G06A-2160P1-170

Average values for each streamer are collected throughout the survey in order to track, for instance, marine growth on the streamers and ensure that the acquisition is performed within the noise specifications as set out in the contract. In all cases, data are processed through a 5(18) Hz (dB/oct) low cut filter.

Note that the SOL noise data is only valid at the start of a line. The noise data could have been recorded near a rig or vessel resulting in anomalously high and false values for the ambient noise levels on a line.

3.4.6 OFFLINE NOISE ANALYSIS

In addition to the online noise monitoring using the SeisNet system and Start-Of-Line noise analysis, similar analyses are performed after line completion using data from all shots on the line. Average RMS calculations and auto-correlations are performed over several different windows on each recorded shot (these windows are displayed on a shot-record in Figure 25). The resulting statistics are then displayed in various graphs and included in the accompanying digital archive.

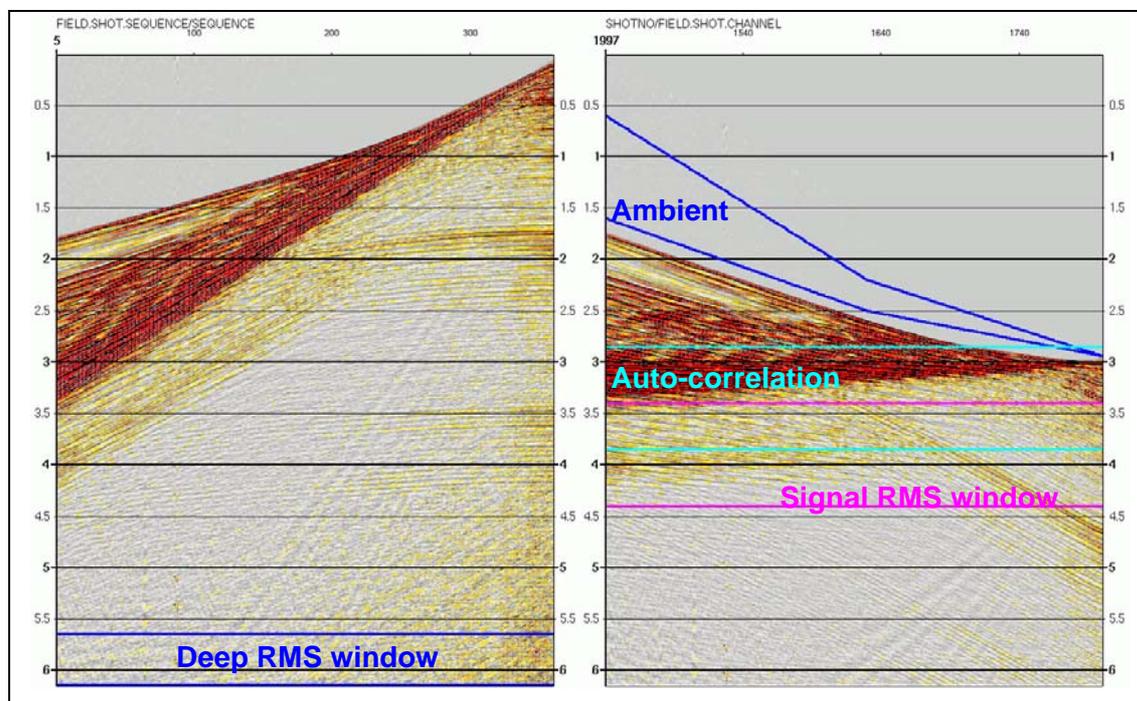

Figure 25: RMS measurement windows displayed on raw shot and after LMO correction

All input data for these analyses have been filtered through a 5(18) Hz (dB/oct) low cut filter in order to be able to directly link the values to the maximum allowable noise specifications as outlined in the contract.

An example for a single streamer is displayed in Figure 26. Also indicated in the graph is the lowest RMS value flagged for a particular channel, this helps tracking fundamentally noisier areas on lines acquired in marginal conditions. Another statistic is displayed in Figure 27, the standard deviation in noise levels per channel helps to flag channels, which are consistently noisier than their adjacent channels, the majority of the spikes fall on locations which have devices attached (depth controllers and acoustic pods).

The data for these analyses is very dependent on the location in the survey. For deeper areas in the prospect, the ambient noise window contains energy for the multiple reflections from the previous shot and this will skew the ambient noise statistics.

Figure 28 displays the (smoothed) ambient noise values per channel, per streamer in order to verify that the noise characteristics are similar for all streamers.

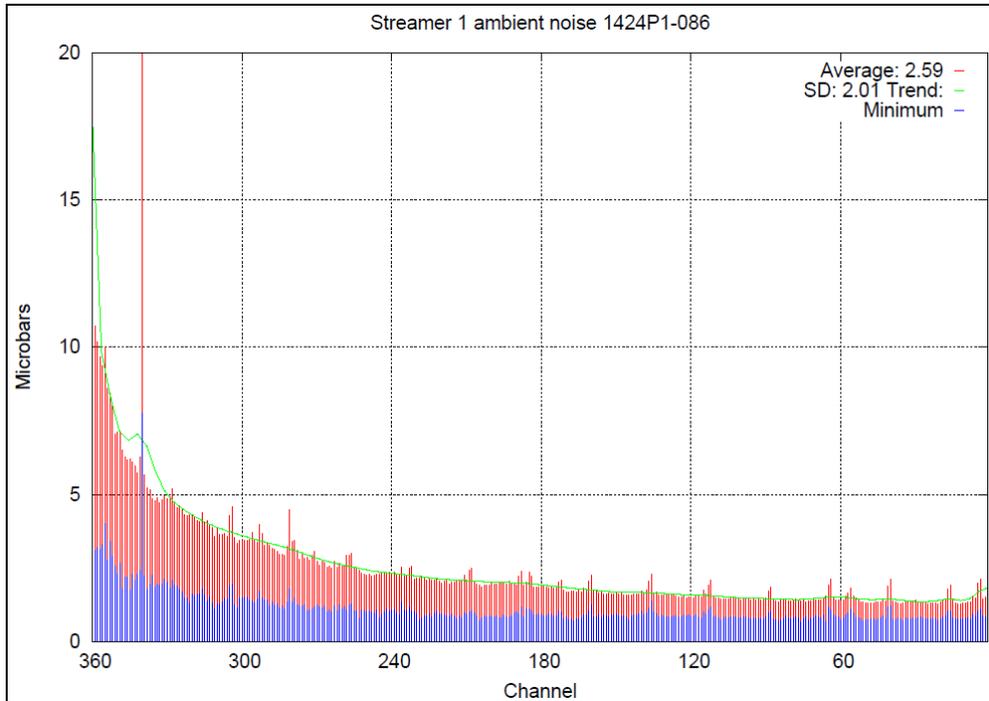

Figure 26: Ambient noise levels per channel, example from line G06A-1424P1-086

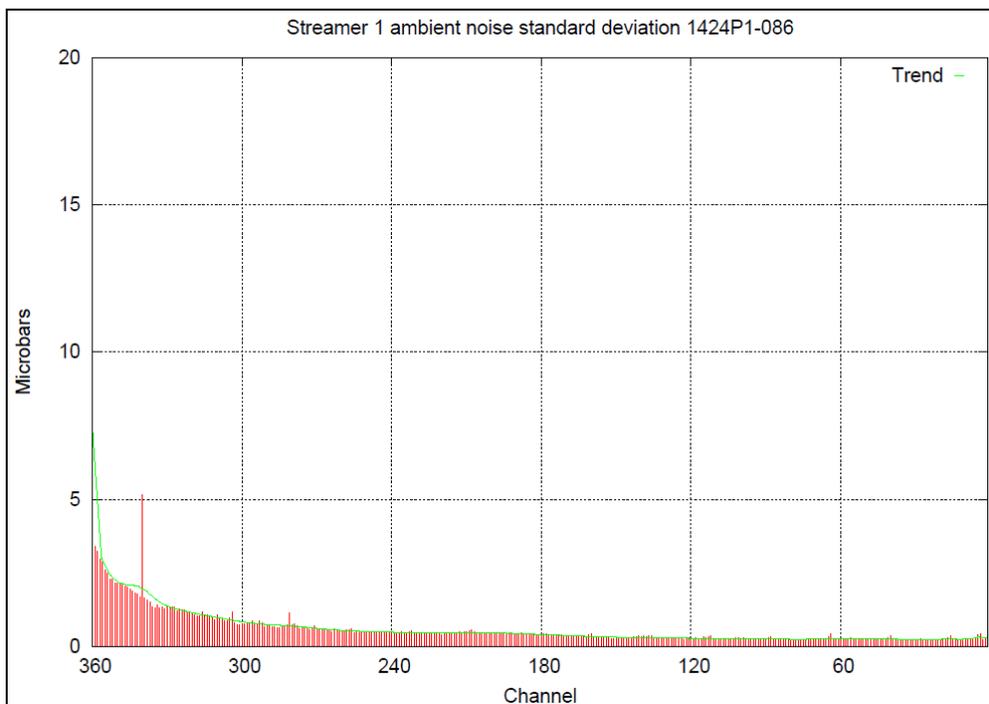

Figure 27: Standard deviation in noise levels per channel, example from line G06A-1424P1-086

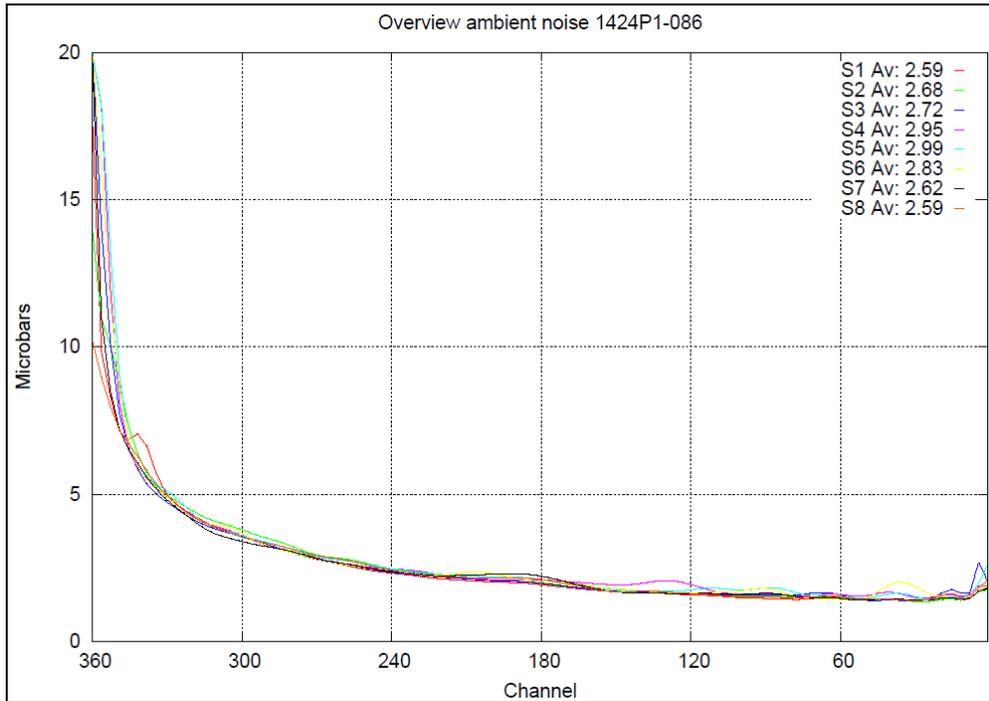

Figure 28: Ambient noise levels per channel, per streamer for sail line G06A-1424P1-086

The ambient noise data are also displayed for each channel in every shot record in attribute map format; an example is displayed in Figure 29. Noisy channels will show up as bright coloured vertical lines.

The ambient noise level averaged per shot over a sail line, excluding the nearest channels from each streamer, is displayed in Figure 30. The signal-to-noise ratio was calculated using the ambient noise window RMS values and the RMS values from the ‘Signal RMS window’ as indicated in Figure 25.

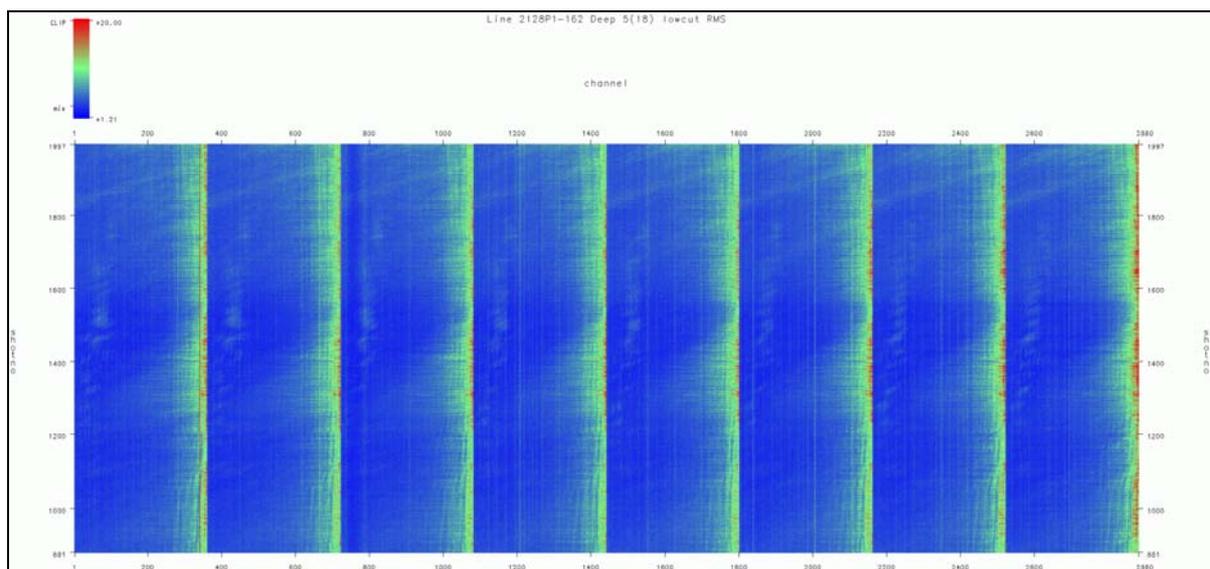

Figure 29: Example ambient RMS Amplitude analysis for line G06A-2128P1-162 (μB display).

Even though the 'Signal RMS' window is not necessarily the geological target, if kept consisted throughout the survey, meaningful conclusions can be drawn based on these as to the general quality of an acquired line.

Figure 31 and Figure 32 and display this information per streamer (data are smoothed in order to see differences). As no single streamer stands out significantly, either in ambient noise levels or in signal-to-noise ratio, it is safe to assume that all streamers behave similar in similar conditions and have similar noise characteristics.

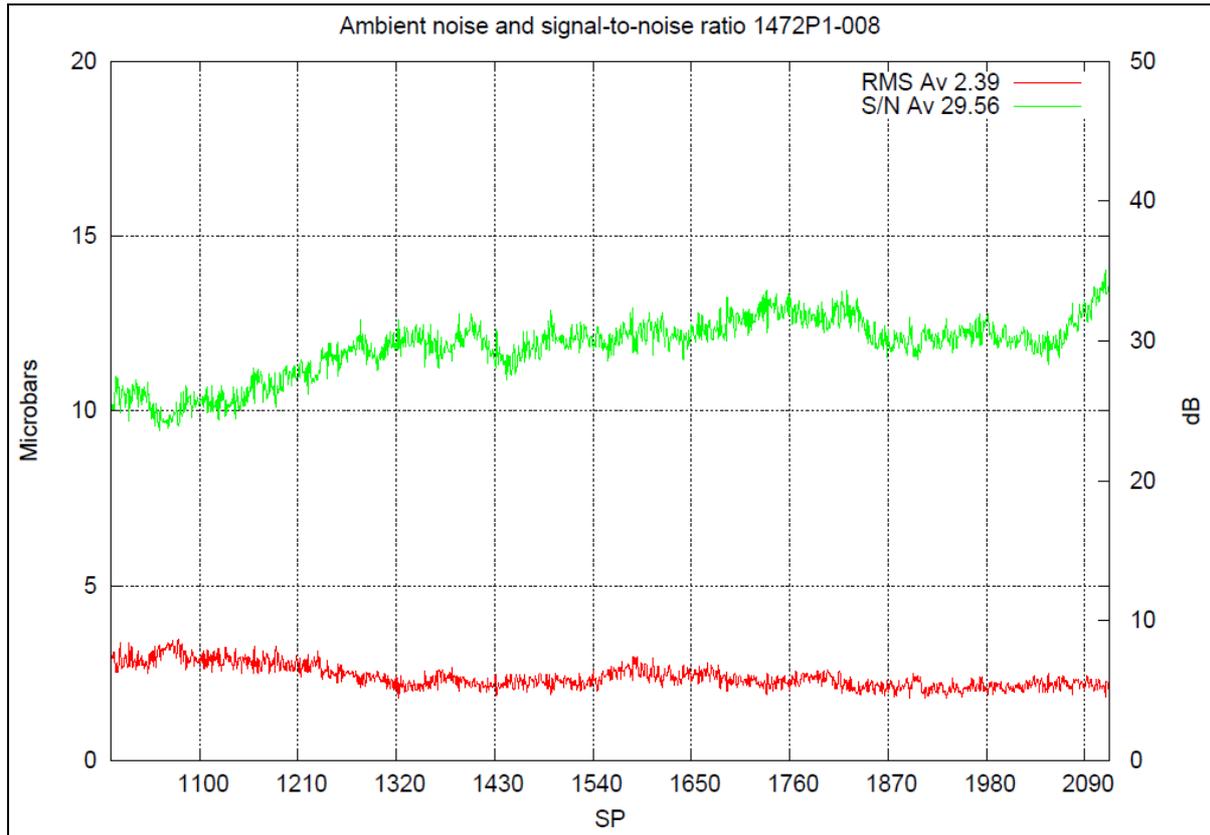

Figure 30: Average ambient noise and signal-to-noise ratio example for line G06A-1472P1-008

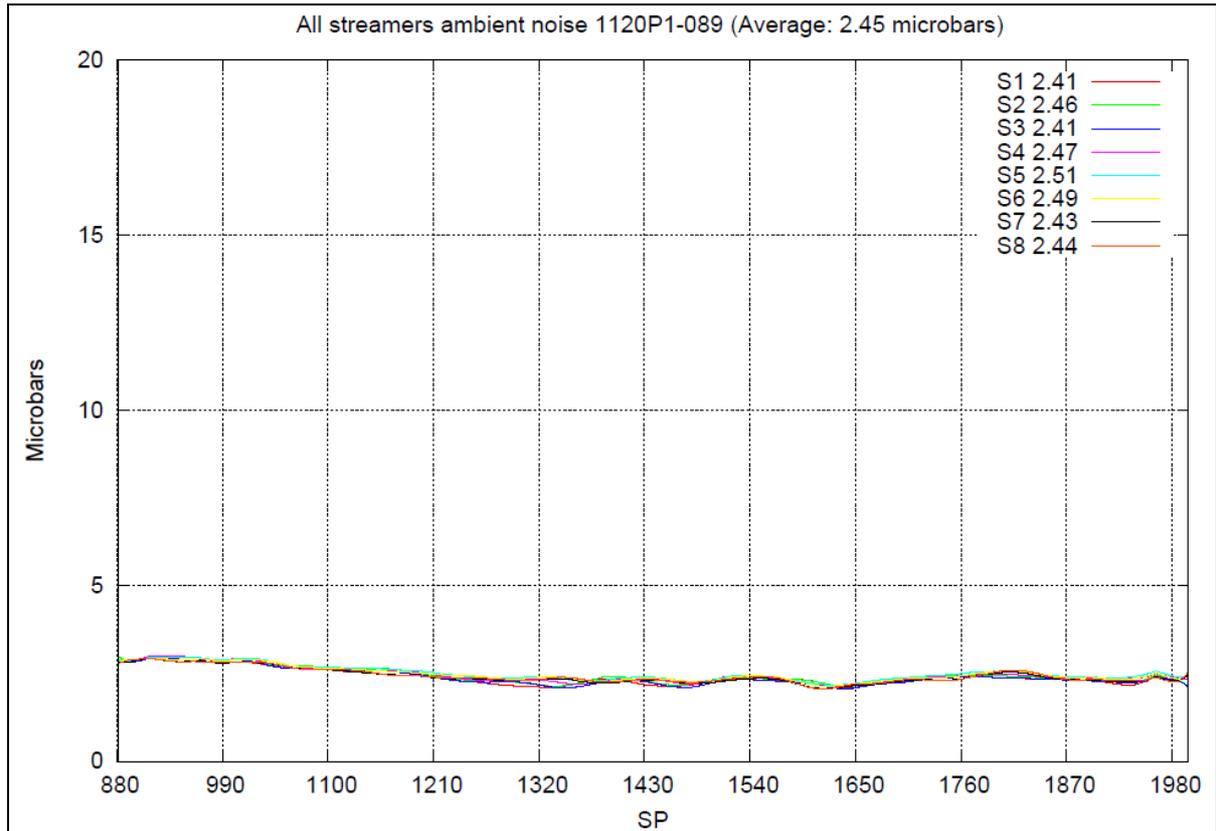

Figure 31: Average ambient noise per streamer per shot for line G06A-1120P1-089

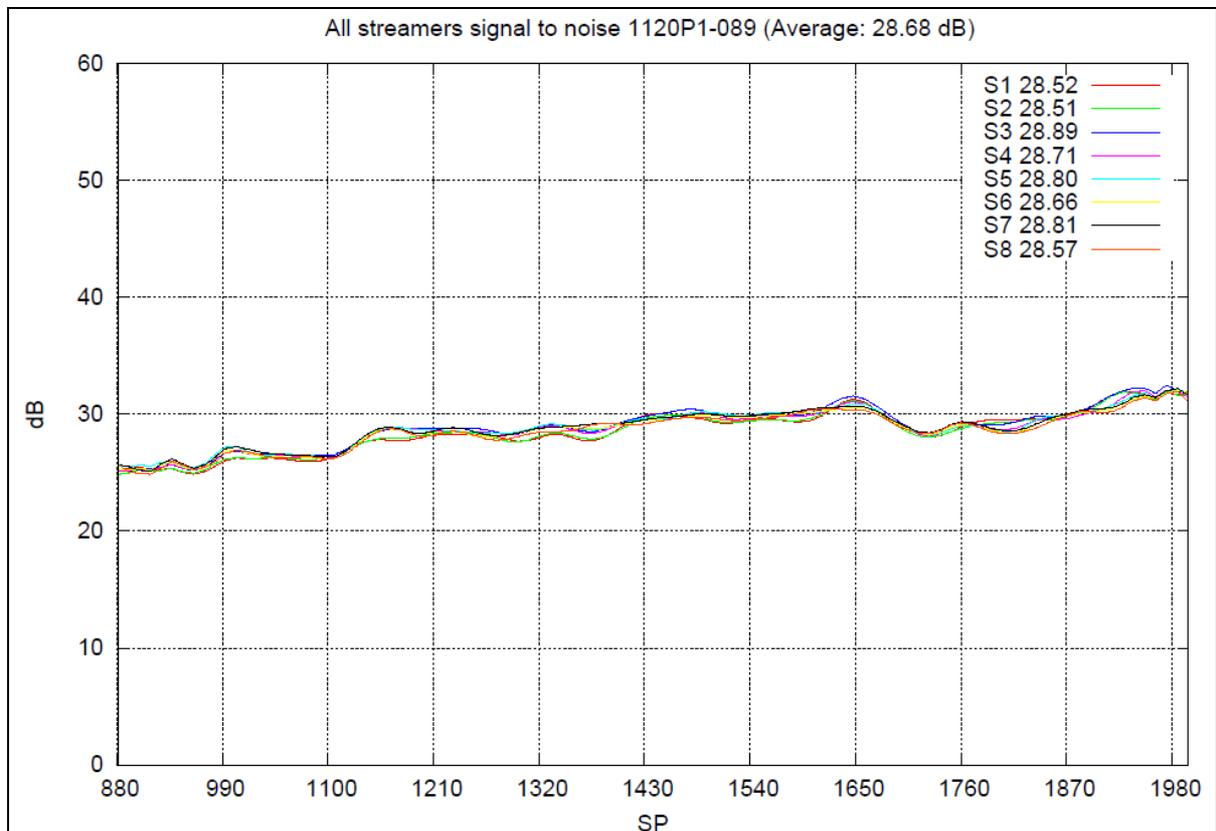

Figure 32: Average signal-to-noise ratio per streamer per shot for line G06A-1120P1-089

On lines acquired in increased sea states, differences between streamers may become visible because of slightly different ballasting and different behaviours of the depth controllers attached to the streamers.

Figure 33 displays the signal-to-noise and ambient noise levels per acquired sequence. As a rule of thumb, an average of over 4 microbars would normally indicate that the line (e.g. sail line G06A-2048P1-144 – 5.24 microbars) was noisy and was subject to review by the onboard QCs utilising the full suite of data quality control products.

Figure 34 displays the SOL ambient noise levels per sail sequence throughout the survey. High peaks in the graph generally coincide with increased sea states.

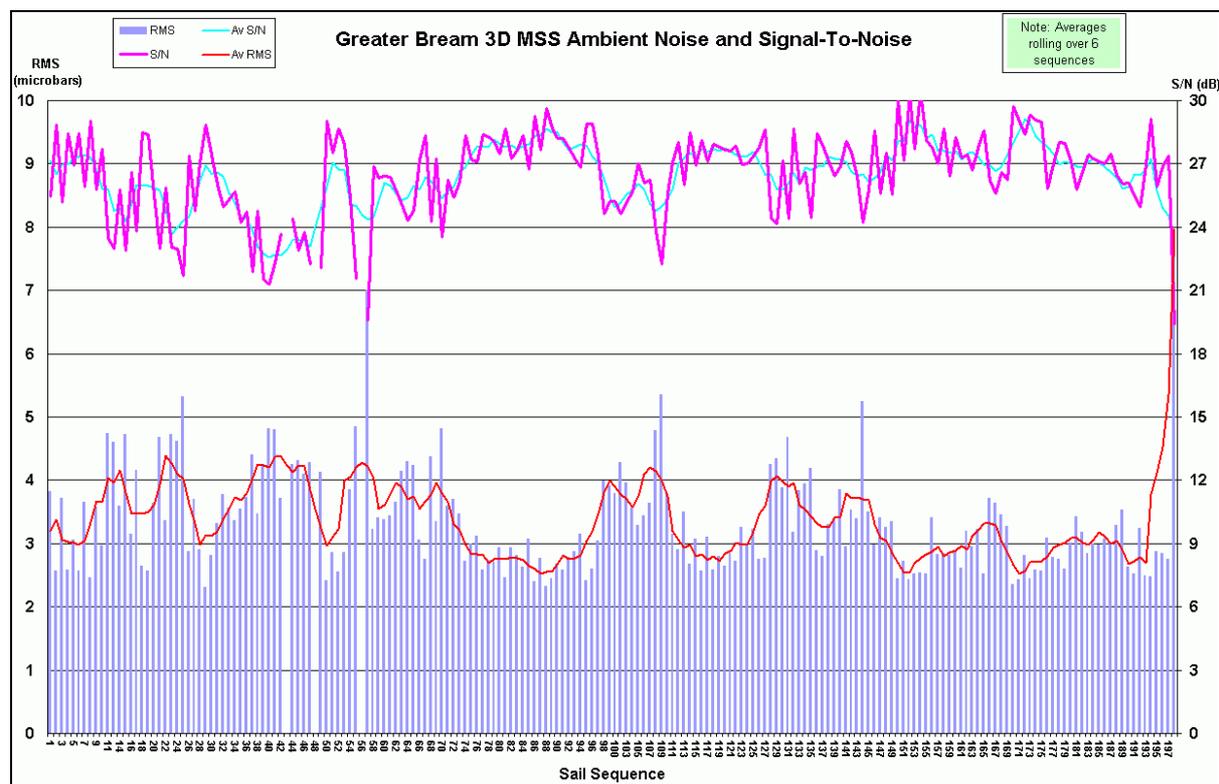

Figure 33: Average ambient noise levels and signal-to-noise ratio per sail sequence

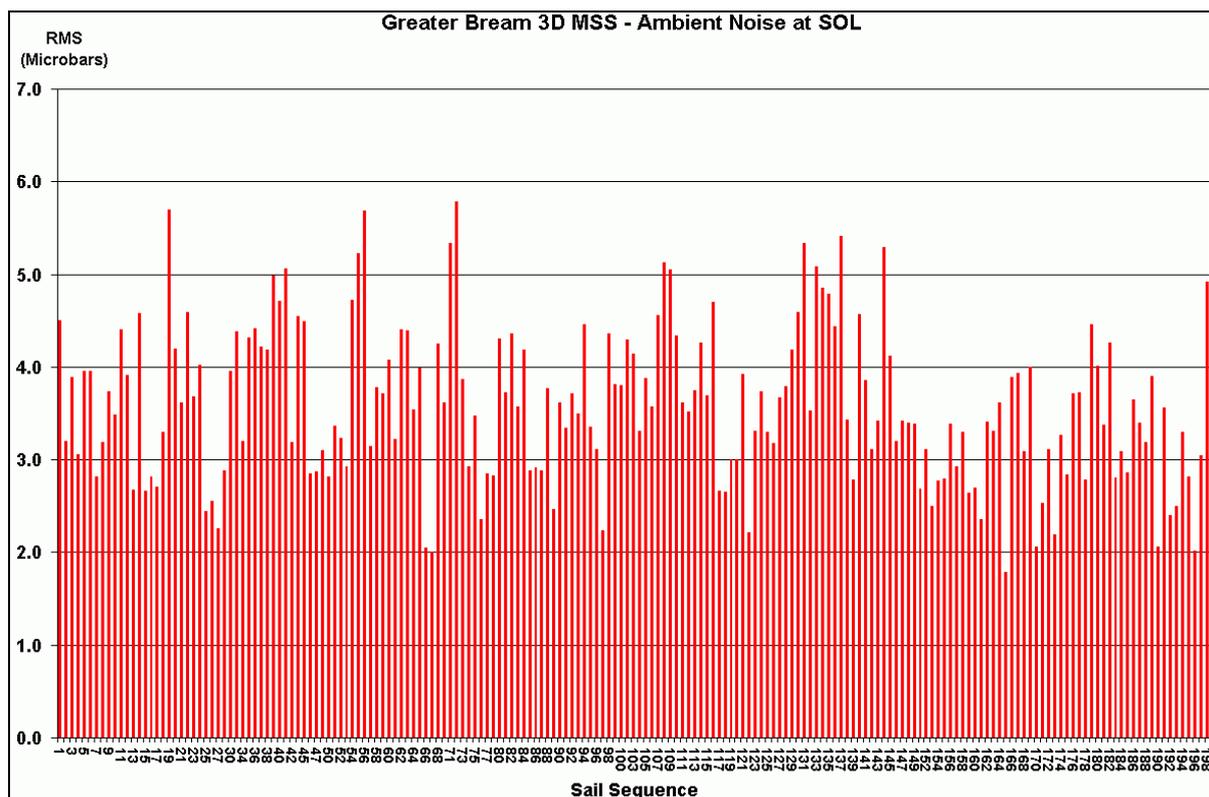

Figure 34: Data from SOL noise analysis throughout the survey period

3.4.7 STREAMER SENSITIVITY

A standard part of every survey is to verify the streamer sensitivity. To this end, a channel-to-channel sensitivity check was performed after every line and the results were graphed. An example is displayed in Figure 35. The input data for this process was an autocorrelation over a 1000 ms window over the part of the shot record that contained most of the signal (150 ms before the expected water bottom reflection and 850 ms below), any channel that was found to be more than 3 dB different from its adjacent channels, was considered bad. Note that differences from channel to channel are exaggerated because ‘real’ data was used for this verification. In addition, the outcome of this test is very dependent on the chosen window and the data that is present in that window.

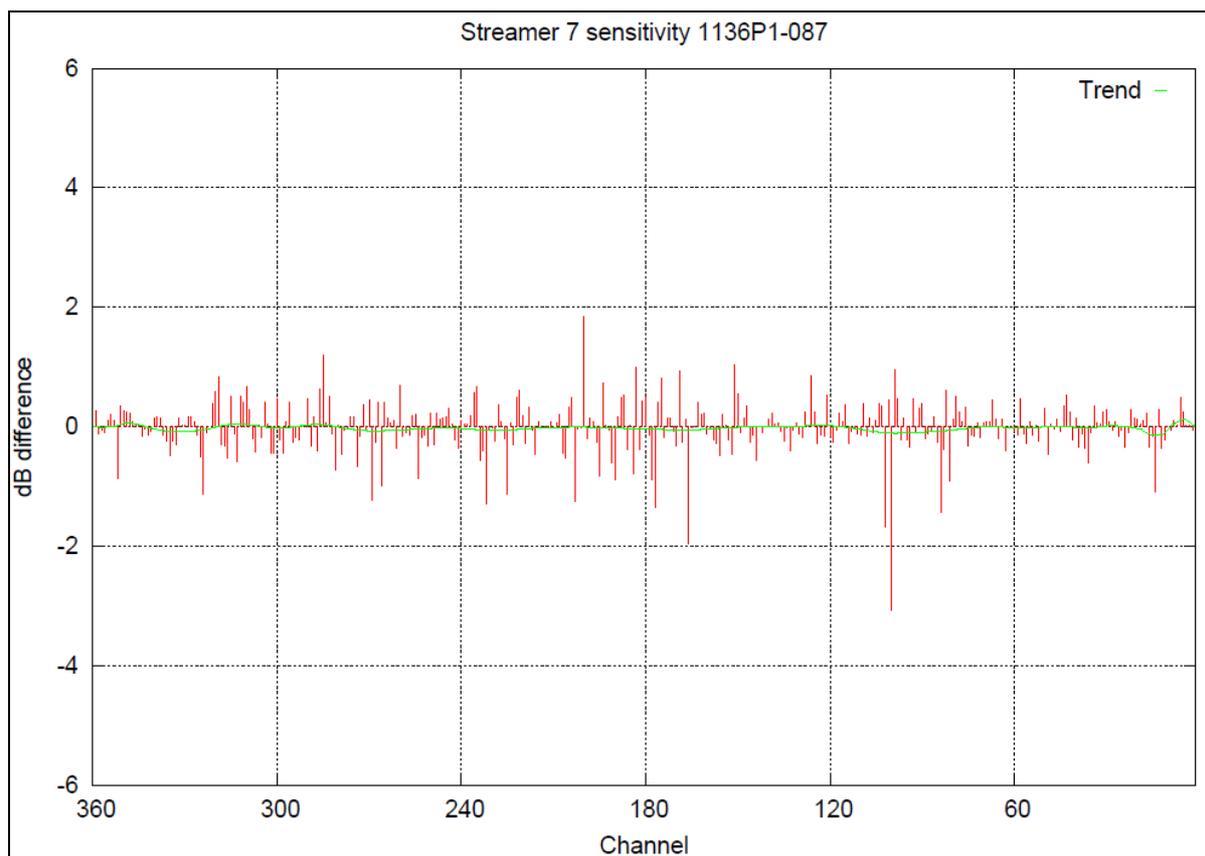

Figure 35: Channel to channel sensitivity verification example for one streamer.

3.4.8 SOURCE-TO-SOURCE OUTPUT COMPARISONS

In addition to the noise monitoring, a quality check on the source array performance was produced for each line. The values used in the displays are calculated from autocorrelations over 51 near traces from all streamers. The 'energy' of the signal was then converted to decibels. In the graph in Figure 36, the port and starboard arrays should track one another closely. Differences between port and starboard array are displayed in Figure 36. In this particular example, one of the elements (P-2 at 220 cu in) on the stbd array was turned off at SP 2027 causing a very slight drop in output.

Differences due to geology, spread layout or sea state should change very little from shot to shot so this method provided an accurate indication of source energy output and consistency from source-to-source. However, geology, spread layout and sea state change throughout the line will cause local variations in the absolute value.

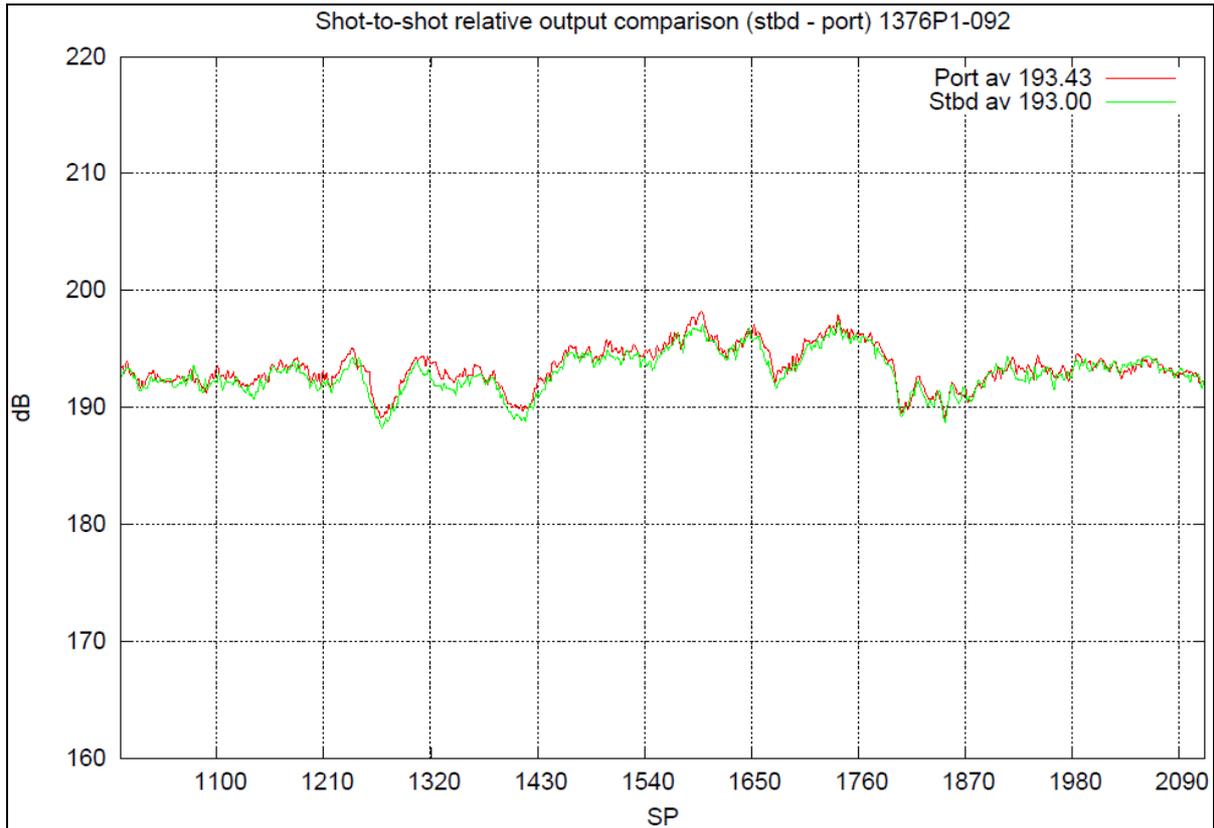

Figure 36: Source array port-stbd relative output versus shot point

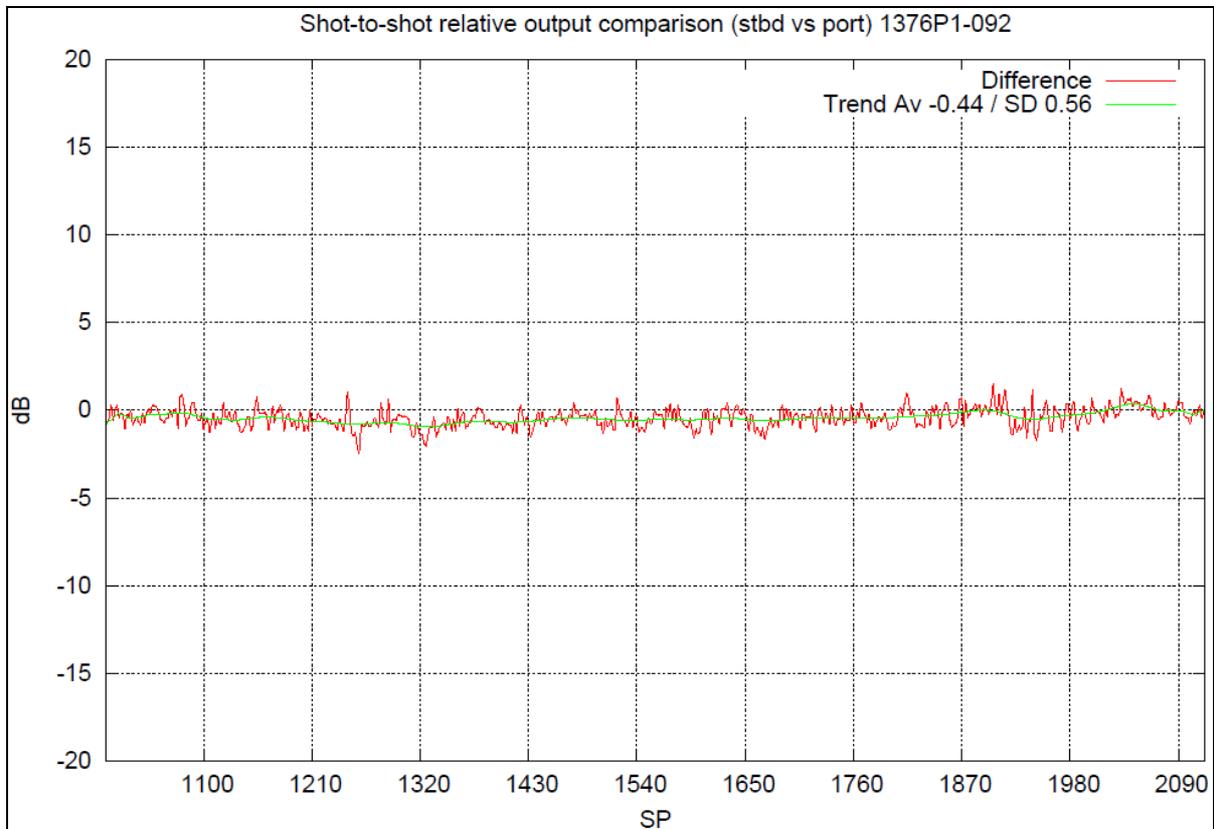

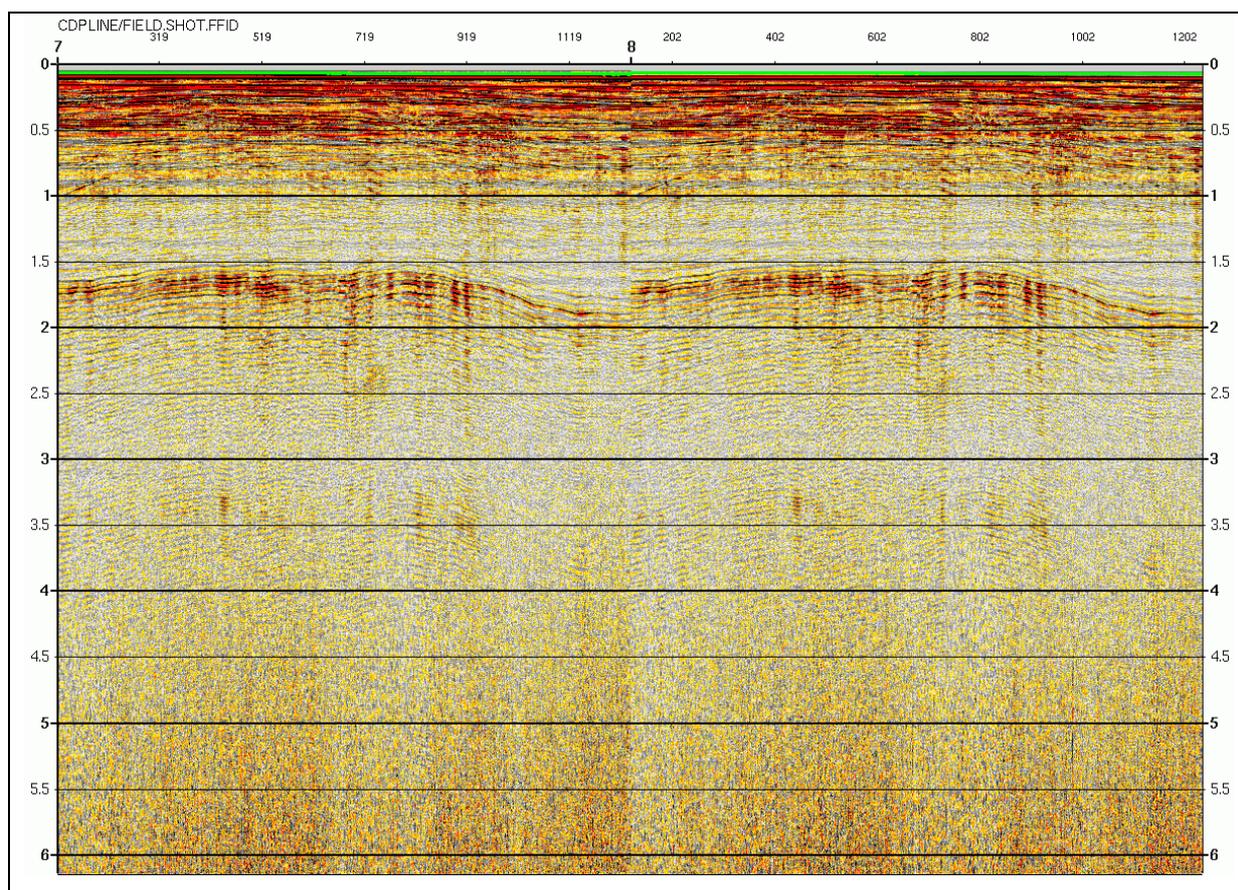

Figure 37: Source array port-stbd output difference

3.4.9 NEAR TRACE DISPLAY

The near trace (Figure 38 displays streamer 4 for the port and starboard sources respectively) is selected from each streamer to produce a single fold representation of the acquired data. These displays are mainly used in the detection of auto fires, source switches and to verify that certain header values (e.g. the water depth as indicated by the green line) for subsequent processing have been assigned correctly.

3. Selective trace edits
4. Select one streamer-source combination (cycle through all combinations on line by line basis)
5. Amplitude recovery using V^2T function
6. Apply 2D basic geometry and reorder to 2D CMP gathers
7. Apply NMO using water depth dependent regional velocity function
8. Far offset trace mute
9. Inner trace mute
10. CMP stack, 60 fold
11. Display gain 4 dB/sec from 2.5 seconds to 5 seconds

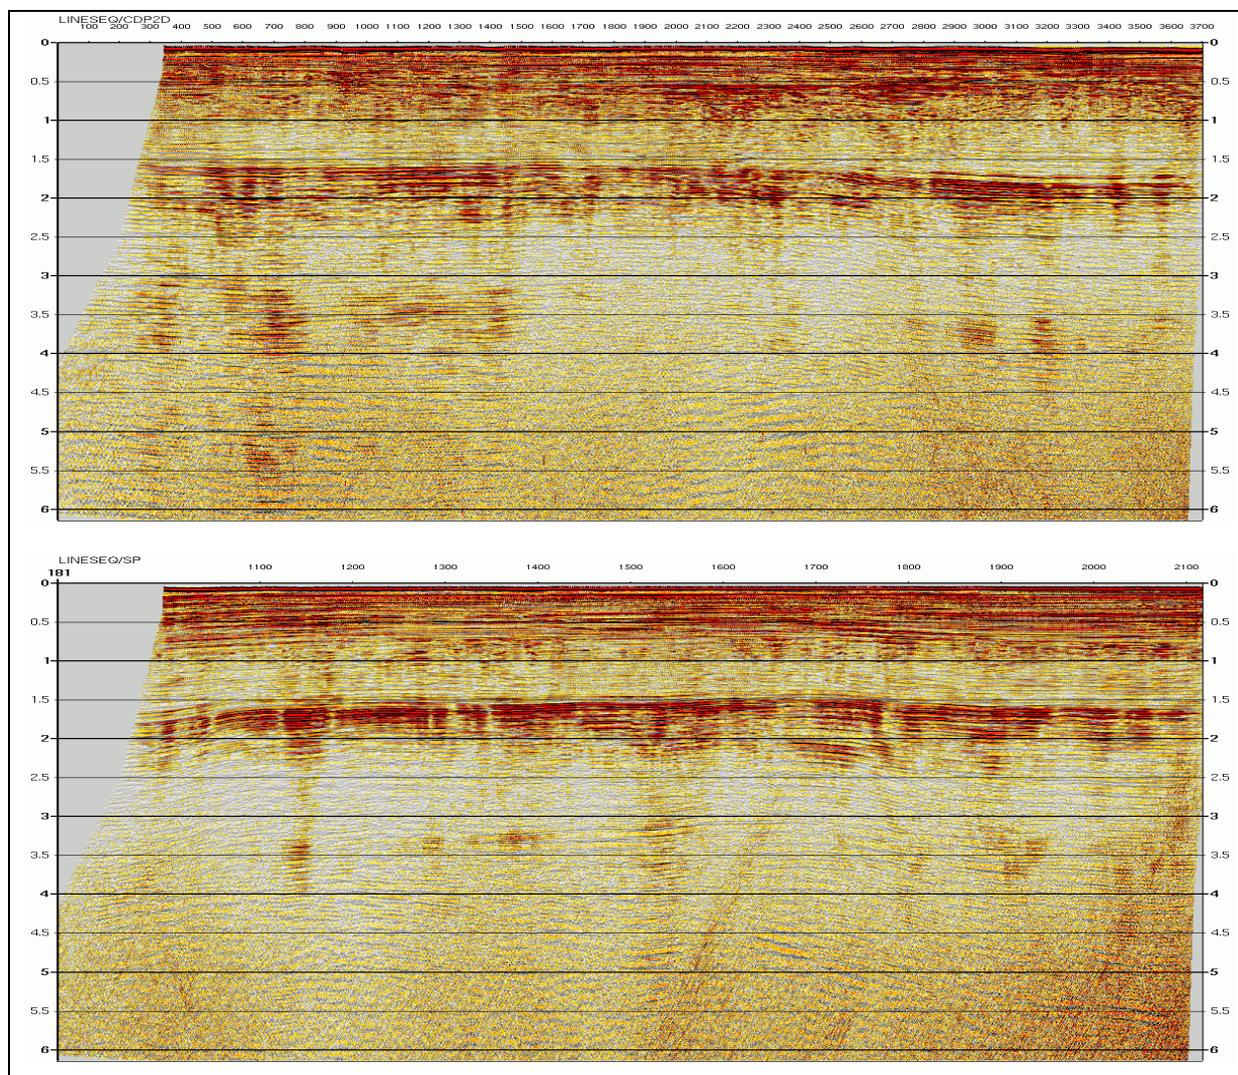

Figure 39: Example brute stack displays from lines G06A-1152P1-083 and G06A-2208F1-181

Screen displays of all initial brute stacks are available in the Document Archive section of the CD-ROM and included as SEG Y format files on tape in the final shipment.

At this point, the data were saved to disk for two separate flows of further processing:

- The onboard raw 3D quality control stack
- Input to the full processing flow to be completed onshore at the Veritas DGC Singapore Processing Centre

At this stage, processed shot records were saved to SEG-Y format and included as a final deliverable. A description of the SEG-Y format used (including the EBCDIC header, binary header and line header) is included in the Document Archive section of the CD-ROM and in the Appendix of this document.

3.4.11 NAVIGATION-SEISMIC MERGE QUALITY CONTROL

A critical step in the onboard quality control scheme is the verification of the merging of seismic and navigation data. Occasional problems that arise from incorrect navigation processing are flagged at this stage and, if required, reverted to onboard navigation processing for review and correction in order to ensure a high quality processed final P1/90 file.

Two checks are used in order to verify the merge. For both methods, the navigation data are merged with the near traces.

For the first check, a linear move-out correction is applied based on the prevalent acoustic velocity for the line in question (an average from the streamer mounted velocity meters verified using results from a recent TS dip). Theoretically, this moves the direct arrivals on all streamers to a common level in time. The actual result is then checked against the theory using displays such as the one in Figure 40. For a valid merge, the onsets of the direct arrival must fall within the limits indicated in the display, the acceptance values indicating a time of 3 ms either side corresponding to approx. 4.5 m from the real world position. The blue lines indicate a visual representation of the changes in offset value from the navigation data; the red lines indicate the minimum and maximum onset times for acceptance. The shape and timing of the onset of the direct arrival is dependent on the distance from nearest element in the source array to the nearest hydrophone on the streamer.

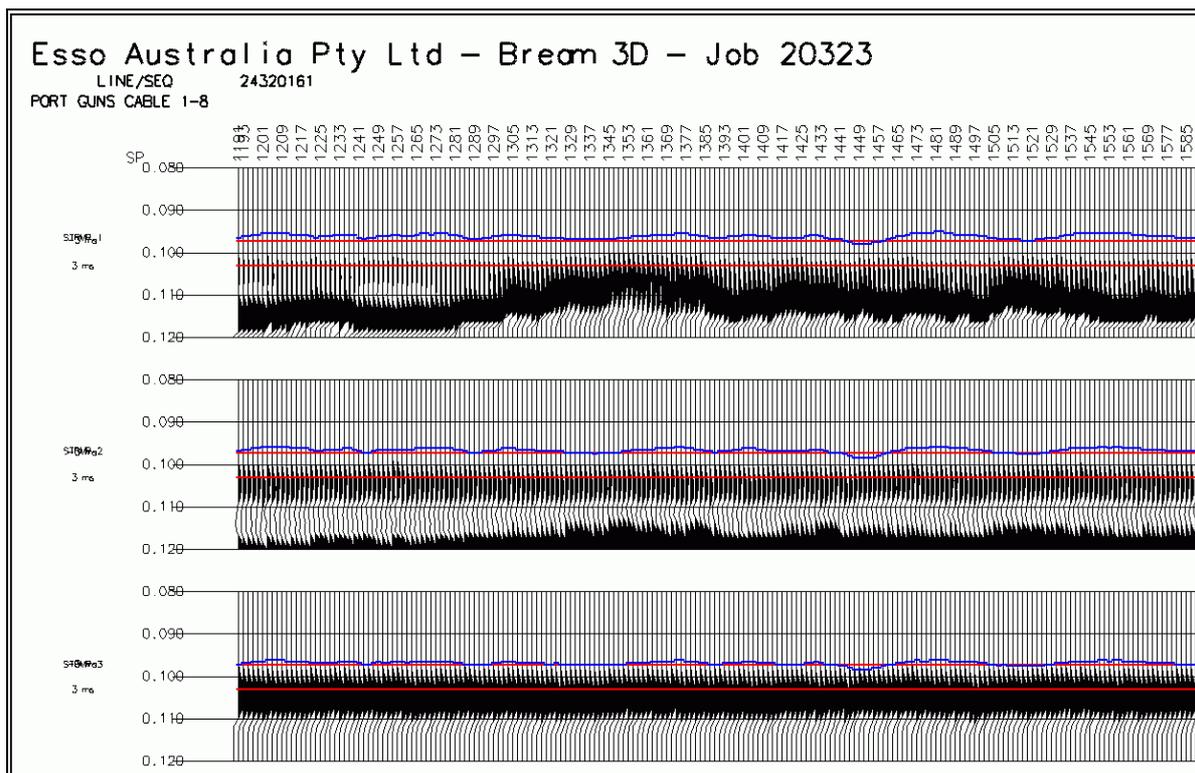

Figure 40: Example of navigation-seismic merge quality control

The second check is to load all these near traces in a single fold cube, after correcting for normal move-out and tidal statics. Example time slices are displayed in Figure 41; these data were loaded onto the 37.5x25 acquisition geometry. Onboard personnel verify that there are no unexplainable breaks in the crossline direction indicating either a problem with the navigation, changes in the acoustic velocity or unpredicted tidal variations causing static shifts in the data.

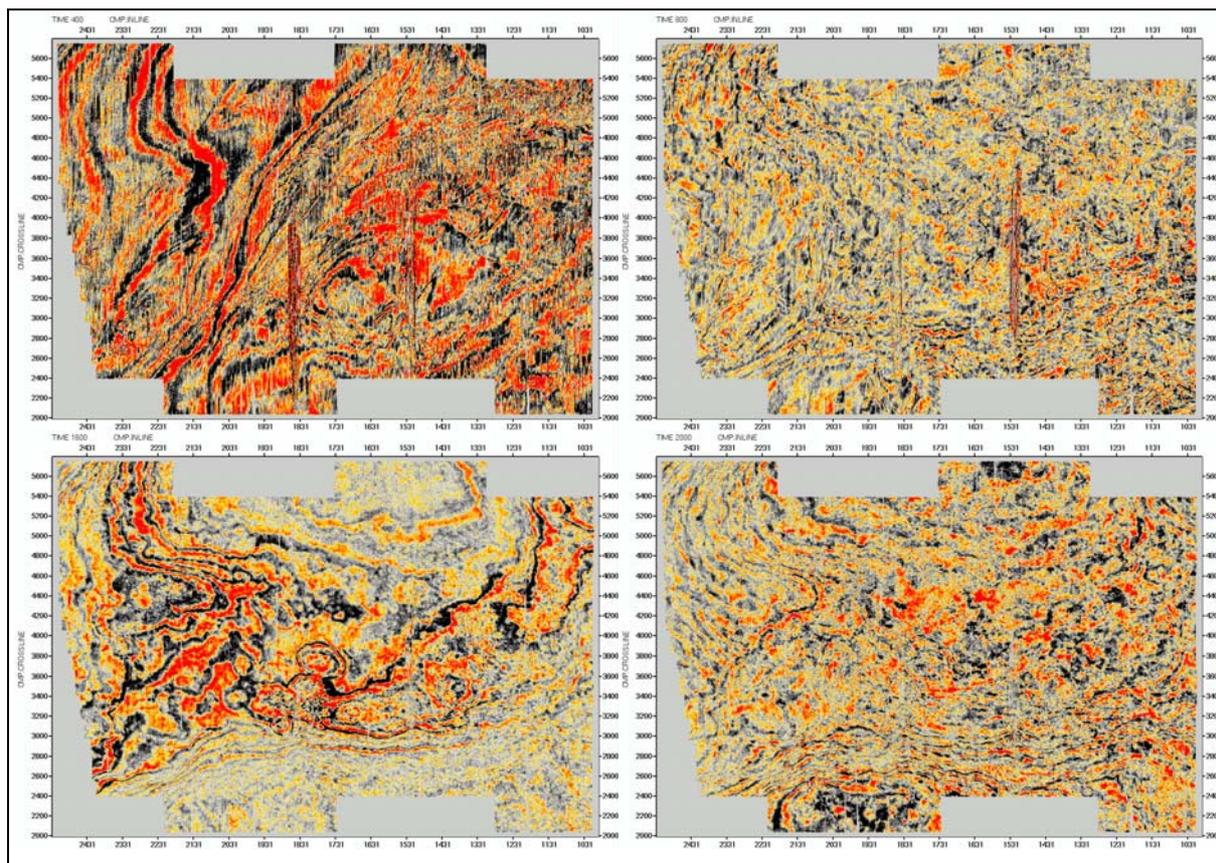

Figure 41: Time slices at 400, 800, 1600 and 2000 ms from the near trace cube

3.5 SEISMIC DATA PROCESSING

In addition to the basic QC processing described above, a pre-processing flow was implemented onboard and used as the starting point for both an onboard 3D stack and initiating a full processing sequence to be completed in the Veritas DGC Singapore Processing Centre.

3.5.1 TRACE AND SHOT EDITS

The first step in the pre-processing flow was to apply the trace and shot edits. All channels labelled 'bad' during the quality control stage are set to zero amplitude as well as shots with autofires, misfires and all delta errors greater than 1.5 ms. Any anomalously high amplitudes encountered are also set to zero.

3.5.2 LOW-CUT AND TEMPORAL ANTI-ALIAS FILTERING AND RESAMPLE

A 3(12) Hz (dB/oct) low cut filter was applied to attenuate low frequency noise caused by the sea state. In addition, a 94(132) Hz (dB/oct) high-cut filter was applied prior to resample to 4 ms. During the processing sequence, these 2 filters were applied in one pass, the filter

diagnostics are displayed in Figure 42. The filters applied to real data and their corresponding frequency spectra are displayed in Figure 43

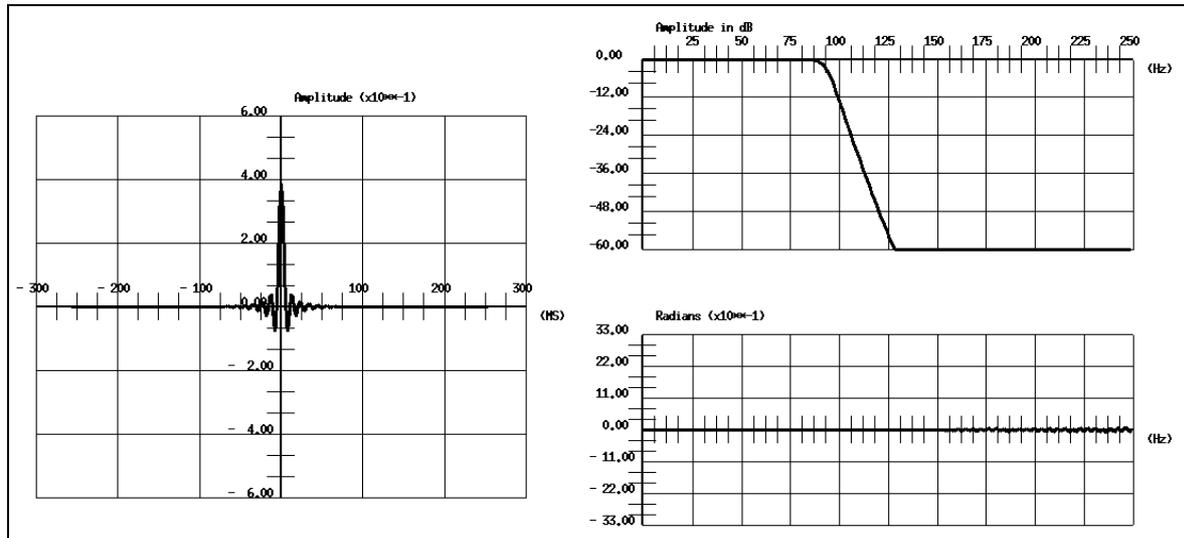

Figure 42: The combined low-cut and temporal anti-alias filter: 94(132) Hz(dB/oct)

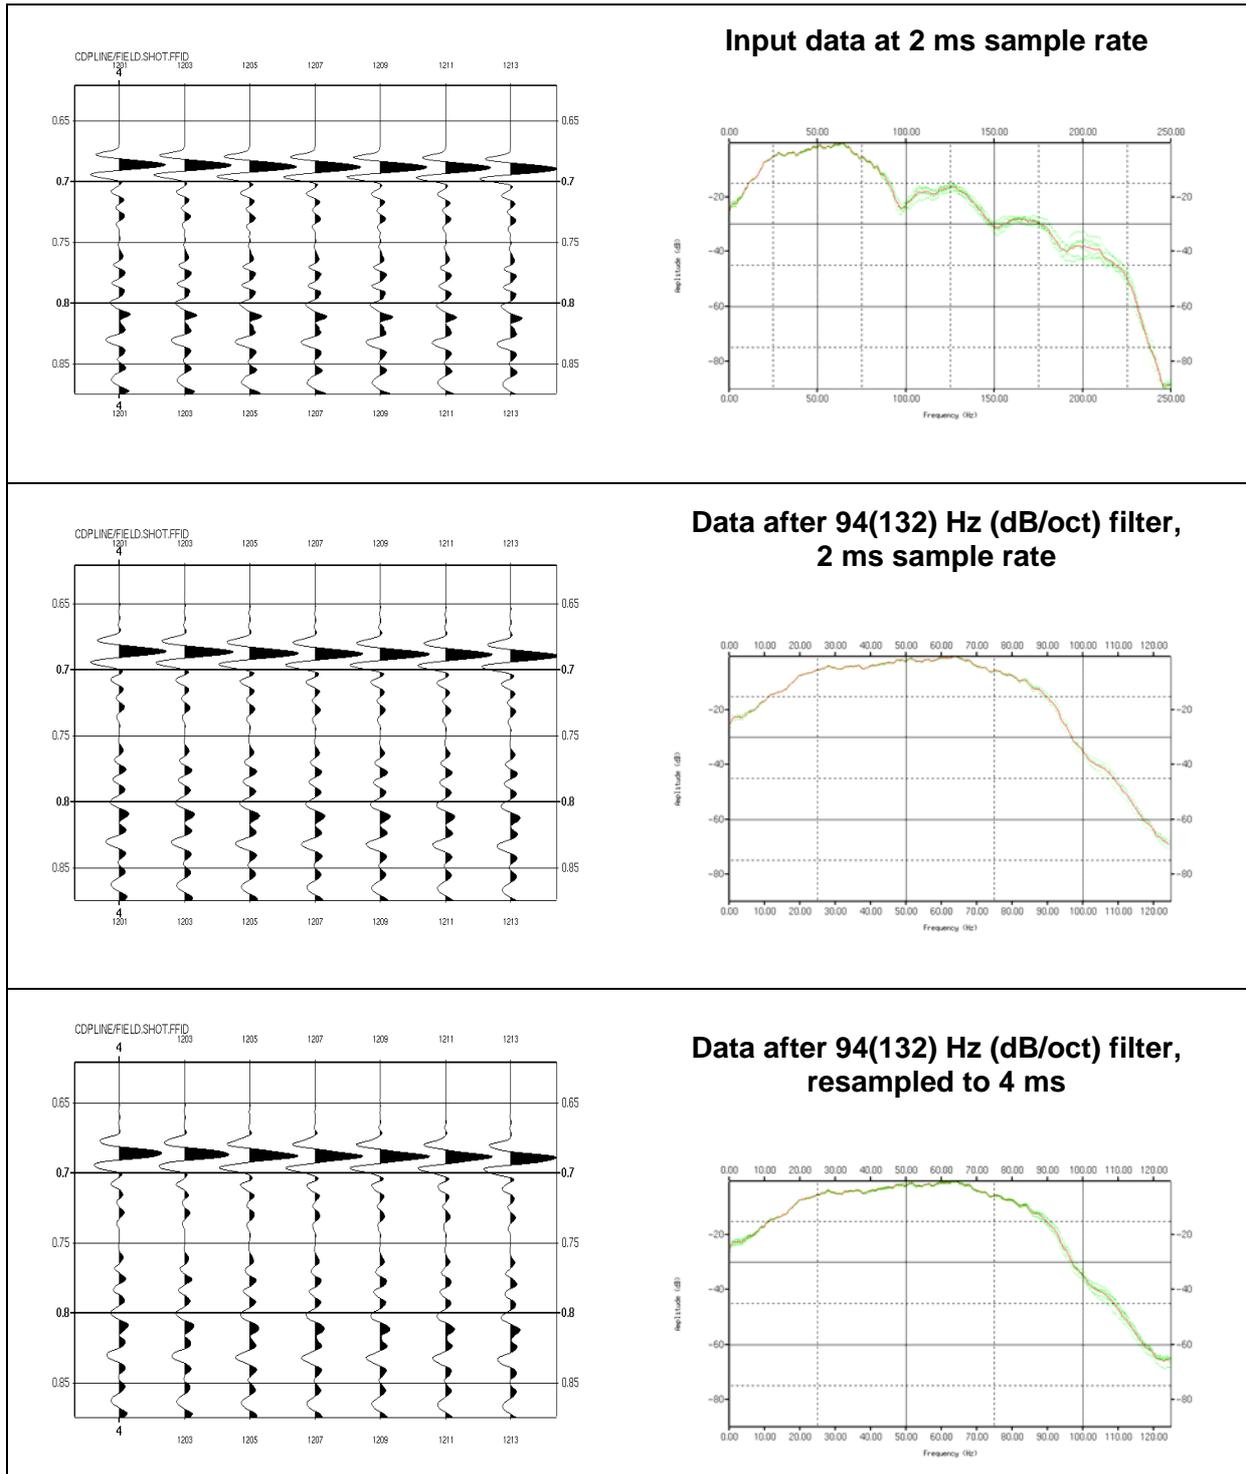

Figure 43: Low-cut and anti-alias filter diagnostics on real data

3.5.3 TRUE AMPLITUDE RECOVERY

Following testing earlier in the sequence, it was decided that a simple V^2T spherical divergence correction best restored the true amplitude condition of the data. Velocities used were 1500 m/s at $t=0$ and 4000 m/s at $t=6144$ ms.

3.5.4 RANDOM NOISE ATTENUATION

The variable weather conditions encountered on the Greater Bream 3D survey meant that an effective swell and random noise attenuation scheme had to be implemented to improve the signal-to-noise levels. The processing flow used two passes of Veritas' proprietary *fxedit* module. The module attenuates random noise by using complex prediction and projection filtering in the f-x domain. A two-pass approach was applied.

For the first pass, data are reordered to channel/CMP line order. This first pass is designed to attenuate low frequency noise, typically sea swell induced noise up to 20 Hz. For the second pass, data are reorder back into regular shot record/channel order and the remaining random noise at frequencies up to 125 Hz is attenuated. A water bottom protection time of 2 seconds on the near traces and 3.5 seconds on the far traces was honoured.

Statistics and displays as to the effectiveness were gathered throughout the survey. Figure 44 displays the effectiveness of the routine on a single shot record (from line G06A-1520U-056).

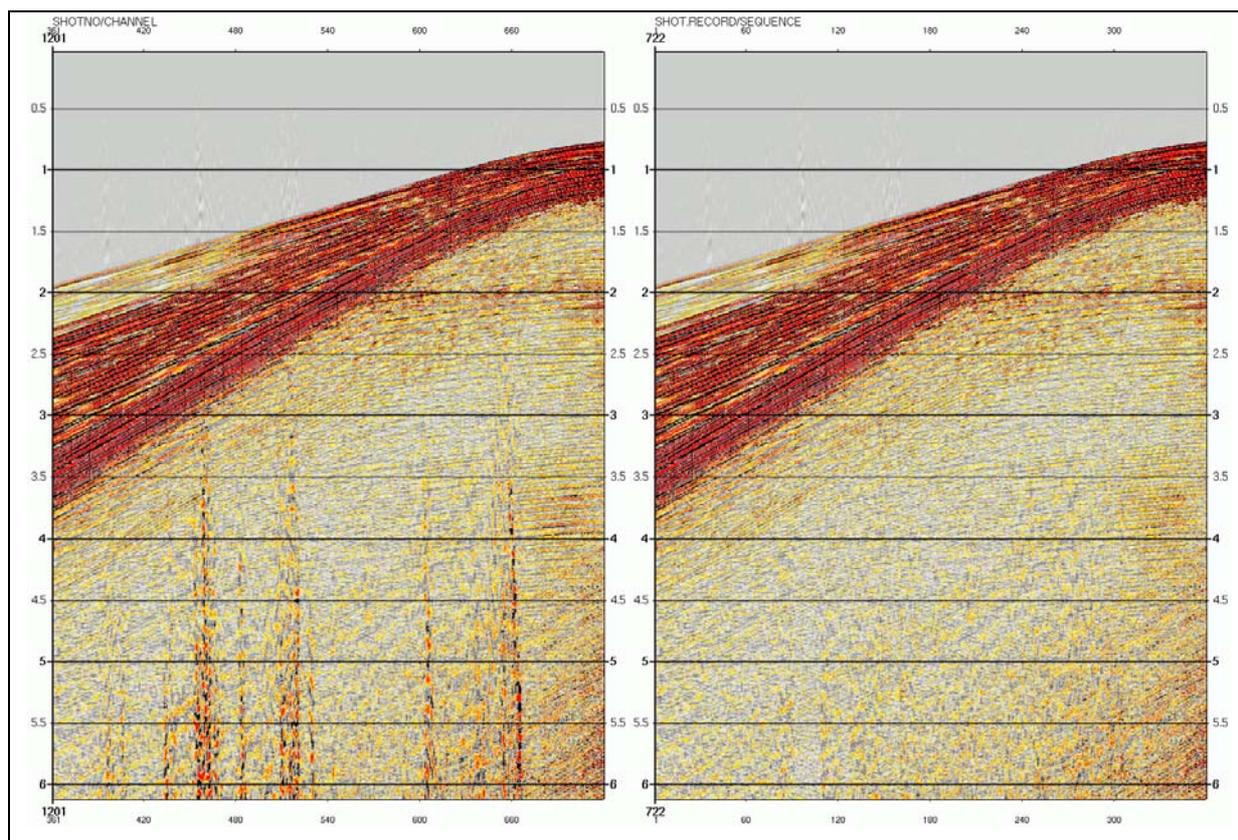

Figure 44: Example shot record before and after random noise attenuation

Additional testing was performed on sequences 11, 55, 56 and 57 where an additional low-cut of 5 Hz was applied to the *fxedit* passes in order to isolate the amount of swell noise that

was in the seismic about 5 Hz. The idea being that this could aid in quick decisions on butt-up infill. The following 2-pass approach was utilised:

1st pass parameterisation

- run in channel/CMP line order
- 201 trace window
- targeted frequency range of 0-20 Hz
- data gated into frequency spectra of 3 Hz
- an application window of 3500-6000ms on the far trace, and 2000-3500 on the near trace.
- tolerance factor of 1.8

2nd pass parameterisation

- run in shot order
- 81 trace window
- targeted frequency range of 0-125 Hz
- data gated into frequency spectra of 10 Hz
- an application window of 4200-6000ms on the far trace, and 2500-3500 on the near trace.
- tolerance factor of 2.5

All amplitudes within a gate are summed to create a median gate amplitude. On a trace by trace basis the gate amplitude is compared to the median amplitude, if the ratio is greater than the tolerance then the gate is bad, and the gate amplitude is scaled to that of the median amplitude.

Examples of the testing are included in the Document Archive section of the CD-ROM.

3.5.5 COMMON-OFFSET NEAR TRACE CUBE

Whilst the near-trace cube was a useful tool to verify the integrity of the navigation data, a drawback is that the near trace of each streamer does not honour the actual offset value; data from multiple offset zones contribute to the result due to the nature of multi-streamer acquisition. In addition, the acquisition pattern was obvious in the near trace cube. For this reason, it is Veritas' practice to also generate a raw data common-offset cube. For this survey, common offset data for 463-538 metres were loaded on a 6.25x25 metre grid (the '500m common offset cube'). This range of offsets, in preference to the near trace only, was used so that the noisier nearest traces at the head of the streamer were not used (except for

the outer streamers) and all data is from the same offset zone. From this cube of data, sublines, crosslines and time-slices were regularly extracted to check on geometry integrity, acquisition lineation, line-to-line noise levels, etc. Example timeslices are displayed in Figure 45. This cube is written to SEG-Y format and included in the final data shipment.

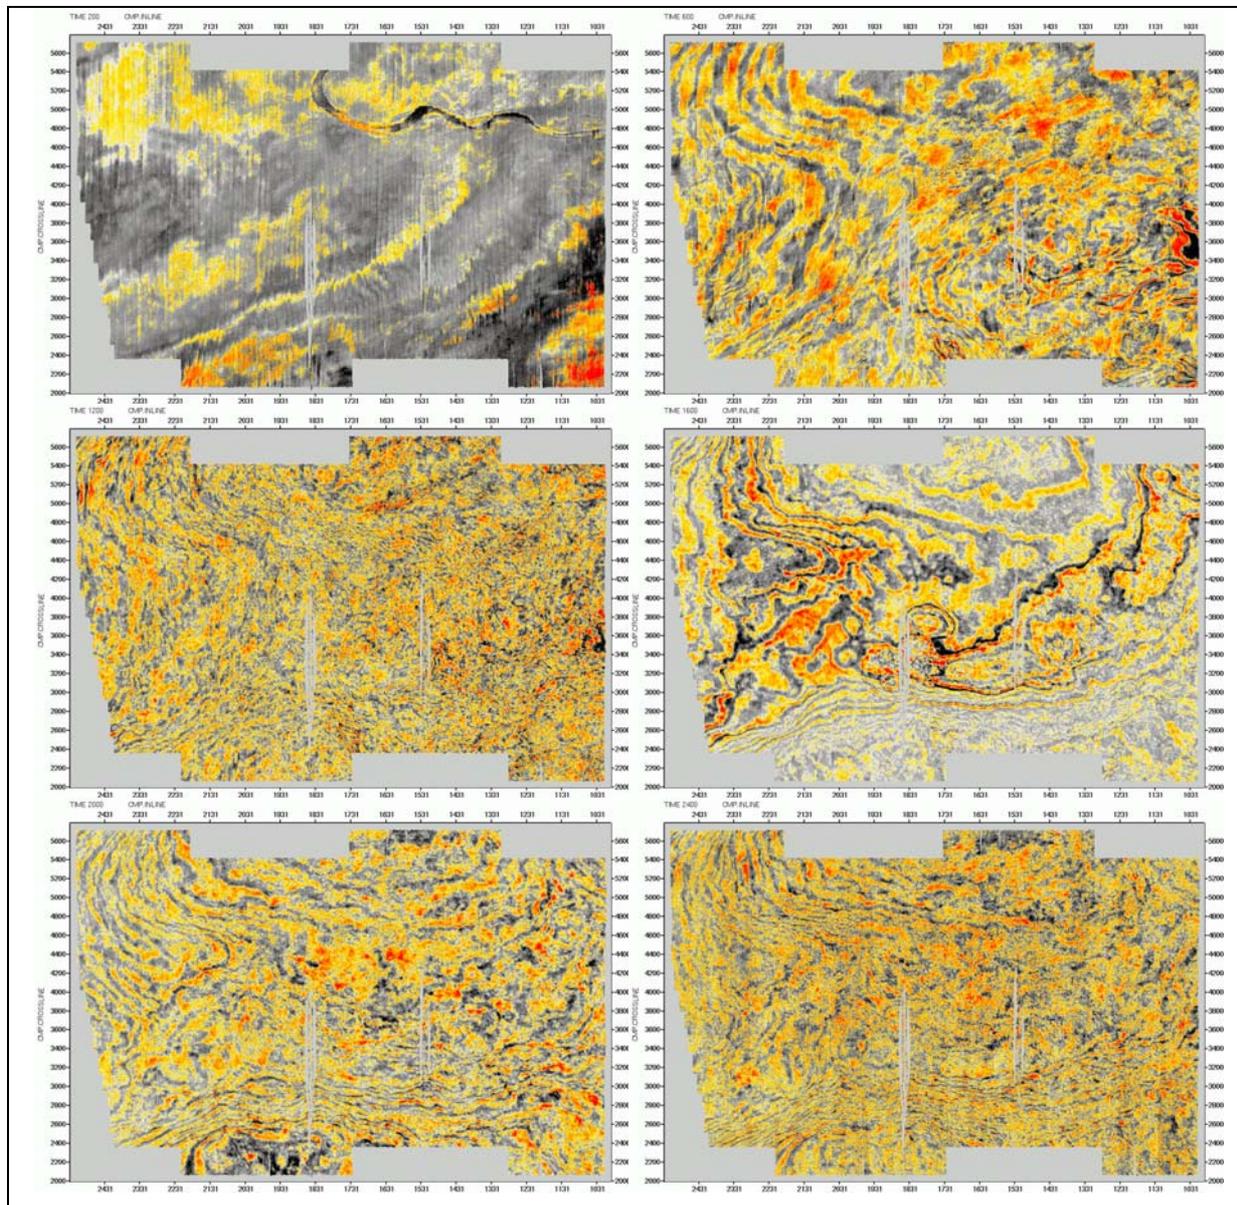

Figure 45: Time slice at 200, 600, 1200, 1600, 2000 and 2400 ms from the 500 m common offset cube

The common offset cube was saved in SEG-Y format and included as a deliverable.

3.5.6 VELOCITY ANALYSIS

Velocities were interactively analysed on a 1 by 1 km grid on subline ordered data.

Conventional 3D seismic data can typically be sparsely sampled, especially on the far offsets. Preparation of the velocity gathers consisted of selecting 13 sublines for all offsets,

centred on the chosen velocity subline. Each offset had missing data interpolated in crossline order for a maximum of five empty bins, prior to a reorder into 3D CMP gathers. This ensured full-fold gathers for accurate velocity analyses.

At survey completion, the final velocity field was exported to Veritas internal format and sent to the onshore processing centre. A representative isovel and 3D velocity time slice are shown below.

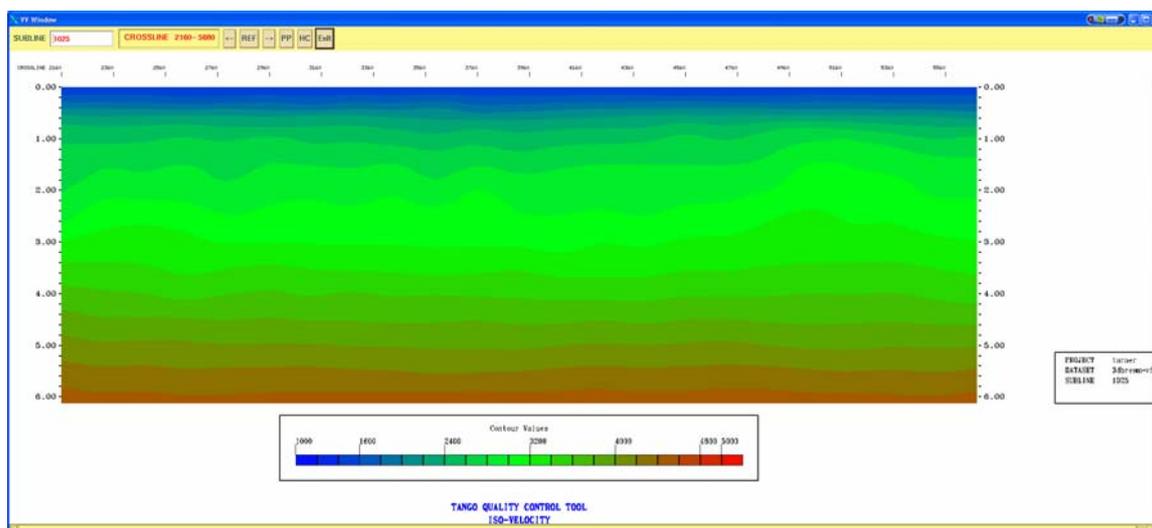

Figure 46: Example isovel from subline 1025

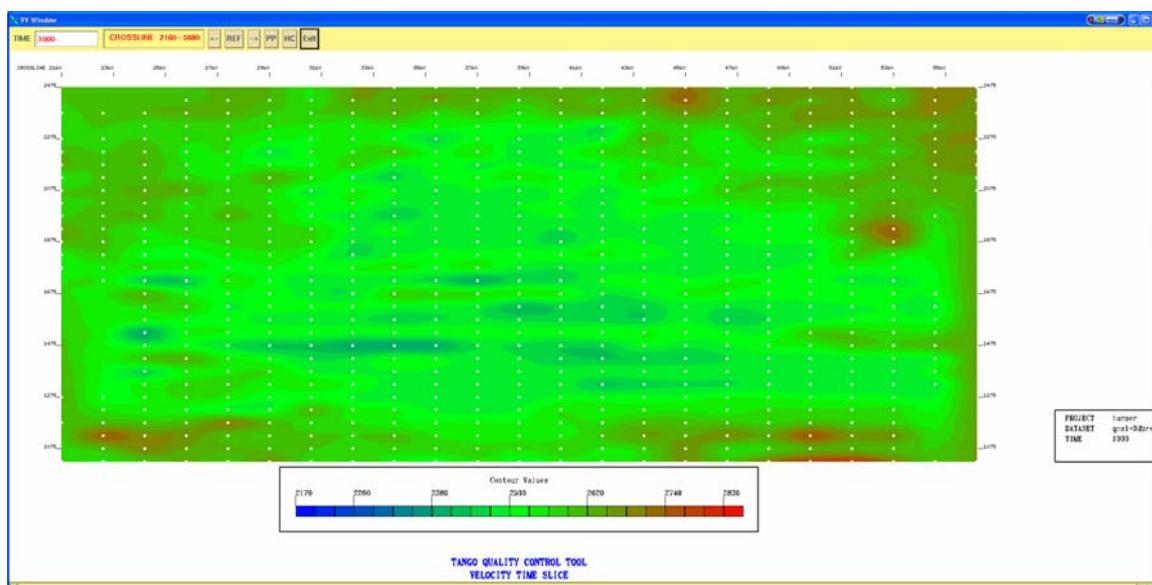

Figure 47: Example 3D velocity time slice (1000ms)

3.5.7 HIGH RESOLUTION LINEAR NOISE ATTENUATION

Veritas' high-resolution constrained linear radon transform – *xrlin* – was applied to the data in order to attenuate linear noise events. Figure 48 displays a shot record and the linear noise removed after the process.

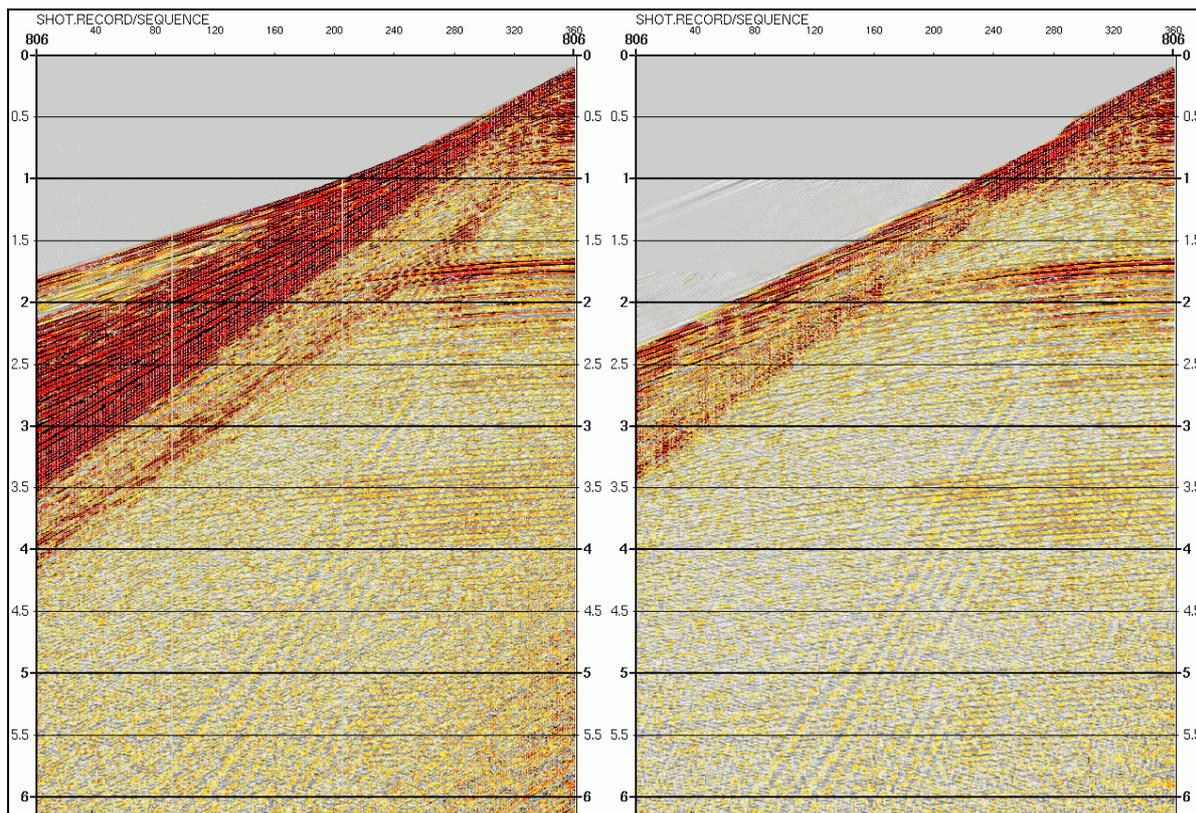

Figure 48: Shot gathers before and after high-resolution linear noise attenuation

3.5.8 RESIDUAL RANDOM NOISE ATTENUATION

At this stage the data underwent a further pass of random noise attenuation, targeting any remnant random noise. An example of the output and of the remnant random noise removed can be seen in Figure 49.

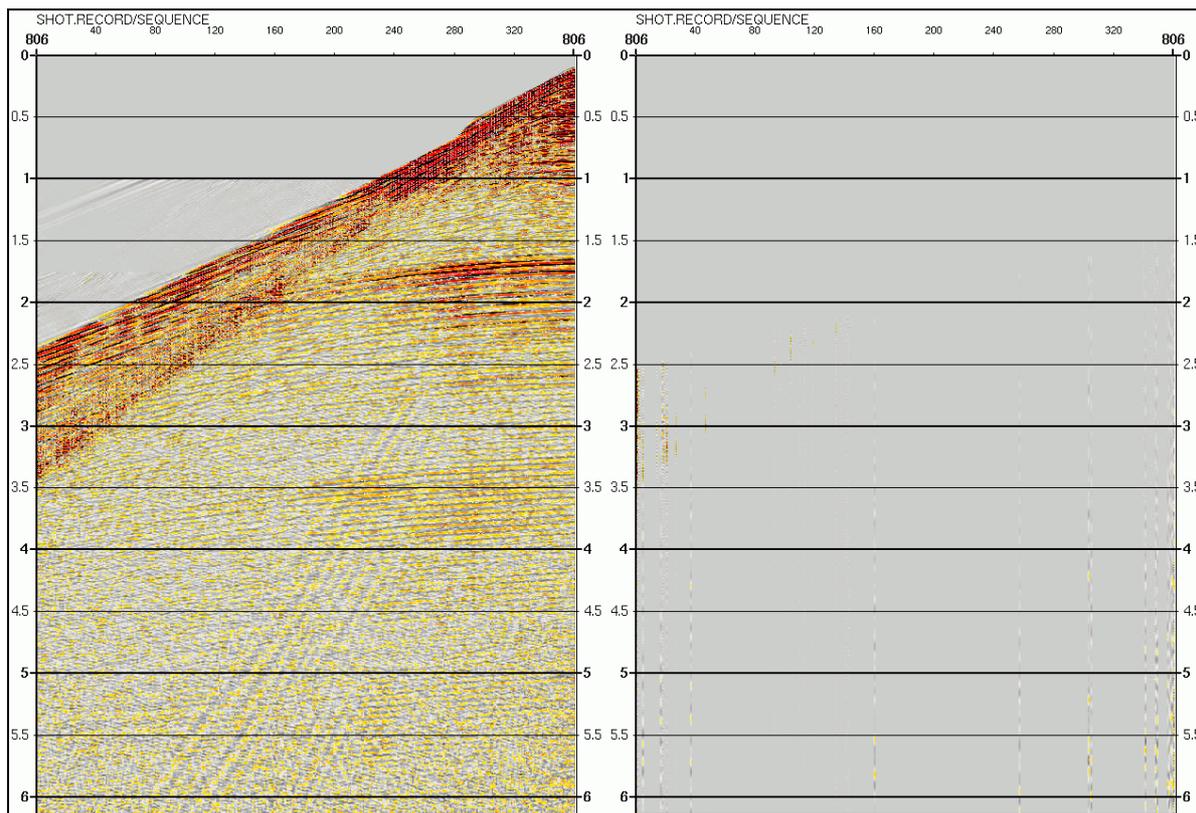

Figure 49: further random noise attenuation

3.5.9 TAU-P DECONVOLUTION

At this point, data are transformed into tau-p space and a 48 ms gap/300 ms deconvolution operator is applied. The operators are derived per p-value over varying p-ranges – Table 18 – and applied over the entire trace length as displayed in Figure 50.

	τ start	τ end
-400	1300	4200
0	1200	4000
400	1150	3000
700	1000	2000

Table 18: Operator derivation knee point in tau-p space

Before transforming the data back into regular x-t domain, a mute is applied as displayed in Figure 51.

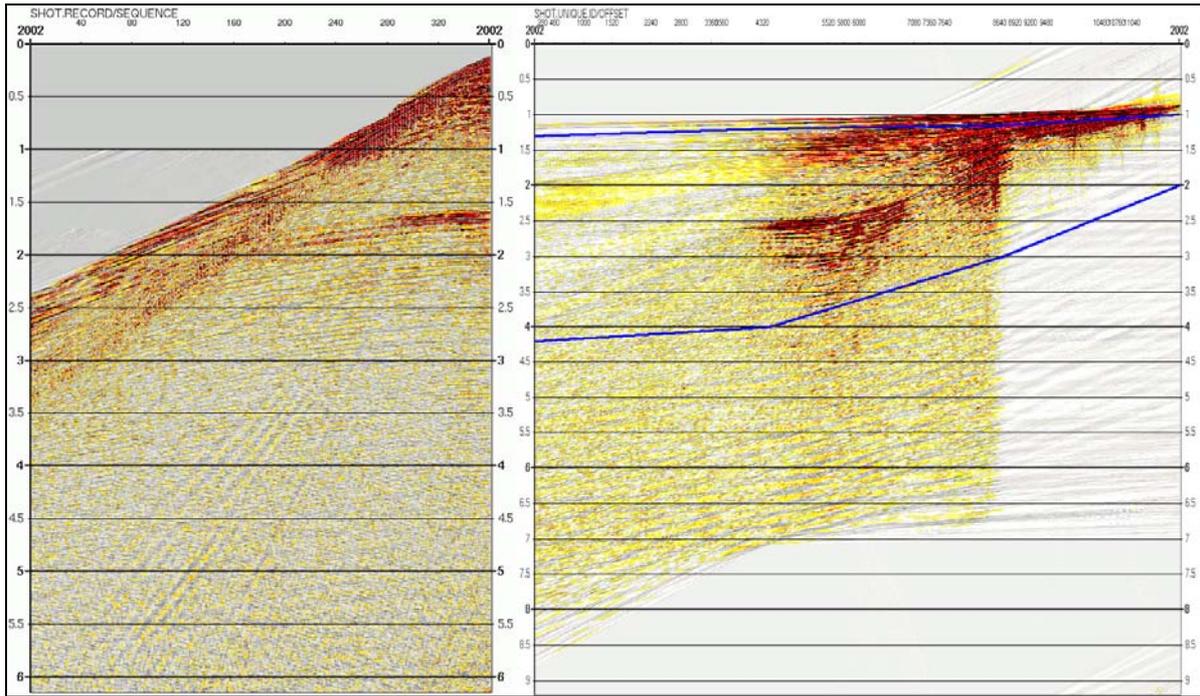

Figure 50: Input shotrecord and its tau-p representation with design window displayed

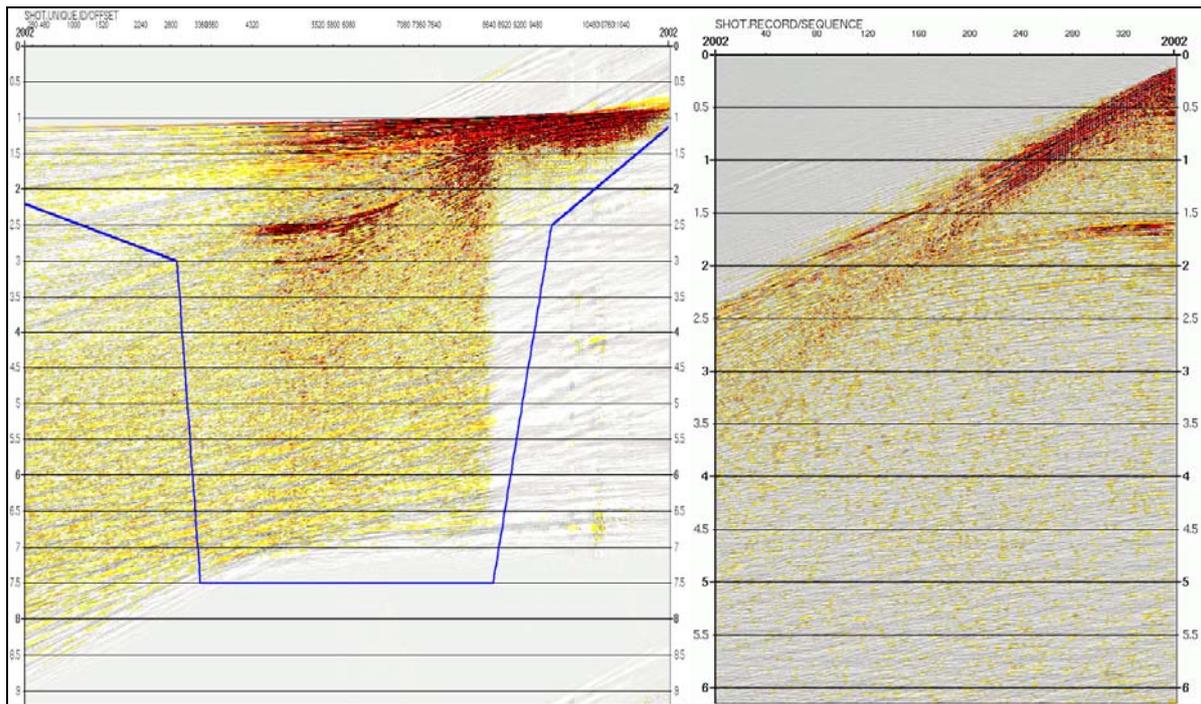

Figure 51: Shotrecord after tau-p deconvolution (mute pattern overlaid) and transform back to x-t domain

3.5.10 3D DATA LOADING

All data were loaded into 60 offset cubes, data were selected on one single criteria: in the case of 2 traces contributing to the same bin the one nearest the bin centre was kept, the other was discarded. Nominal offsets start from 150 m (centre of near offset plane) and

increment by 75 m to 4575 m. From this cube, sublines, crosslines and timeslices were extracted for 3D pre-stack quality control.

3.5.11 FINAL 3D STACK

The final step in the onboard processing sequence was to stack all data using the velocities from the 1 by 1 km grid (included in the Document Archive section of the CD-ROM) producing a 3D stack. Note that the fold in this stack is as acquired, but no areas are over 60 fold, no flex binning or crossline trace interpolation is applied. The final fold (Figure 52), sample crosslines (Figure 53), sublines (Figure 54) and timeslices (Figure 55) are displayed.

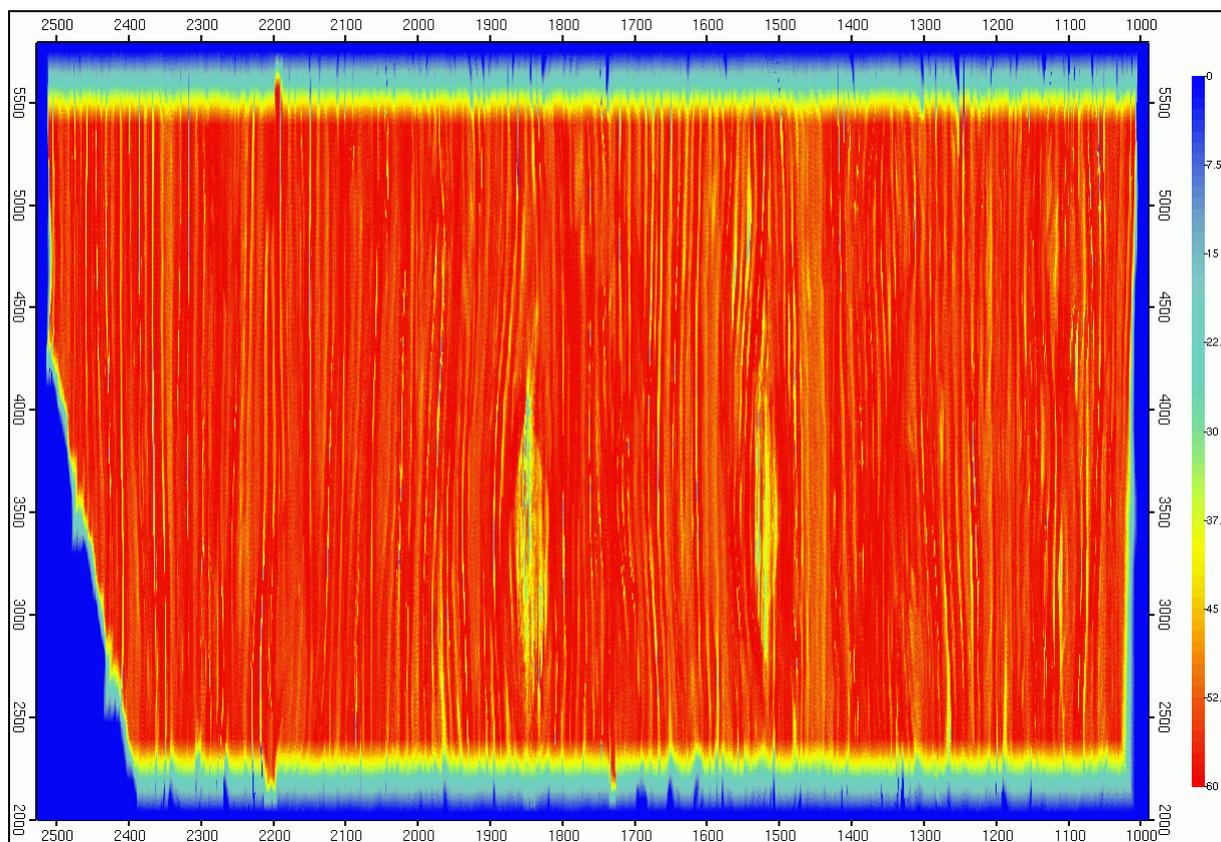

Figure 52: 3D quality control stack fold as-acquired

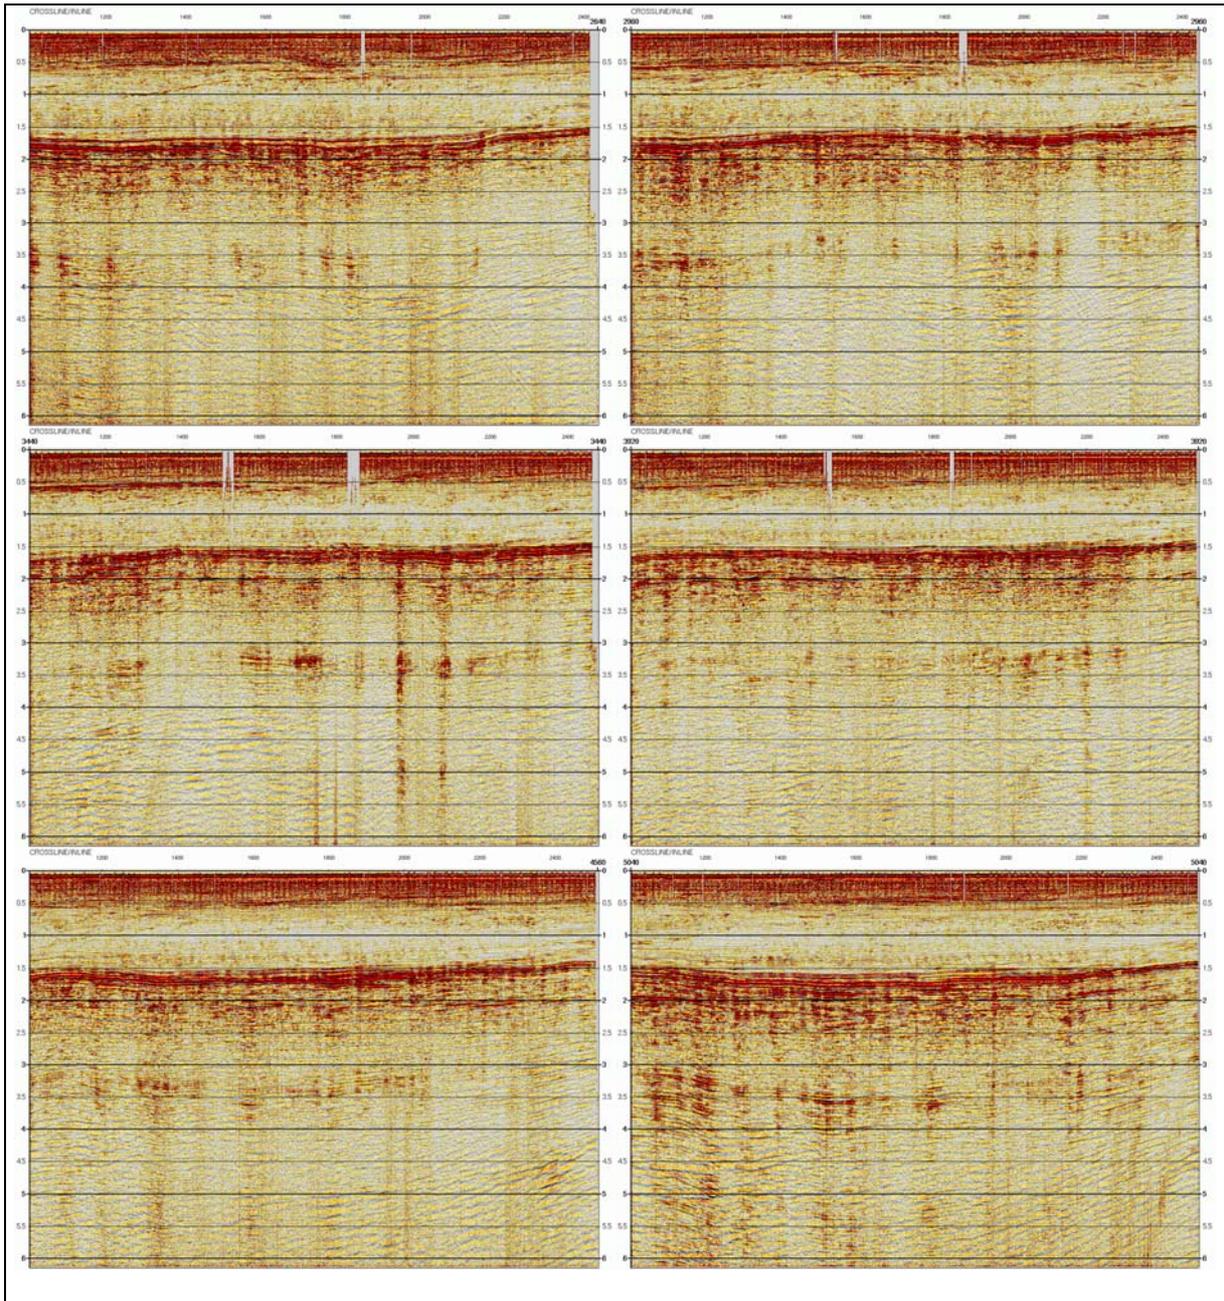

Figure 53: Example crosslines from 3D quality control stack (2640, 2960, 3440,3920, 4560 and 5040)

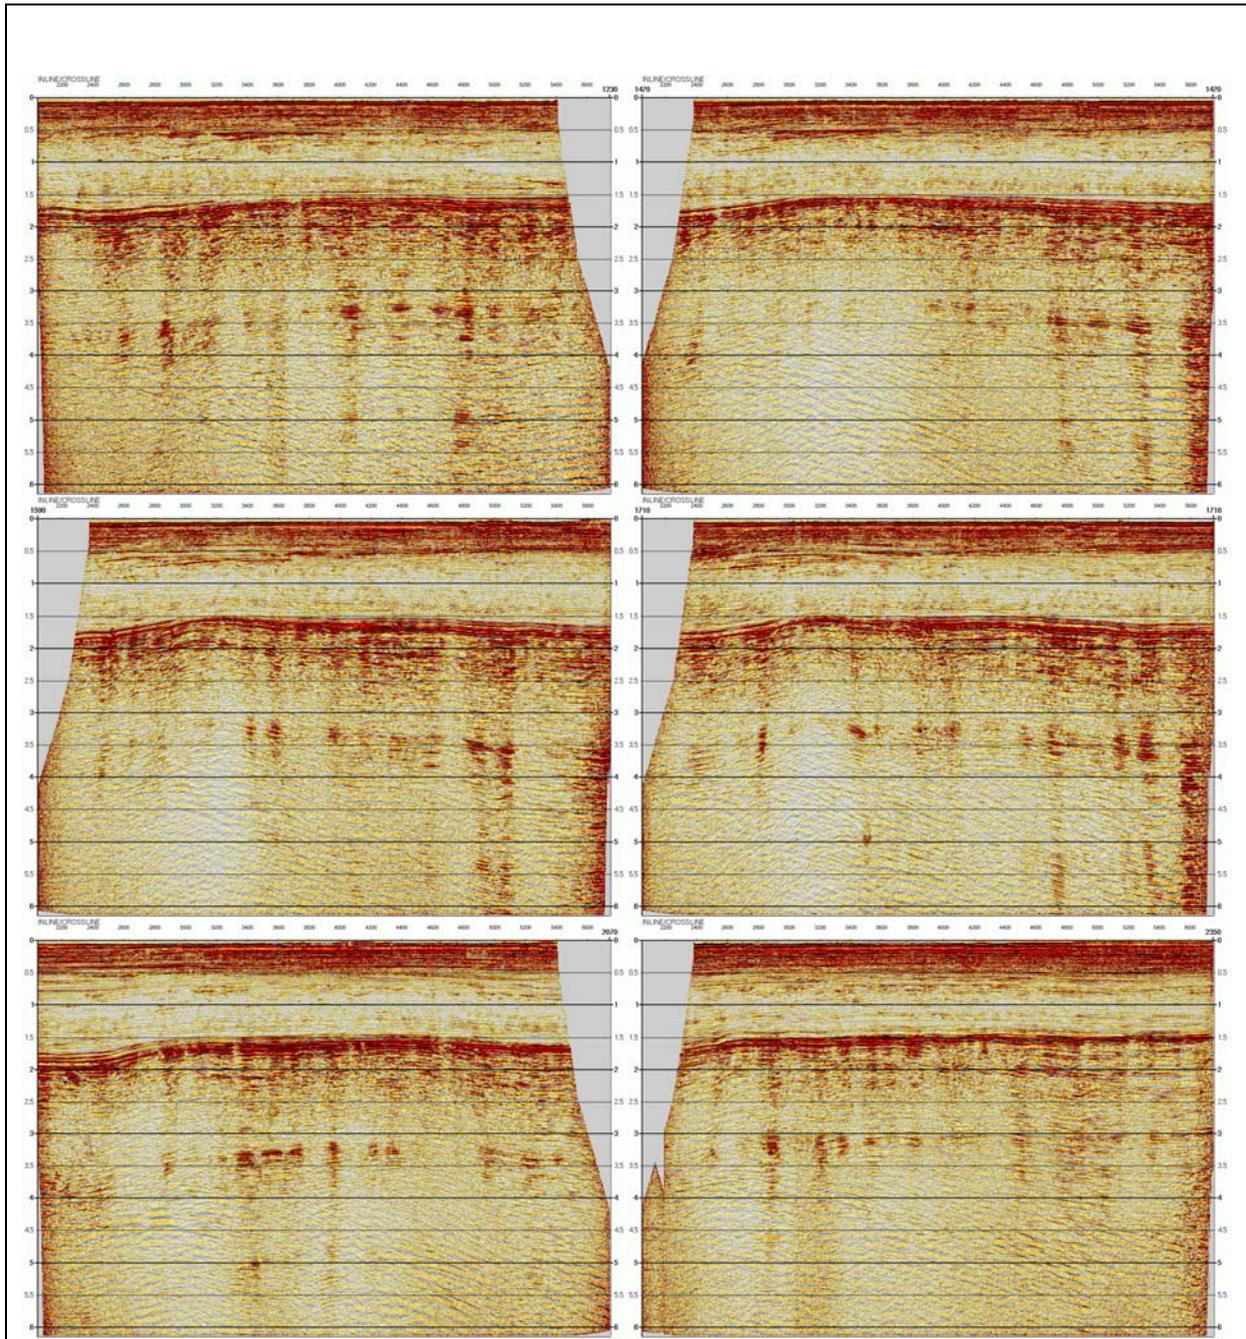

Figure 54: Example sublines from 3D quality control stack (1230, 1470, 1590, 1710, 2070 and 2350)

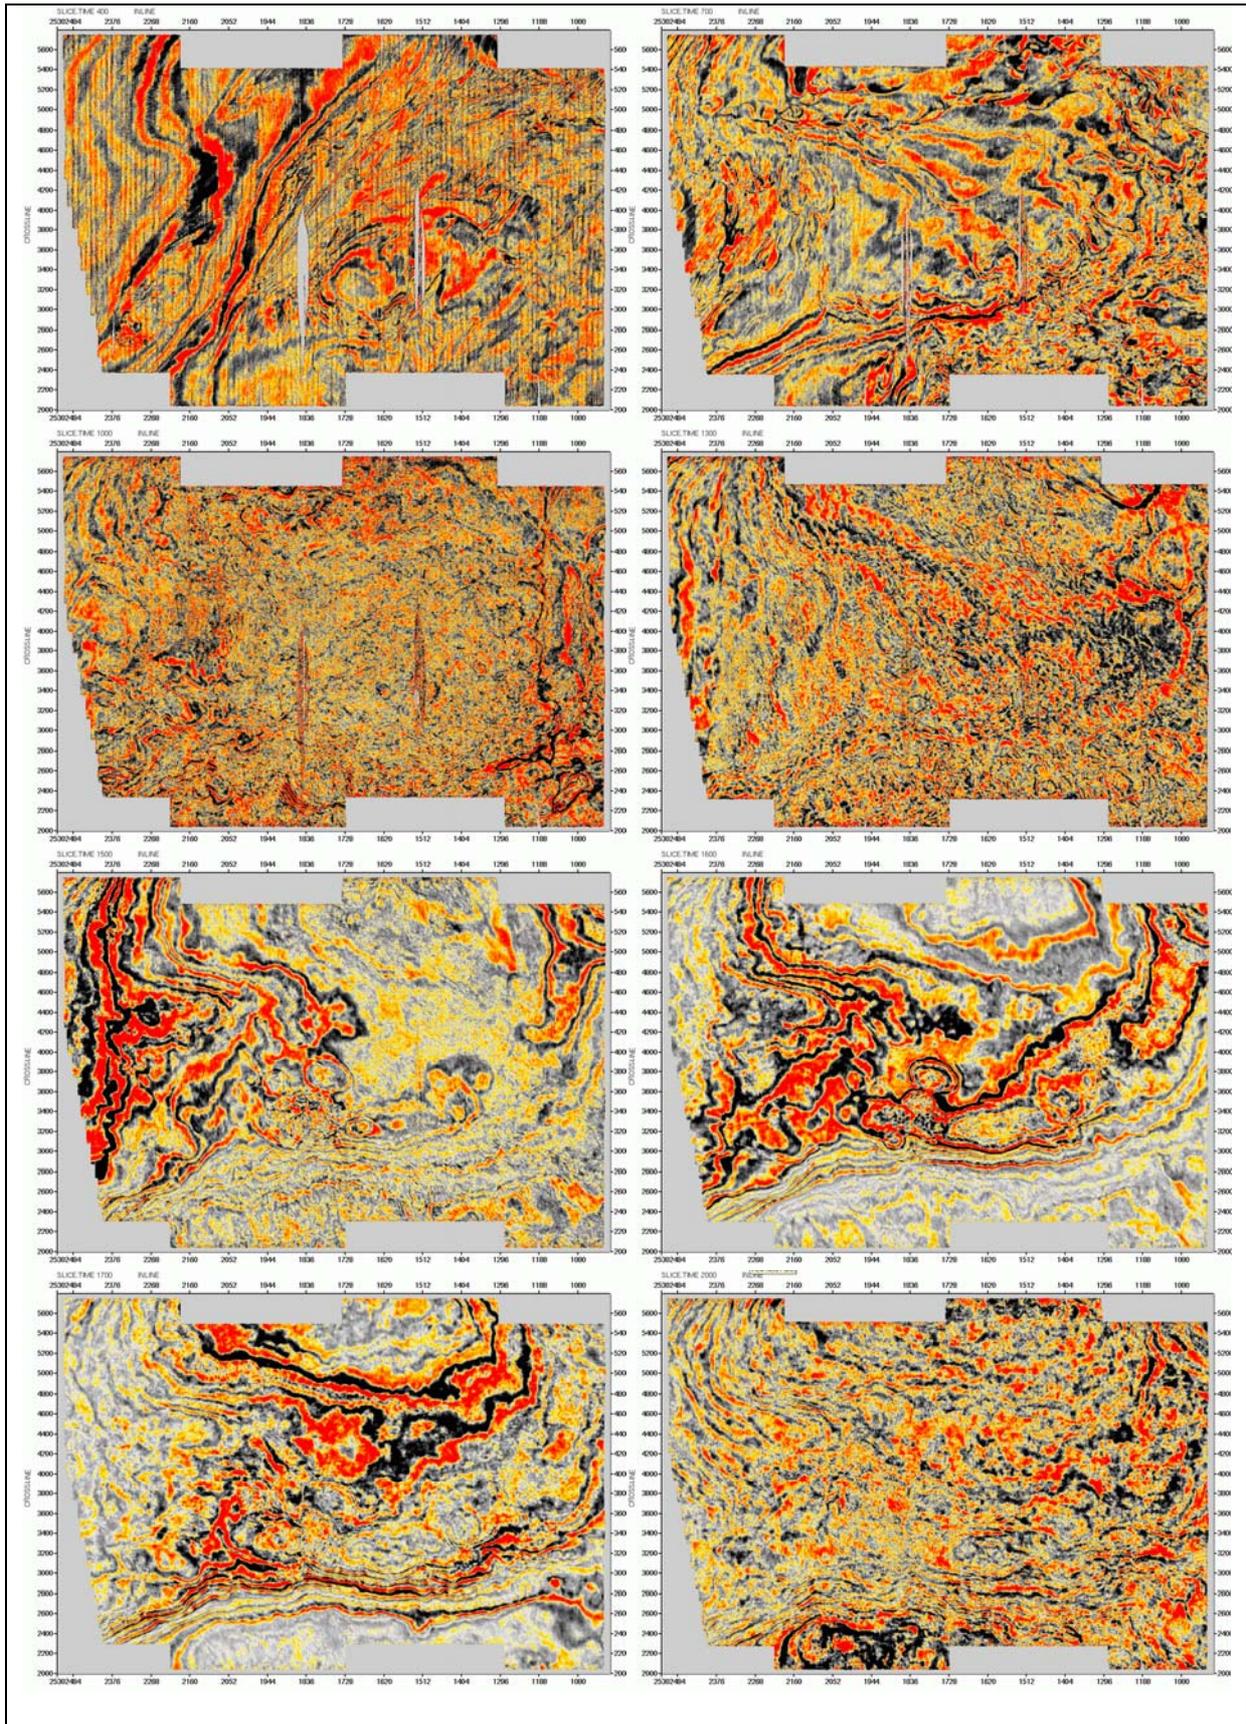

Figure 55: Example timeslices from 3D quality control stack (400, 700, 1000, 1300, 1500, 1600, 1700 and 2000)

4 CONCLUSIONS AND PERSONNEL

The Greater Bream 3D survey completed safely and successfully in occasionally testing conditions caused by local weather conditions. Production rates were steady between these weather interruptions and the data quality appears high and noise free. Technical downtime was above prediction at 15.5% of the Production period; however, for the given conditions this is not considered to be excessive although the majority of source related problems could have been avoided.

The main issue will be to ensure high quality velocity information, which will allow an effective multiple attenuation sequence to be implemented.

The second issue will be to ensure all remnant ambient noise and out-of-plane reflections caused by the presence of the platforms in the area is removed.

5 APPENDIX 1 SEG-Y AND DATA FORMAT DEFINITION

5.1 PURPOSE AND DESCRIPTION OF PROCESS

This document describes Buyer's minimum expectations for DATA FORMATS for processed seismic data, seismic derived velocity fields, seismic positioning data and associated derivatives intended for delivery to Buyer. This description is intended as the basis for the initial discussion between Buyer and Contractor.

5.2 OVERVIEW OF SEISMIC TRACE DATA FORMAT REQUIREMENTS

Unless Buyer agrees otherwise, all Seismic Trace Data delivered to Buyer shall be written in SEG-Y (Rev. 0, 1975) format, as defined by the Society of Exploration Geophysicists (SEG)¹.

The descriptions included herein of the information to be written to specific SEG-Y byte locations are a required minimum standard for all SEG-Y data delivered to Buyer. The number of headers, their length in bytes, and the length of all defined entries are expected to be consistent with the SEG-Y standard. Several Extended Header entries have been defined for both the dataset/volume and trace headers.

5.2.1 SYMBOLS USED IN HEADER DEFINITIONS

The following symbols are used in the descriptions of the required SEG-Y format.

Symbol	Description
.	Entry is optional but must contain valid value or proper fill per standard SEG-Y format.
rqd	Entry is required
aux	Entry is required, or may be provided in an Auxiliary Flat File
stat	If statics information is being provided, these entries must be filled or static values provided in an Auxiliary Flat File
@cdp	Enter the value at the CDP or 3D Bin location
avg	Enter the average value of all source-receivers for this CDP or 3D Bin
cond	Enter value only if it exists at the CDP or 3D Bin location. Otherwise enter zero ("0")
3d	Entry is required for 3D data
rbin	Entry is required for Binned Data
i16	16-bit integer number
i32	32-bit integer number

Symbol	Description
I2	2 byte integer number
I4	4 byte integer number
R4	4 byte IBM floating point number

5.2.2 OUTPUT MEDIA

Seismic trace data will be written to output media specified by Buyer. Output media may include magnetic tape, plug and play disk or data files for electronic transfer.

5.2.3 STANDARD SEG Y 3200 BYTE EBCDIC HEADER

The standard SEG Y 3200 byte EBCDIC header shall precede each data trace volume.

Contractor shall write standard information in the pre-defined byte locations of the SEG Y EBCDIC header in the format specified in Table 19.

Contractor shall write Buyer specified information in the optional byte locations of the SEG Y EBCDIC header in the format specified in Table 20 and in the following data type specific sections.

Card image number	Item Description	Byte Positions	Notes
C 2	Line (2D) or Survey (3D) name and Area Code	84 –160	See additional note in 5.2.4 below
C 5	Data traces per record	404-480	
C 6	Sample interval	484-540	
C 8	Byte order	601-640	Indicate whether byte order is Big or Little Endian. Note: Big-Endian is the only format acceptable to Buyer.
C21	Processing description	1604-1680	Brief processing description of data volume, i.e. Migrated Stack, RAP stack, CDP gathers with Decon.
C22	Processing description	1684-1760	Brief processing description (cont. from C21)
C23-26	Detailed processing description	1764-2080	Detailed processing flow, similar to film side label
C27	Shotpoint range / Sub-range for 2D or Inline/crossline range for 3D	2084-2160	Sub-ranges are to be used when a single 2D line (pre-stack) or 3D survey spans multiple physical output media.
C28	CDP range / Sub-range	2164-2240	Sub-ranges are to be used when a single 2D line (pre-stack) or 3D survey spans multiple physical output media.
C29	Processing Grid	2244-2320	X, Y's and inline/crossline numbers of 4 corner points.
C30-40	Reserved for processing specific information	2324-3200	Continuation of C23-C26. Include location and description of any trace header bytes that are not pre-defined elsewhere in this document.

5.2.4 NOTES ON CARD IMAGE C2: LINE (2D) OR SURVEY (3D) NAME AND AREA CODE.

The complete Buyer specified alphanumeric Line Name (for 2D data) or Survey Name (for 3D data) shall be written to card image C2 of the EBCDIC header. The Line Name shall not exceed 12 characters in length. The name shall be unique and allow unambiguous identification of the associated trace data.

The format of card image C2 in the EBCDIC Header will conform to the following:

- Columns 1-3 will be 'C 2'.
- The word 'LINE' will precede the Buyer alphanumeric line name with at least one blank space separating the word 'LINE' and the alphanumeric line name.

- The word 'AREA' will follow the alphanumeric line name separated by at least one space from the last character in the line name.
- The Buyer's designated Area Code will be located after the word 'AREA' separated by at least one space from the last character in the word area.

5.2.5 STANDARD SEG Y 400 BYTE BINARY HEADER

The standard SEG Y 400 byte binary header shall precede each data trace volume.

Contractor shall write standard information in the pre-defined byte locations of the SEG Y 400 byte binary header in the format specified in Table 21

Contractor shall write Buyer specified information in the optional byte locations of the SEG Y 400 byte binary header in the format specified in Table 22 and in the subsequent data type specific sections.

Table 21. Standard information written to the 400 byte SEG Y Binary Header

Description	Byte positions	Binary format	Pre-stack	Post-stack	Notes
Job Identification Number	3201-3204	i32	rqd	rqd	See additional notes below
Line Number	3205-3208	i32	rqd	rqd	See additional notes in below
Tape Reel Number	3209-3212	i32	rqd	rqd	See additional notes in below
No. of data traces per record	3213-3214	i16	.	.	The number of data traces per record including dummy traces and zero traces inserted to fill out the record or file. For stacked data, there is normally one data trace per record.
No. of Auxiliary traces per record	3215-3216	i16	.	.	
Sample interval in microseconds for this line	3217-3218	i16	rqd	rqd	Exception to standard SEG Y. The sample interval of the trace data for this line/survey only. The sample interval should be the same for all lines in a multi-line SEG Y volume. (The original standard specifies this parameter as sample interval in microseconds for this volume of data).
Sample interval in microseconds for original field recording of this line/survey.	3219-3220	i16	.	.	Original field recording sample interval. This value may change between lines on a multi-line SEG Y volume.
Number of samples per data trace for this line/survey.	3221-3222	i16	rqd	rqd	Exception to standard SEG Y. The number of samples per trace for this line only. The number of samples per trace should be the same for all lines in a multi-line SEG Y volume. (The original standard specifies this parameter as the number of samples per data trace for this volume of data).

Description	Byte positions	Binary format	Pre-stack	Post-stack	Notes
Number of samples per trace (Original)	3223-3224	i16	.	.	This value may change between lines on a multi-line SEGY volume.
Data sample format code	3225-3226	i16	rqd	rqd	Exception to standard SEGY. The only data format accepted by Buyer for SEGY data is: DATA SAMPLE FORMAT CODE 1 (one): IBM-floating point.
CDP / Bin fold	3227-3228	i16	.	.	Nominal CDP / Bin fold for the line or 3D survey.
Trace sorting code	3229-3230	i16	rqd	rqd	Exception to standard SEGY (This is a SEGY Rev 1.0 standard). 1 = shot ensemble 2 = CDP ensemble 3 = single fold continuous profile 4 = horizontally stacked 5 = Common source point 6 = Common receiver point 7 = Common offset point 8 = Common mid-point 9 = Common conversion point
Vertical sum code	3231-3232	i16	.	.	
Sweep frequency at start	3233-3234	i16	.	.	
Sweep frequency at end	3235-3236	i16	.	.	
Sweep length	3237-3238	i16	.	.	
Sweep type code	3239-3240	i16	.	.	
Trace No. of sweep channel	3241-3242	i16	.	.	
Sweep trace taper length (begin)	3243-3244	i16	.	.	
Sweep trace taper length (end)	3245-3246	i16	.	.	
Taper type	3247-3248	i16	.	.	
Correlated data traces?	3249-3250	i16	.	.	
Binary gain recovered?	3251-3252	i16	.	.	
Amplitude recovery method	3253-3254	i16	.	.	
Measurement system	3255-3256	i16	rqd	rqd	1 = Meters, 2 = Feet
Impulse signal	3257-3258	i16	.	.	
Vibrator polarity code	3259-3260	i16	.	.	

Table 22. Buyer specified optional information written to the 400 byte SEGY Binary Header

Description	Byte positions	Binary format	Pre-stack	Post-stack	Notes
Data type	3261-3262	i16	rqd	rqd	1 = Land2D, 2 = Marine2D, 3 = Land3D, 4 = Marine3D
Coordinate flag	3263-3264	i16	rqd	.	0 = No coordinate in trace headers 1 = Coordinates in trace headers

Description	Byte positions	Binary format	Pre-stack	Post-stack	Notes
Statics flag	3265-3266	i16	stat	.	0 = No statics in trace headers 1 = Statics in trace headers
CDP / Bin interval (3D primary direction)	3267-3268	i16	rbin	rqd	CDP interval for 2D; Grid Bin Interval for 3D (primary direction). In units of distance.
Scalar for CDP / Bin interval	3269-3270	i16	rbin	rqd	Scalar = $\pm 1, \pm 10, \pm 100 \dots$ +ve is a multiplier; -ve is a divisor. To be applied to values in bytes 3267-3268 and 3277-3278.
Datum elevation	3271-3272	i16	stat	stat	Datum elevation in distance units
Datum velocity	3273-3274	i16	stat	.	Datum velocity in distance units per second
Bulk static (msec)	3275-3276	i16	stat	.	Bulk static applied
Bin interval (3D secondary direction)	3277-3278	i16	3d	3d	Grid Bin interval (secondary direction). In units of distance.
SEG Y Format Revision Number	3501-3502	i16	rqd	rqd	Must = 0 (SEG Y Rev. 0)

JOB IDENTIFICATION NUMBER

The Job Identification Number (JIN) in bytes 3201-3204 (32-Bit Integer) shall be a unique number which allows Contractor to trace, tag or identify the seismic processing and acquisition sequences applied to the data for each line/survey. Each line/survey and process shall have a unique JIN.

In the case of this survey, the Job Identification Number was 'G06A'. Since the JIN contained ASCII characters, this value was stored as a hexadecimal number where ASCII code 'G' is 0x47, '0' is 0x30, '6' is 0x36 and 'A' is 0x41.

LINE NUMBER

The Line Number in bytes 3205-3208 (32-bit integer) shall be formed from the alphanumeric line name written to card image C2 of the EBCDIC volume header by removing the alpha characters from the name and concatenating the remaining numeric characters to give an integer number.

REEL NUMBERS

The reel number written in bytes 3209-3212 (32-bit integer) shall be unique numbers that can be referenced by the Contractor for invoicing purposes. The unique numbers shall

be documented in all transmittals, invoices and other shipping documents. The reel number for each line written to a multi-line physical output media shall be identical.

5.2.6 STANDARD SEGY 240 BYTE TRACE HEADER

The standard SEGY 240 byte binary Trace Header shall precede each data trace.

Contractor shall write standard information in the pre-defined byte locations of the SEGY 240 byte Trace Header in the format specified in Table 23

Contractor shall write Buyer specified information in the optional byte locations of the SEGY 240 byte Trace Header in the format specified in Table 24 and in the subsequent data type specific sections.

Table 23. Standard information written to the 240 byte SEGY Trace Header

Description			Pre-stack				Stack		Notes
			Not Binned		Binned		Binned		
	Byte position	Binary format	Land	Marine	Land	Marine	Land	Marine	
Trace sequence number within line	1-4	I4	rqd	rqd	rqd	rqd	rqd	rqd	See note in section 0
Trace sequence number within reel	5-8	I4	See note in section 0
Field Record identification number	9-12	I4	rqd	rqd	
Channel/Trace number within Field Record	13-16	I4	rqd	rqd	
Shot/Source Point identification number	17-20	I4	rqd	rqd	rqd	rqd	cond	cond	
CDP ensemble number	21-24	I4	.	.	rqd	rqd	rqd	rqd	
Trace number within CDP ensemble	25-28	I4	See note in section 0
Trace identification code	29-30	I2	rqd	rqd	rqd	rqd	rqd	rqd	1 = Live, 2 = Dead See note in section 0
Number of vertical summed traces	31-32	I2	
Number of horizontal summed traces	33-34	I2	
Data use flag	35-36	I2	1 = Production, 2 = Test
Source to receiver distance	37-40	I4	.	.	rqd	rqd	.	.	Signed distance

Description			Pre-stack				Stack		Notes
			Not Binned		Binned		Binned

3D Azimuth	229-232	R4	.	.	rqd	rqd	rqd	rqd	Source-Receiver azimuth in decimal degrees.

TRACE SEQUENTIAL LINE NUMBER

For single line output data sets, the trace sequential line number starts at 1 for the first trace of the output data set and increments by 1 for each trace output. For multi-line output data sets, the trace sequential line number is reset to 1 for the first trace output to each new line, and increments by 1 for each trace output in that line.

TRACE SEQUENTIAL REEL NUMBER

The trace sequential reel number is reset to 1 at the start of a new output volume and is incremented by 1 for each trace output to that volume.

TRACE NUMBER WITHIN CDP ENSEMBLE

The trace number within a CDP ensemble is reset to 1 at the start of each new ensemble and is incremented by 1 for each trace output to the ensemble.

TRACE IDENTIFICATION CODE

The trace identification codes are to be interpreted as follows:

A "1" means the data on trace is valid seismic data which is to be further processed.

A "2" means that data values on trace are invalid or corrupt (i.e., "bad"), or that all sample values have been set to zero.

A code "2" trace is to be treated as a "dead" or zero sample value trace for processing purposes. The trace is only written to preserve any valid information in the 240 byte trace header, and to preserve a uniform number of physical traces per record/ensemble. Any

invalid, or corrupt, trace header values should be corrected before writing the trace to tape.

Code "2" traces are typically removed from the processing stream after the Navigation-Seismic merge stage.

DOUBLE END-OF-FILE MARKS

Double end-of-file marks shall immediately follow the last trace of a contiguous seismic data volume.

5.2.7 CONCATENATED SEG Y SEISMIC DATASETS

MULTIPLE 2D POST-STACK DATASETS PER OUTPUT VOLUME.

The writing of multiple 2D post-stack datasets per output volume violates the SEG Y standard, but will be permitted by Buyer to reduce the number of physical output media required. The term 'dataset' in this context means a single 2D post-stack seismic line.

Unless otherwise agreed by Buyer, only one processing product is allowed per physical output media (e.g. Stack, Raw Migration, Final Migration, etc.).

Each dataset on the multi-dataset output shall be preceded by unique EBCDIC (3200 byte) and Binary (400-byte) headers.

A single EOF (end-of-file) marker shall terminate each dataset written. Two EOF markers shall immediately follow the last trace of the last dataset in the volume.

Continuation (splitting) of individual 2D datasets across physical output media shall not be allowed.

WRITING MULTIPLE 3D POST-STACK VOLUMES PER OUTPUT MEDIA.

The writing of multiple 3D post-stack volumes per output volume violates the SEG Y standard and is not permitted by Buyer. The term 'volume' in this context means a single 3D post-stack volume (e.g., a 3D DMO Stack or a 3D migration).

Unless otherwise agreed by Buyer, only one processing product is allowed per physical output media (e.g. Stack, Raw Migration, Final Migration, etc.).

Two EOF markers shall immediately follow the last trace of the 3D volume written.

Continuation (splitting) of a 3D volume across physical output media is permitted by Buyer, if this is dictated by the size of the volume and the capacity of the output media. Individual 3D in-lines (or cross-lines, if cross-line ordered) must not, however, be split across output sub-volumes. Each sub-volume written to each physical output media must have a correctly specified EBCDIC Header and a Binary Header as the first two file records.

PHYSICAL LAYOUT ON TAPE OR DISK FILE

One 3200 byte EBCDIC Header and one 400 byte Binary Header are required for each contiguous volume written to the physical output media. If an output volume spans more than one output media, the EBCDIC and Binary headers must be repeated for each such output.

For multi-line 2D volumes, each 2D line shall have a unique EBCDIC and Binary Header attached.

SEG Y SEISMIC TRACE DATA ENCODING FORMAT

The seismic trace data shall be in 32-bit binary IBM floating point (Big Endian). No other encoding format is acceptable to Buyer.

5.3 SEG Y FORMAT FOR SEISMIC NAV-MERGE FIELD DATA

This section describes Buyer's specific format for Seismic Field Data merged with Navigation/Positioning Data delivered as a Field Acquisition product. Table 25 lists specific requirements for this data type.

Table 25. Requirements for SEG Y Nav-Merge Field Data

Survey Type	Description	Requirement
All	Sample interval (Binary and Trace Headers)	Same as field recording sample rate
All	Trace sample values	Units are millivolts referred to the input of the acquisition system. If the sample values are not in units of millivolts, the actual engineering units used must be stated in the EBCDIC header.
All	Tidal corrections	The EBCDIC header should clearly state whether tidal corrections have been applied or not applied to depth measurements. If tidal corrections are applied, the calculation method must be stated.

Survey Type	Description	Requirement
All	Geodetic Datum	The EBCDIC header must state the geodetic datum used for the coordinates.
All	Source depth	Measured depths at 0.1 m resolution
All	Receiver depth	Measured depths at 0.1 m resolution
All	Source coordinates	All source coordinates measured at 0.1 m resolution
All	Receiver coordinates	All receiver coordinates measured at 0.1 m resolution
All	Channel sampling skew:	Skew removed from data traces or recorded in trace header. The EBCDIC header must state if channel skew has or has not been removed from the data traces.
All	System time delays	System delays removed from data traces or recorded in trace header. The EBCDIC header must state how system time delays are treated.
All	Not to be processed shots / bad shots	Not included in SEG Y data set
All	Reversed traces	Correct the trace in the SEG Y data set to the correct polarity
All	Dead and/or killed traces	Include the trace in the SEG Y data set and flag the trace status in 240 byte trace header, bytes 29-30
All	Sensor transduction constants:	Include in EBCDIC header with transduction units. Clearly state in the EBCDIC header the transduction factors to be used to convert the SEG Y sample values to units of microbars or meters per second.
All	SPS correspondence	All data traces must be traceable to an entry in a SPS data set
All	Data ordering	Shot order data files. The data files are sorted by common receiver type (i.e., Vertical geophone, inline geophone, crossline geophone, hydrophone) then by increasing channel number within a common sensor type then by cable/line number. All sensors from a given station must be contained within the data file.
OBC & Land	Trace identification	Each trace must be identified in its trace header as being a vertical geophone, an inline geophone, a crossline geophone or a hydrophone channel. The trace header location and the sensor type coding must be explained in the EBCDIC header.
OBC & Land	Horizontal geophone polarity	The polarity of the horizontal geophones must be stated in the EBCDIC header or be capable of being directly inferred from cable lay direction and shooting direction trace header entries.
All	Extra Binary and Trace header entries	All non-standard SEG Y Rev. 0 Binary Header and Trace Header entries must be explained in the EBCDIC header
All	Field recording parameters	The EBCDIC header must note the field production filters. If the field data has been filtered or gained in any way, the EBCDIC headers should note all pertinent processing parameters.

5.4 SEG Y FORMAT FOR MARINE STACKED DATA

This section describes Buyer's specific format for stacked marine data volumes.

5.4.1 400 BYTE BINARY HEADER

In addition to, or in place of, the information specified in section 5.2.5, Contractor shall write the information specified in Table 26 to the binary header.

Table 26. 400 byte SEG Y Binary Header for Marine Stacked Data

Description	Byte positions	Notes
Trace sorting code	3229-3230	4 = horizontally stacked
Data type	3261-3262	2 = Marine2D, 4 = Marine3D

5.4.2 SEG Y TRACE HEADERS

In addition to, or in place of, the information specified in section 5.2.6, Contractor shall write the information specified in Table 27 to the binary header.

Table 27. 240 byte SEG Y Trace Header for Marine Stacked Data

Description	Byte position	Notes
Shot/Source Point identification number at this CDP / Bin.	17-20	If source point ID exists at this CDP, enter it. Else enter zero.
Water depth at CDP / Bin.	61-64	If source point ID exists at this CDP, enter water depth at CDP. Else enter zero.
Source X-Coordinate at CDP / Bin.	73-76	If source point ID exists at this CDP, enter its X-Coordinate. Else enter zero.
Source Y-Coordinate at CDP / Bin	77-80	If source point ID exists at this CDP, enter its Y-Coordinate. Else enter zero.
Average Source-Receiver X-Coordinate at CDP / Bin	81-84	Enter the average value of source-receiver X-Coordinates for all traces in this CDP / Bin
Average Source-Receiver Y-Coordinate at CDP / Bin	85-88	Enter the average value of source-receiver Y-Coordinates for all traces in this CDP / Bin
Water Velocity at CDP / Bin	91-92	If source point ID exists at this CDP, enter water velocity at CDP / Bin. Else enter zero.

5.5 SEG Y FORMAT FOR LAND STACKED DATA

This section describes Buyer's specific format for stacked land data volumes.

5.5.1 400 BYTE BINARY HEADER

In addition to, or in place of, the information specified in section 5.2.5, Contractor shall write the information specified in Table 28 to the binary header.

Table 28. 400 byte SEG Y Binary Header for Land Stacked Data

Description	Byte positions	Notes
Trace sorting code	3229-3230	4 = horizontally stacked
Data type	3261-3262	1 = Land2D, 3 = Land3D
Coordinate Info Flag	3263-3264	Must = 1

5.5.2 SEG Y TRACE HEADERS

In addition, to or in place of, the information specified in section 5.2.6, Contractor shall write the information specified in Table 29 to the binary header.

Table 29. 240 byte SEG Y Trace Header for Land Stacked Data

Description	Byte position	Notes
Shot/Source Point identification number at this CDP / Bin.	17-20	If source point ID exists at this CDP, enter it. Else enter zero.
Average Source-Receiver elevation at CDP / Bin	41-44	Enter the average value of source-receiver elevations for all traces in this CDP / Bin
Source surface elevation at CDP / Bin	45-48	If source point ID exists at this CDP, enter its elevation. Else enter zero.
Source depth at CDP / Bin	49-52	If source point ID exists at this CDP, enter its depth. Else enter zero.
Source X-Coordinate at CDP / Bin	73-76	If source point ID exists at this CDP, enter its X-Coordinate. Else enter zero.
Source Y-Coordinate at CDP / Bin	77-80	If source point ID exists at this CDP, enter its Y-Coordinate. Else enter zero.
Average Source-Receiver X-Coordinate at CDP / Bin	81-84	Enter the average value of source-receiver X-Coordinates for all traces in this CDP / Bin
Average Source-Receiver Y-Coordinate at CDP / Bin	85-88	Enter the average value of source-receiver Y-Coordinates for all traces in this CDP / Bin
Source Uphole Time (msec) at CDP / Bin	95-96	If source point ID exists at this CDP, enter its Uphole Time. Else enter zero.
Receiver Station Number	181-184	If a Receiver Station Number exists at this CDP, enter it. Else enter zero.

5.6 SEG Y FORMAT FOR MARINE PRE-STACK DATA

This section describes Buyer's specific format for marine pre-stack data volumes.

5.6.1 400 BYTE BINARY HEADER

In addition to, or in place of, the information specified in section 5.2.5, Contractor shall write the information specified in Table 30 to the binary header.

Table 30. 400 byte SEG Y Binary Header for Marine Pre-Stack Data

Description	Byte positions	Notes
Trace sorting code	3229-3230	1 = shot ensemble 2 = CDP ensemble 3 = single fold continuous profile 5 = Common source point 6 = Common receiver point 7 = Common offset point 8 = Common mid-point 9 = Common conversion point
Data type	3261-3262	2 = Marine2D, 4 = Marine3D

5.6.2 SEG Y TRACE HEADERS

In addition to, or in place of, the information specified in section 5.2.6, Contractor shall write the information specified in Table 31 to the binary header.

Table 31. 240 byte SEG Y Trace Header for Marine Pre-Stack Data

Description	Byte position	Notes
Field Record identification number	9-12	Enter Field Record Number associated with this trace. Used to merge XY info. (Not required for binned data)
Channel/Trace number within Field Record	13-16	Enter Field Channel or Trace Sequence Number for this Field Record. Used to merge XY info. (Not required for binned data)
Shot/Source Point identification number.	17-20	Enter Source Point Identification Number for this Field Record.
Source to receiver distance	37-40	Enter signed source to receiver distance. NOTE: Sign is negative if opposite to direction line shot. (Required for binned data).
Receiver surface elevation	41-44	Enter surface elevation at receiver for this trace.
Source surface elevation	45-48	Enter surface elevation at source point for this trace.
Source depth	49-52	Enter source depth for this source point.
Water depth at Source	61-64	Enter water depth at this source point.
Water Velocity	91-92	Enter water velocity for this trace.
Source Line Number	189-192	For un-binned data, enter 3D survey sail line number.

5.7 SEG Y FORMAT FOR LAND PRE-STACK DATA

This section describes Buyer's specific format for land pre-stack data volumes.

5.7.1 400 BYTE BINARY HEADER

In addition to, or in place of, the information specified in section 5.2.5, Contractor shall write the information specified in Table 32 to the binary header.

Table 32. 400 byte SEG Y Binary Header for Land Pre-Stack Data

Description	Byte positions	Notes
Trace sorting code	3229-3230	1 = shot ensemble 2 = CDP ensemble 3 = single fold continuous profile 5 = Common source point 6 = Common receiver point 7 = Common offset point 8 = Common mid-point 9 = Common conversion point
Data type	3261-3262	1 = Land2D, 3 = Land3D

5.7.2 SEG Y TRACE HEADERS

In addition to, or in place of, the information specified in section 5.2.6, Contractor shall write the information specified in Table 33 to the binary header.

Table 33. 240 byte SEG Y Trace Header for Land Pre-Stack Data

Description	Byte position	Notes
Field Record identification number	9-12	Enter Field Record Number associated with this trace. Used to merge XY info. (Not required for binned data)
Channel/Trace number within Field Record	13-16	Enter Field Channel or Trace Sequence Number for this Field Record. Used to merge XY info. (Not required for binned data)
Shot/Source Point identification number.	17-20	Enter Source Point Identification Number for this Field Record.
Source to receiver distance	37-40	Enter signed source to receiver distance. NOTE: Sign is negative if opposite to direction line shot. (Required for binned data).
Receiver surface elevation	41-44	Enter surface elevation at receiver for this trace.
Source surface elevation	45-48	Enter surface elevation at source point for this trace.
Source depth	49-52	Enter source depth for this source point.
Weathering Velocity (V1)	91-92	Enter weathering velocity for this trace. Units consistent with Binary Header (feet or meters)
Sub-weathering Velocity (V2)	92-94	Enter sub-weathering velocity for this trace. Units consistent with Binary Header.

Description	Byte position	Notes
Source static correction	99-100	Enter one-way time (msec) from Source Depth to Datum Elevation (Binary Header bytes 3271-3272). This is a surface consistent static derived from elevation statics, refraction statics, surface consistent statics or any combination of these.
Receiver static correction	101-102	Enter one-way time (msec) from Receiver Elevation to Datum Elevation (Binary Header bytes 3271-3272). This is a surface consistent static derived from elevation statics, refraction statics, surface consistent statics or any combination of these.
Total static applied	103-104	Enter sum of all statics that have been applied to this trace. I.e., surface consistent + residual + trim statics.
Receiver Station Number	181-184	Receiver Station Number associated with this trace.
Receiver Line Number	185-188	Enter 3D survey receiver line number (un-binned 3D data only)
Source Line Number	189-192	Enter 3D survey source line number (un-binned 3D data only)
Trace residual static (msec)	197-200	Enter non-surface consistent static (two-way time in msec) for this trace. This entry represents all statics whose origin cannot be traced back to either the source or receiver, e.g., correlation (trim) statics for a CDP gather.

5.8 VELOCITY DATA FORMATS

Velocity Data formats are to be agreed by Contractor and Buyer on a project specific basis. More than one format and/or output media may be required for each velocity field to be written.

5.9 POSITIONING DATA FORMATS

Refer to Technical Standard PS-09-04 for Positioning Data Format specifications.

5.10 REFERENCES AND DOCUMENTATION.

PROJECT PARAMETER SUMMARY

Esso Australia Pty Ltd.
20323 Bream 3D MSS
Veritas Viking II

GENERAL SURVEY PARAMETERS

Survey Definition

Client name (for ALL tapes/logs etc)	Esso Australia Pty. Ltd.
Survey name	2006 Greater Bream 3D MSS
Survey location	Gippsland Basin, Bass Strait, Australia
Veritas job number	20323
Shotpoint interval	18.75 m (37.5m per energy source)
Line orientation	10.5/190.5

Streamer

Number of streamers	8
Streamer active length	4500 m
Streamer type	Thales Guardian Twinax Solid Streamer
Streamer separation	75 m +/- 7.5 m (overall 525 m +/- 18.75 m)
Number of groups per streamer	360
Group length	12.5 m
Streamer depth	7 m +/- 0.5 m
Inline offset	50-100 m
Depth controllers	DigiCOURSE Model 5011 spaced < 300 m

Recording Parameters

Record length	6 seconds (6144 ms recorded)
Sampling rate	2 ms
Low cut filter	3(12) Hz (dB/oct)
High cut filter	206(276) Hz (dB/oct)
Qc analysis display low-cut filter	5(18) Hz (dB/oct)
Recording format	SEGD-8036 (24-bit integer)
Recording media	3590 data cartridge
Fold of data	60
Auxiliary traces	12 (11 near-field + 1 combined near-field/time break)
Recording time delay	0

Energy source

Source type	Bolt 1500LL & Bolt 1900LLXT
Number of sources	2
Source array depth	6 m +/- 0.5 m
Source length	16.5 m
Gun synchronization	+/- 1.0 ms
Nominal air pressure	2000 psi (minimum 1900 psi)
Volume	4450 cu in
Undershoot vessel gun volume	4550 cu in single source.
Source centre-centre separation	37.5 m +/- 3.75 m
Sub-array separation	8 m +/- 1.5 m
Number of sub-arrays	3

PROJECT PARAMETER SUMMARY

Esso Australia Pty Ltd.
20323 Bream 3D MSS
Veritas Viking II

Navigation

Primary Navigation System	Veripos Ultra
Secondary Navigation System	Veripos Standard
Tertiary Navigation System	C-Nav
Steering Position Layback	CMP (inline midpoint between guns and first-group)
Run out shot points to achieve full-fold	120 (does NOT include the 5 shots for navigation processing)
Shooting Mode	Dual source flip-flop
Undershoot Shooting Mode	Single source (2 passes of each line required)
SOL run in	6750 m (1.5 x streamer length)
Offset zones	4 (bin scale MUST display actual hits per bin, not percentages)

Positioning Parameters - Acquisition

Acquisition Datum	WGS84
Spheroid	WGS84
Semi-Major Axis	6378137.000
Inverse Flattening	298.257223563
Projection	UTM
Zone	55S
Origin Latitude	0°00'00" N
Central Meridian	147°00'00 E
False Easting	500000
False Northing	10000000
Scale factor at Central Meridian	0.99960

Positioning parameters - Processing

Processed Datum	WGS84
Processed Spheroid	WGS84
Semi-Major Axis	6378137.000
Inverse Flattening	298.257223563
Projection	UTM
Zone	55S
Origin Latitude	0°00'00" N
Central Meridian	147°00'00 E
False Easting	500000
False Northing	10000000
Scale factor at Central Meridian	0.99960

Geodetic Datum Shift Parameters

Shift Direction	N/A – Acquisition and processing datum is the same
X Offset	0
Y Offset	0
Z Offset	0
X Rotation	0
Y Rotation	0
Z Rotation	0
Scale Difference	0

Survey Area and Bin Grid Parameters

3D sail kilometres	Full-Fold: 1718.83125 km	With Run-Outs: 1939.331 km
2D well-tie sail kilometres	Full-Fold: 59.08125 km	With Run-Outs: 65.83125 km
Total sail kilometres	Full-Fold: 1777.91250 km	With Run-Outs: 1998.41250 km
Total CMP Kilometres (inc 2D lines as 3D)	Full-Fold: 28446.60000 km	With Run-Outs: 31974.60000 km
Full-fold square kilometres (3D only)	Full-Fold: 515.649375 km ²	
Number of 3D pre-plot sail lines	95	
Number of 2D well-tie sail lines	3	
Sail line numbering	1008 – 2512 (incr. 16)	

PROJECT PARAMETER SUMMARY

Esso Australia Pty Ltd.
20323 Bream 3D MSS
Veritas Viking II

2D well-tie lines	Line 1 – Line 2 – Line 3
Average Sail line length	18.07 km
CMP Lines	1001 – 2520
CMP Lines per Sail Line	16
Sail Line Separation	300 metres
CMP Line Separation	18.75 m
Geometry Bin size (inline x crossline)	6.25 m x 18.75 m
Reflex Database Bin size (inline x crossline)	18.75 m x 18.75 m
Map Grid Origin easting / northing	536607.43 / 5733310.28
Map Grid Bearing of J-axis	10.5°
Bin Grid Origin/Increment/Extent I axis	3408 / -1 / 46875 m
Bin Grid Origin/Increment/Extent J axis	801 / 1 / 26175 m
Shot Grid Origin/Increment I axis	3408 / -1
Shot Grid Origin/ Increment J axis	801 / 1
Bin Dimensions (I x J)	18.75 x 18.75 m
Offset Distribution	150 to 4650 Step 75 metres

Binning Offset Zones

Note: 70 m inline offset → 150 metres for start of zone 1 to ensure coverage on nears

Description	Actual offset range	Max Fold	Zone ID	Required percentage	Hits
Zone 1	150 – 1275	15	1	90	14 (13.5)
Zone 2	1275 – 2400	15	2	80	12 (12.0)
Zone 3	2400 – 3515	15	3	70	11 (10.5)
Zone 4	3515 – 4650	15	4	60	9 (9.0)
All	150– 4650	60	All	75	45 (45.0)

Inline offset Source to Centre Near Group Offset	70 m
---	------

Flexible Binning Parameters – for Infill Allocation

Offset	Flex	Bin Width
Near	50%	37.5 m
Far	100%	56.25 m

Steering

Priority	Instruction
1	Steer zone 1 and 2 paying attention to zone 3 and 4

Conventions

Item	Convention
Line names	Format: XXXX-NNNNTA-SSS XX: Esso Identifier (G06A) NNNN: Line name T: Type (P for Prime, F for Infill, U for Undershoot, R for Reshoot) A: Attempt 1- 9 SSS: Sequence Number (3 digits)
Shotpoint Numbering	Direction 1°: 1001 Up (max 2117) Direction 2°: Down to 881 Notes: The last shotpoint LSP/LPSP will include 120 runouts but line will have an additional 5 EOL nav processing shotpoints. For reshoots, need 10 overlap 'A' shotpoints before and after each reshoot segment
File Numbering	Ambient Noise SOL: 99-110 Warm-Up: 111-120 First Shot to Last: 121-n Nav Proc Shots: n+1 to n+5 Ambient Noise EOL: n+6 to n+10 (NOTE: 5 noise records at EOL)

PROJECT PARAMETER SUMMARY

Esso Australia Pty Ltd.

Veritas Viking II

Field Tape Numbering	First Tape of Survey: 1001 Notes: All daily tests to be recorded to tape (original and copy), assigned the next consecutive tape number and included in the shipments.
Time Zones	Acquisition Time Zone: All acquisition log times will be reported in UTC (UTC is Local +10:00 hours).

Infill and Reshoots

Line Type	Information
Progressive infill	Infill will be acquired progressively after a number of successive prime line passes. As a guide, a progressive infill line should be acquired when the offline distance from the next sail-line is likely to average close to 300 metres (16 CMP lines)
Infill	Infill holes will be picked up once the prime is completed
Incomplete prime	In general, partial prime holes will be picked up once the prime is completed. Due to short average line length, no circling will be done. For any problem that will take more than 15 minutes to repair, the problem is to be fixed during transit/line change to next line.
Reshoot	At client's discretion, any line may be re-acquired near survey end

SPECIFICATIONS AND TOLERANCES

Acquisition Specifications

Specification	Tolerance/spec
Line Segments	
Minimum Line Segment	• 5 km minimum – max 1 reshoot per 12 km line length
Maximum number of line segments	• 3 segments per pre-plot sail line
Bad Shotpoints	
Bad Shots Definition	<ul style="list-style-type: none"> • Autofire/Misfire/No-fire • Shots acquired during air-leaks • Source arrays separation outside 33.75-41.25 m • Any sub-arrays distance outside 6.5-10.5 m • Shot point interval outside 16.25-21.25 m • Any source depth outside 5.5-6.5 m • Delta error: greater than +/- 1.0 ms • Navigation errors (NAVS/NAVL etc) • Gun controller out-of-spec • Any header problems • Any streamer depth outside 5.5-8.5 m • Front end streamer-streamer separation outside range 67.5-82.5 m • Total separation on front end outside range 506.25-543.75 • No data recorded (NDR) – usually a missed shot point • Streamer extraction (> 96) / parity errors (>1152), telemetry errors • Any record for which not all data can be recovered • More than 4 dB difference in group sensitivity • More than 2 bad traces for any 600 m segment • More than 14 bad traces for any streamer in spread • More than 57 bad traces for all streamers in spread
Bad Shots Allowed	<ul style="list-style-type: none"> • Max. 2% of total shots on line (i.e. max 22 bad shots for normal line) • Max. 8 consecutive or 6 consecutive from same source • Max. 12 in any 20 • Max. 20 in any 100
Streamers	

PROJECT PARAMETER SUMMARY

Esso Australia Pty Ltd.

Daily Events Log

Survey Name: Greater Bream 3D 2006

Dates: 4/22/2006 to 7/13/2006

This report shows the daily comments made for each vessel on the survey.

Date	Comments
Vessel	SR/V Veritas Viking2
4/22/2006	Alongside Fremantle Port, berth # 11. Continue to take on supplies. Carry out repairs on equipment. Complete Gyro/GPS calibration. HSE start up meeting held onboard. 0800 Pilot onboard 0830 V2 away from Port 0855 Pilot departs. Underway to Bass Strait. ETA is April ~ 28.
4/23/2006	Continue travelling to the Bream survey area. Technical audit being carried out during the transit.
4/24/2006	Continue travelling to the Bream survey area. Technical audit being carried out during the transit. New gun umbilicals in place.
4/25/2006	Continue travelling to the Bream survey area. Technical audit being carried out during the transit. EDN Behavioural Training completed.
4/26/2006	Continue travelling to the Bream survey area. Technical audit being carried out during the transit.
4/27/2006	Continue travelling to the Bream survey area. Technical audit being carried out during the transit. 1200 Safety Meeting 1235 Bridge carrying out "Black out" drill
4/28/2006	Continue travelling to the Bream survey area. Technical audit being carried out during the transit. 0145 Toolbox meeting for Helo Operation. 0347 Helicopter on deck with Esso Pilot to inspect the helio deck 0351 Helicopter away. Inspection begins. 0431 Helicopter on deck. Inspection complete."All good" 0437 Helicopter away. Wayne Forrest, Simon Mustoe and Alan Tan Depart.

Date	Comments
------	----------

Vessel	SR/V Veritas Viking2
--------	----------------------

Bring V2 to all stop to lower ADP and to carry out TS Dip 39°22.5 S and 147°06.3 E.
0437 Lady Roula on sight.
0523 start calibration of ADP
0555 Calibration complete
0652 Deploy tailbuoy 1 Working on ballast
0847 Deploy tailbuoy 8. Will be checking streamer 8 for leakage on bird line.
1410 Streamer 1 deployed off the back of the V2 to check ballast.
1447 logging data on strm 1 for ballast issues.
1500 recover strm 8 to re ballast bird 8
1611 deploy strm 8
1649 Stop logging data to for Strm 1
1652 turning port
1820 turn complete. Continue to trouble shoot leakage problem on Strm 8
1902 logging bird data for Strm 1
2000 Wx NE F3 / 1.5 mtr
2108 stop logging depth data on Strm 1
2258 coming on S1 to ballast front end
2345 Toolbox meeting held for Workboat operation.
2348 deploy Strm 1
2400 Continue to deploy strm 1 and 8. Working on bird communication problem on strm 8.

4/29/2006

Continue to deploy streamers 1 and 8 at start of day.
0008 Workboat deployed to work on ballast on strm 1
0035 WB working on ballast around bird 4
0039 WB moving to bird 8
0042 stop deploying strm 8 due to distance between the strm's
0046 WB ballasting around bird 8 strm 1
0048 Port vane deployed
0051 WB moving to bird 12
0058 WB ballasting around bird 12
0100 going out on Strm 1 and port van
0103 WB complete ballasting. Enroute to V2
0112 deploy streamer 8
0117 WB onboard. Start port turn. Strm 1 and port vane in position.
0260 Trouble shooting bird com problem on stream 8
0409 deploy tailbuoy 1
0559 working on ballast on strm 2
0752 working on bird com problem Strm 8
1014 Toolbox meeting held prior to deployment of headfloat strm 8
1034 Toolbox meeting held prior to deployment of stbd vane
1036 deploy stbd vane
1052 Strm 8 and vane deployed start turn
to 250° Continue to deploy strm 2.
1248 turn complete. Toolbox for launch of Tailbuoy 7
1249 TB 7 launched
1655 install GPS tap can at head of Strm 2.
1700 WX SSW F4 / 1.5 m swell
1722 Install new PMI rods and delta plates on Strm 2.
1953 coming on strm 1 and vane to attach strm 2.
2006 going out on strm 1-2 and vane. Continue to deploy strm 7
2038 Recover strm 7 to replace bad section.
2229 Toolbox meeting held prior to deployment of tailbuoy 3 WX SE F4 / 2m sea.
2235 deploy TB 3
2400 at end of day strm's 1-2 and 8 are fully deployed and Strm 3 and 7 are being deployed.

4/30/2006

Date	Comments
------	----------

Vessel	SR/V Veritas Viking2
--------	----------------------

Continue to deploy streamers at start of day. Streamers 1-2 and 8 are fully deployed. Strm 3 and 7 going out.
 Continue technical audit.
 0245 Fire drill
 0300 secure from drill.
 0330 Strm 7 fully deployed. Continue out on Strm 3
 0730 install Tap can in strm 3
 1203 add head float to strm 3
 1207 bring strm 1-2 and vane in to attach strm 3.
 1227 going out with strm 1-3 and vane
 1250 Strm 1-3 in position
 1255 Stopped over strm 7 in order to recover strm 8 due to heavy area around bird 12.
 1300 Coming in on Strm 8 and vane
 1328 Vane onboard
 1454 Deploy strm 8
 1555 toolbox meeting held prior to launch of stbd vane.
 1557 deploy stbd vane
 1601 deploy vane and strm 8.
 1707 going out on strm 7-8 and vane
 1722 Strm 7-8 in position
 1725 recover Strm 3 to work on front acoustic pod. Wx SE F4 / 2 mtr seas
 1812 replace collars on head acoustic pod Strm 3.
 1819 deploy strm 3.
 1900 Strm 1-3 in position
 1906 deploy Tailbuoy 6
 2027 continue to deploy strm 6. Wx SE F5 / 2 mtr seas
 2400 continue to deploy strm 6 at end of day. Streamer 6 out to front acoustic net

5/1/2006

Continue to deploy streamers. Strm 1-3 and 7-8 fully deployed. Strm 6 being deployed.
 0009 Coming in on Strm 7-8 to attach strm 6 tag line.
 0030 deploy strm 6-8
 0120 strm 6-8 in position turn to CMG of 070* to run test on streamers.
 0410 Streamers in line start running test on ballast and noise files. Strm's brought up to 7 mtr shooting depth
 0448 Wx ESE F4 / 1.5 mtr
 0800 finish collecting data. Streamers taken down to 14 mtrs
 0815 Toolbox meeting held prior to recover of all streamers due to approaching storm. Forecast is for 6-9 mtr seas with 35 kt winds.

Down for weather. Forecast is for weather to increase. Winds to become 30-35 kts and sea to build to 9 mtrs on the second.
 Begin recovery of Stbd streamers, 6-8
 0901 Coming in on Strm 6 move strm 7-8 out of way.
 0934 come in on strm 1-3.
 1033 begin recovery of strm 3. Move strm 1-2 out of way
 1211 come in on strm 7-8
 1233 Begin recovery of streamer 7. Move strm 8 out of way
 1344 Tailbuoy 6 onboard
 1421 Tailbuoy 3 onboard
 1423 come in on strm 1-2
 1501 begin recovery of strm 2. strm 1 moved off out of way
 1604 Tailbuoy 7 onboard
 1609 coming in on strm 8 and vane
 1615 Toolbox meeting held prior to recovery of vane
 1628 Stbd vane onboard. Continue to recover strm 8
 1719 Tailbuoy 2 onboard. Recover strm 1 and vane
 1724 toolbox meeting held prior to recovery of port vane
 1727 port vane onboard. Continue to recover strm 1
 1855 Tailbuoy 8 onboard.
 1915 Toolbox meeting held prior to recovery of ADP Pole.
 1920 ADP pole up and secured.
 1956 Tailbuoy 1 onboard. V2 enroute to prospect are to carry out gun test.
 2130 MMO started 90 m pre-start whale watch

2310 arrived in survey area. Vessel speed slowed to 4 kts
 2400 will deploy one gun string at a time in order to complete gun signature test.

5/2/2006

Date	Comments
------	----------

Vessel	SR/V Veritas Viking2
--------	----------------------

In survey area carrying out gun signature test. Whale watch carried out during gun test.
0057 Stbd inner guns deployed
0138 Chase Vessel "Lady Roula" released to goto port due to approaching bad weather.
0208 Test fire guns individually.
0309 stop test due to no Nav header information going to ARGUS
0430 Bridge testing Bow and Stern thrusters.
0440 test complete on thrusters.
0538 Test 1 Stbd outboard guns
0605 stop test. Recover guns. Deploy Stbd mid guns
0656 guns deployed.
0732 recover stbd mid to repair transducer.
0751 Test stbd Mid guns
0830 Gun tes complete recover guns. Deploy stbd inner guns
0915 Guns deployed
1037 test complete. Recover stbd inner.
Deploy port inner
1109 Start test on port innere guns
1305 Test complete Recover port inner guns and deploy port outer guns.
1503 start test of port outer guns.
1534 test complete. Recover guns WX NW F5/ 1.5 m sea
1548 deploy port mid guns.
1600 guns in position.
1629 Testing Port mid guns
1701 Test completed

Down for weather WNW F7 2m
1754 trouble shoot problem between Nav and Argus
1833 guns onboard. WX WNW F7/2m sea.
1834 enroute e to "Bad Weather Loitering Zone" (Closer to shore line)
2015 Wx WNW F7 / 2.5 m seas
2400 WX WNW F6 / 2.5 m seas
Survey area expecting seas to increase to 6-9 mtr.

5/3/2006

Down for weather. Riding in sheltered area. Wx WNW F6 / 2.5-3 m seas
0430 Wx W F7 / 3m sea
0715 Wx SW F8 / 2.5-3m sea
1100 Wx WNW F8 / 3.5-4 m sea
1312 Wx W F7 / 3.5-4 m sea
1715 Wx W F6 / 2.5 m sea
2145 Wx WNW F3 / 2m sea
2217 Bring vessel to all stop to deploy ADP pinger. Prepare to deploy streamers.
2242 Come around to a heading of 238* ADP deployed
2253 Start logging data for ADP cal, File hd238jd123,
2300 complete logging. Trun vessel ta heading of 058*
2310 start logging data for ADP cal, file hd58jd123
2327 deploy Tailbuoy 1. Complete logging
2400 deploying streamer 1 at end of day.
Wx WNW F3 / 2m seas. Deployment is in the Loitering Zone

5/4/2006

Date	Comments
Vessel	SR/V Veritas Viking2
	<p>Weather down time. Continue to deploy streamers after being down for weather. Strm 1 being deployed at start of day. 0041 toolbox meeting to launch tailbuoy 8 00042 Tailbuoy launched 0215 Toolbox meeting covering Helo duties. 0304 Helicopter onboard. Two MMO's onboard. 0310 Helicopter away, Ted Clark and Nathan Waugh off 0340 toolbox meeting held prior to launch of vane. 0344 deploy port vane. Going out with Vane and strm 1 0400 Stop on port vane and strm 1 0403 Toolbox meeting held prior to deployment of tailbuoy 2 0405 Deploy tailbuoy 2 0503 all stop on deploying strm 2 due to separation between Strm 2 and 8 0510 Continue deployment of Strm 2 0609 change out section on strm 8 0652 deploy strm 2 and 8 0743 Toolbox meeting held prior to launching head float Strm 8 0745 head float launched 0749 Toolbox meeting held prior to launch of stbd vane 0751 deploy stbd vane. Going out on vane and strm 8 0759 Pleasure boat approaching tail of streamers. Would not answer radio's. Several flares and spot light shined in the direction of the vessel. V2 halted turn to stbd and came back to port so as not to turn in front of vessel. Vessel travelling at 13 knots. 0819 V2 speed brought down to 3.5 kts to allow the Vessel to over take quicker. 0838 deploy strm 2. 0859 toolbox meeting held prior to deployment of tailbuoy 7 0901 Tailbuoy 7 deployed 0937 start turn 1058 Strm 2 coming to surface. Strm 7 Suspect fishing debris 1110 recover strm 2 to bird 10 to remove fishing gear. 1126 Stop coming in on strm 2. Tail end of strm 7 diving deep and being pulled closer to strm 2. Suspect fishing debris caught between the two streamers. 1134 Strm 2 and 7 back to depth. Debris seems to have come off. Continue to recover Strm 2 to bird 10 to inspect area. 1247 Strm 2 up to bird 10. All looks okay. 1254 deploy streamer 2 and 7. 1438 install tap can on strm 2. continue out on strm 7. 1515 Toolbox meeting held for deployment of headfloat strm 2. 1530 deploy head float 1540 come in on strm 1 and vane to attach strm 2. 1600 deploy strm 1-2 and vane. 1616 stop on strm 1-2 and vane. 1628 Have to recover Streamer 7 due to section failing capacity test. Are of failure is area of suspected fishing gear was hung up. 1629 toolbox meeting held prior to launching tailbuoy 3. 1630 deploy tailbuoy 3 1718 hold up on deploy strm 3 until strm 7 passes by to keep from tangling streamers. 1758 strm 7 picked back up to section 8 Trouble shoot section. 1804 section 8 changed out. suspect damage done by fishing debris. 1849 deploy streamer 7. 1908 deploy strm 3 2018 coming in on strm 7 due to noisy channels. suspect debris on section 2034 hold up on strm 3 due to close proximity of strm 7. 2105 strm 7 up to bird 14. nothing obvious. Changed out section 2148 deploy strm 7 2215 deploy strm 3 2237 install tap can on strm 7 2245 toolbox meeting held prior to deployment of headfloat. 2300 Tapcan installed. head float deployed. come in on strm 8 and vane 2334 stop on strm 7-8 and vane 2340 Toolbox meeting held prior to deployment of tailbuoy 6 2344 deploy tailbuoy 6 2400 install tapcan on strm 3. At end of day Streamers 1-2 and 7-8 fully deployed. Streamer 3 to go out on vane and streamer 6 being deployed</p>

5/5/2006

Date	Comments
------	----------

Vessel	SR/V Veritas Viking2
--------	----------------------

Down for wether.Weather down time. Continue to deploy streamers after being down for weather. Streamers 1-2 and 7-8 fully deployed. Deploying streamers in Loitering zone. Installing tapcan on Strm 3 and deploying strm 6 at start of day.

0016 change out tail stretch on Strm 6
0018 toolbox meeting carried out for launching headfloat on Strm 3.
0020 headfloat launched
0026 come in on Strm 1-2 to attach strm 3.
0035 deploy strm 1-3 and vane
0052 all stop on strm 1-3
0115 deploy strm 6
0133 run ballast test on strm 1-3 and 7-8. Strm brought up to 7m
0145 log ballast data to file
0235 stop logging data
0423 stop deploying due to problem with strm 6 reel.
0441 deploy strm 6
0453 toolbox meeting to launch tailbuoy 4
0455 deploy tailbuoy 4
0522 install tap can on strm 6
0548 toolbox meeting to launch headfloat 6
0555 headfloat launched. Comms good
0557 come in on stbd vane and strm 7-8 to attach strm 6
0611 deploy strm 6-8 and stbd vane
0634 stop on strm 6-8 and vane

Change over to Deployment. Streamer 1-3 and 6-8 fully deployed after weather down time. Continue to deploy strm 4.

0830 ETA Lady Roula 2 hours. Wx SSW F5 / 1m
0920 turn V2 due to fishing gear in path.
1012 Lady Roula on site.
1309 Wx SSW F5 1.5 m seas
1445 Problem with reel for strm 4

Hydraulic problem with streamer reel for strm 4. Trouble shoot problem.

Continue to deploy streamer 4.

1808 toolbox meeting held prior to deployment of tailbuoy 5.
1812 tailbuoy 5 deployed
1828 Strm 4 in position. Strm's 1-4 and 6-8 brought to 7m depth to check ballast.
2114 continue to deploy strm 5. Starting angling towards prospect.
2158 Pre-start Whale watch started.
2233 toolbox meeting held prior to launch of headfloat # 5
2237 headfloat deployed.
2310 strm 5 fully deployed.
2326 make adjustment to front end alignments.
2315 toolbox meeting held prior to launch of workboat.
2335 Stbd workboat launched to carry out ballasting on streamers.
2400 making adjustment to head of streamers 4-5 and working on ballast issues via workboat.

5/6/2006

All streamers fully deployed. Workboat launched working on ballast issues with the streamers.

0000 Strm 6 Birds 2, 3, 8, 14 ballasted. 0056 Strm 7 birds 9 and 17
1118 Strm 8 bird 16
0128 Strm 2 bird 12, 15 and 17. Making adjustments to front ends of strm 4-5.
0201 finish adjustment to strm 4-5
0206 Workboat onboard.
0231 adjustment made to separations on streamers logging noise data and bird data.
0251 toolbox meeting held to deploy guns
0254 deploy guns
0330 Voyager on location. Taking new fuel hose from Lady Roula
0415 Stbd guns in position
0437 Lady Roula departs for shore.
0445 deploy port guns
0557 Port guns in position

Make adjustment to separations with all gear fully deployed. Carry out noise test on streamers. Warm guns up to carry out guns test. Drop test, hydrophone pulse test.
0716 start firing guns one at a time for hydrophone test. Continue to make adjustment to spread.
0900 preform shut down test. All instruments powered off and restarted to insure header information will stay the same.
0956 toolbox meeting carried out for recovery of guns and streamer 6
1000 Problem with Drop test on guns and bad traces have come up on strm 6.

Date	Comments

 2324 stbd vane deployed.
 2339 stop deployment to gain separation between strm 7 and 8
 2400 Separation good coming in on strm 7 to attach tag line. Wx WNW F8 / 3 m seas.

5/8/2006

Continue Bream 3D pre-survey testing and calibration at start of day. WX = W F7, 3.0 m combined sea and swell. All times in UTC.

0001 hrs: Streamer 7 attached to stbd PV and going wide.
 0028 hrs: Recover port streamer geometry to tow position.
 0048 hrs: Tailbuoy 6 away. Deploy streamer 6.
 0117 hrs: Replace section 5 on streamer 6 (leakage pulsing).
 0318 hrs: Reduce vessel speed to improve PRH for Helo operations.
 0425 hrs: Helicopter 1 on deck for split seismic crew change.
 0430 hrs: Helicopter 1 away.
 0445 hrs: Helicopter 2 on deck.
 0456 hrs: Helicopter 2 away.
 0458 hrs: Helicopter 3 on deck.
 0505 hrs: Helicopter 3 away.
 0508 hrs: Helicopter 3 back on deck for missing Australian maritime crew member. See IR V2-IR-06-OSVV6PL9JV.
 0511 hrs: Helicopter 3 away. Crew change complete. McNelly's rotation off/ Grizaard's rotation on.
 0520 hrs: Replace section 12 on streamer 6 (leakage pulsing).
 0927 hrs: Streamer 6 attached to stbd PV and going wide.
 0935 hrs: Commence 90 minute pre-soft start cetacean monitoring.
 1025 hrs: Deploy source arrays.
 1038 hrs: Streamers in tow position.
 1108 hrs: Source arrays in tow position.

 1125 hrs: Commence source array pressure verification (all 6 sub-arrays).
 1128 hrs: Fine tune streamer geometry separations.
 1143 hrs: Adjusting source array in-line and cross-line separations.
 1243 hrs: Commence source array soft start for individual station pressure verification.
 1501 hrs: Recover source arrays. Stbd centre sub-array failed pressure verification at 1 station. Port inboard sub-array failed pressure verification at 1 station.

 1503 hrs: Streamer 1 out of specification. Adjacent channels 316-313 noisy/ leakage pulsing. Make preparations to recover.
 1547 hrs: Streamer 6 hard telemetry failure at first passive module. Commence troubleshooting.
 1603 hrs: Source arrays onboard and secure.
 1722 hrs: Streamer 4 stacked over streamer 7.
 1743 hrs: Streamer 3 stacked over streamer 6.
 1754 hrs: Streamer 2 stacked over streamer 5.
 1801 hrs: Port PV onboard and secure.
 1806 hrs: Recover streamer 1 to active section 27.
 1937 hrs: Replace active section 27 on streamer 1. Channel range proves good.
 2147 hrs: Deploy port PV and streamer 1.
 2200 hrs: Streamer 6 RVIM thought to be the cause of telemetry failure.
 2246 hrs: Streamer 2 connected to port PV and going wide.
 2332 hrs: Streamer 3 connected to port PV and going wide.
 Deploying streamers 1, 2, 3 and 4 at end of day. WX = NW F6, 2.0 m combined sea and swell.

5/9/2006

Date	Comments
Vessel	SR/V Veritas Viking2

Continue Bream 3D pre-survey testing and calibration. WX = NW F7, 3.0 m combined sea and swell. All times in UTC.

0032 hrs: Streamers 1, 2, 3 and 4 in tow position. Make preparations to recover streamer 6 due to hard telemetry failure at passive module 2.
0110 hrs: Streamer 5 stacked over streamer 2. Recover streamer 6.
0148 hrs: Streamer 6 passive configuration onboard. Commence troubleshooting.
0239 hrs: TAP module found to be at fault. TAP module replaced. Run tests.
0245 hrs: Emergency muster and abandon ship drill.
0315 hrs: Streamer 6 telemetry proves good.
0317 hrs: Drill stood down.
0325 hrs: Streamer 1 active module 27 failure.
0442 hrs: Streamer 6 connected to stbd PV and going wide.
0505 hrs: Streamers 8, 7, 6 and 5 in tow position. Make preparations to recover streamer 1 due to active module 27 failure.
0614 hrs: Streamer 4 stacked over streamer 7.
0708 hrs: Streamer 3 stacked over streamer 6.
0738 hrs: Streamer 2 stacked over streamer 5. Recover port PV and streamer 1.
0751 hrs: Port PV onboard and secure. Recover streamer 1 to active module 27.
0817 hrs: Chase/ support vessel 'OMS Voyager' reports stbd engine failure.
0906 hrs: OMS Voyager heading for sheltered waters to make repairs.
0913 hrs: Replace active module 27. Run tests.
0930 hrs: Telemetry proves good. Deploy streamer 1.
1020 hrs: Replace active section 29 on streamer 1 (noisy channels).
1025 hrs: Deploy port PV and streamer 1.
1128 hrs: OMS Voyager off station heading for Corner Inlet for stbd drive train repairs.
1225 hrs: Streamer 2 connected to port PV and going wide.
1231 hrs: Commence stbd turn back towards the program area.
1417 hrs: Streamer 3 connected to port PV and going wide.
1532 hrs: Streamer 4 connected to port PV and going wide.
1612 hrs: All streamers in tow position.
1654 hrs: Deploy source arrays. WX = WSW F7, 3.0 m.

Weather standby. WX = WSW F8, 3.0 m combined sea and swell. Wind gusting to 50 kts.

1706 hrs: Halt deploying source arrays due to adverse wind and sea conditions.
1714 hrs: Recover source arrays.
1723 hrs: Source arrays onboard and secure.
1725 hrs: Vessel heading to 'adverse weather loitering area' for shelter. Streamers in tow position (target depth 20 m).
1900 hrs: WX = W F8, 4.0-5.0 m combined sea and swell.
2100 hrs: WX = W F7, 4.0 m combined sea and swell.
2200 hrs: WX = WSW F5, 3.0 m combined sea and swell.
2255 hrs: Weather improving, vessel turning back towards program area.

Vessel heading for program area at end of day. WX = WSW F5, 3.0 m combined sea and swell.

5/10/2006

Weather standby. WX = WSW F7, 3.0 m combined sea and swell. Vessel heading to program area at start of day. All times in UTC.

0135 hrs: Deploy source arrays.
0215 hrs: Commence 90 minute pre-soft start cetacean monitoring.
0218 hrs: Source arrays in tow position.
0411 hrs: Crossed into acoustic boundary. Commence source array soft start and cetacean monitoring.
0431 hrs: Source arrays at full volume.
0455 hrs: Commence test line to confirm header transfer and instrument integrity.
0524 hrs: Test line complete. All systems good.
0535 hrs: Commence port source array pressure drop verification.
0550 hrs: Port source array pass.
0555 hrs: Commence stbd source array pressure drop verification.
0610 hrs: Stbd source array pass.
0612 hrs: Recover source arrays to adjust separation tethers.
0642 hrs: Deploy source arrays.
0715 hrs: Source arrays in tow position.
0717 hrs: Run pre-survey instrument tests.
0758 hrs: Commence source array soft start and cetacean monitoring.
0818 hrs: Source arrays at full volume.

 1506 hrs: Streamer 6 connected to port PV and going wide.
 1602 hrs: Streamer 5 connected to port PV and going wide.
 1628 hrs: Port geometry in tow position.
 1635 hrs: All streamers in tow position. Vessel heading for progressive infill sequence 012.
 1712 hrs: Deploy source arrays.
 1720 hrs: Raise streamers to target depth for noise analysis.
 1830 hrs: WX = 230° at 11 m/s, 2.0 m combined sea and swell.
 1835 hrs: Source arrays in tow position.
 2020 hrs: Commence source array soft start and cetacean monitoring.
 2040 hrs: Source arrays at full volume.
 2043 hrs: Abort attempt at progressive infill sequence 012 due to excessive swell noise. WX = 230° at 9 m/s, 2.0 m combined sea and swell. Continue down sail line to attempt partial prime hole.
 2140 hrs: Commence source array soft start and cetacean monitoring.
 2200 hrs: Source arrays at full volume.

Run-in Alpha SPs. 1399A-1390A.

Record 1744P2, sequence 012, >191°, 16 CMP prime, volume: 4450/ 4450.
 FPSP: 1389/ LPSP: 1239.
 Partial prime reshoot of sequence 005 due to air pressure out specification.
 Line complete.

Wx: 266° at 10 m/s, 2.0 m combined sea and swell.

Run-out Alpha SPs. 1238A-1229A.

Line change technical.

Vessel heading for progressive infill sequence 013 at end of day.

5/14/2006

Date	Comments
Vessel	SR/V Veritas Viking2
	<p>On approach to progressive infill sequence 013 at start of day.</p> <p>0135 hrs: Commence source array soft start and cetacean monitoring. 0155 hrs: Source arrays at full volume. 0207 hrs: Azimuth thruster locked down and engaged.</p> <p>Record 1488F1, sequence 013, >011°, progressive infill, volume: 4450/ 4450. FPSP: 1001/ LPSP: 2117. Line complete.</p> <p>0248 hrs: Vessel passing 705 m clear of Bream 'B'. 0330 hrs: Azimuth thruster up and secure. 0353 hrs: Stbd workboat away for personnel transfer with Pacific Sword. 0422 hrs: Workboat onboard and secure. Shirley, La Bouve and Morris onboard.</p> <p>Wx: 070° at 10 m/s, 1.0 m combined sea and swell.</p> <p>Line change infill.</p> <p>0503 hrs: Stbd workboat away for streamer maintenance. Replace active section 2 in streamer 6. 0627 hrs: Workboat successfully replaced active section 2. Heading back to vessel. 0645 hrs: Commence source array soft start and cetacean monitoring. 0656 hrs: Stbd workboat onboard and secure. 0705 hrs: Source arrays at full volume.</p> <p>Record 1776F2, sequence 014, >191°, progressive infill, volume: 4450/ 4450. Vessel	SR/V Veritas Viking2
--------	----------------------

2236 hrs: Streamer 4 stacked over streamer 7.
 2241 hrs: Conduct tow drill exercise with 'Marimba'.
 2254 hrs: Drill stood down.
 2325 hrs: Streamer 3 stacked over streamer 6.
 2342 hrs: Streamer 2 stacked over streamer 5.
 2351 hrs: Port PV onboard and secure. Increase tether length by 10 m.

Vessel on course 030° for PV recovery at end of day.

5/15/2006

Vessel on course 030° for PV recovery at start of day. Port PV onboard and secure. Increase tether length by 10 m.

0225 hrs: Deploy port PV (tether = 50 m) and streamer 1.
 1310 hrs: Helicopter on deck for personnel transfer.
 1315 hrs: Helicopter away. La Bouve and Morris depart vessel.
 0329 hrs: Streamer 2 connected to port PV and going wide.
 0358 hrs: Streamer 3 connected to port PV and going wide.
 0445 hrs: Streamer 4 connected to port PV and going wide.
 0458 hrs: Port streamers in temporary tow position (50 m further out from marks).
 0510 hrs: Recovery stbd PV to increase tether length by 10 m.
 0535 hrs: Streamer 5 stacked over streamer 2.
 0605 hrs: Streamer 6 stacked over streamer 3.
 0625 hrs: Streamer 7 stacked over streamer 4.
 0630 hrs: Stbd PV onboard and secure. Increase tether length by 10 m.
 0730 hrs: Deploy stbd PV (tether = 50 m) and streamer 8.
 0821 hrs: Streamer 7 connected to stbd PV and going wide.
 0843 hrs: Streamer 6 connected to stbd PV and going wide.
 0845 hrs: Commence 90 minute pre-soft start cetacean monitoring.
 0902 hrs: Streamer 5 connected to stbd PV and going wide.
 0915 hrs: Deploy source arrays.
 0939 hrs: All streamers in tow position.
 1005 hrs: Source arrays in tow position.
 1014 hrs: Adjust and fine tune in-line and cross-line geometry separations. Streamers 1 and 8 appear stable. PV wash effect reduced.
 1015 hrs: Commence source array soft start and cetacean monitoring.
 1045 hrs: Source arrays at full volume.
 1151 hrs: Commence 2-boat timing verification and trigger configuration.
 1518 hrs: 2-boat timing erratic. Configuration file sent to CSL for analysis. Head for prime sequence 017.
 1530 hrs: Recover port centre sub-array to repair P-4 (autofiring).
 1657 hrs: Deploy port centre sub-array.
 1712 hrs: Port centre sub-array in tow position.
 1730 hrs: Commence source array soft start and cetacean monitoring.
 1750 hrs: Source arrays at full volume.

Record 1520P1, sequence 017, >011°, 16 CMP prime, volume: 4450/ 4450.
 FPSP: 1001/ LPSP: 2117.
 Line complete.

1842 hrs: Vessel passing 90 m clear of Bream 'B'.

Wx: 335° at 3 m/s, 1.0 m combined sea and swell.

Line change prime.

2038 hrs: Commence 2-boat timing verification.
 2045 hrs: Recover port inboard sub-array to repair P-10 (erratic).
 2157 hrs: Deploy port inboard sub-array.
 2220 hrs: Port inboard sub-array in tow position.
 2244 hrs: 2-boat triggers erratic. Unable to Flip-Flop-Flap. CSL and ATG investigating.
 2250 hrs: Commence source array soft start and cetacean monitoring.
 2310 hrs: Source arrays at full volume.

Record 1808P1, sequence 018, >191°, 16 CMP prime, volume: 4450/ 4450.
 FPSP: 1997/ LPSPD: 1708.
 Line in progress at end of day.

Wx: 290° at 2 m/s, 1.0 m combined sea and swell.

Vessel	SR/V Veritas Viking2
--------	----------------------

5/22/2006

On approach to sequence 043 at start of day.

0004 hrs: Viking2 stbd source arrays in tow position.
0025 hrs: Stbd workboat onboard and secure.
0120 hrs: Pacific Sword source array soft start.

Line change extended to maintain tidal sequence.

0148 hrs: Abort attempt at sequence 043 due to source array air leak. Pacific Sword source arrays disabled.
Source array airleak. Pacific Sword downtime.

0149 hrs: Continue race track to maintain tidal sequence.
0150 hrs: Vessel out of Spectra steering to move clear of platform Bream 'A'.
0155 hrs: Pacific Sword moving 1 nm clear of Viking2.
0500 hrs: Pacific Sword in position - airleak rectified.
0520 hrs: Pacific Sword source array soft start.
0540 hrs: Pacific Sword at full volume.
0558 hrs: Abort attempt at sequence 043 due to excessive swell noise. Wx: 240° 13 m/s, 2.0-2.5 m combined sea and swell.
0602 hrs: Vessel out of Spectra steering to move clear of platform Bream 'B'.
0608 hrs: Pacific Sword moving 1 nm clear of Viking2.
0618 hrs: Predicted SOL sequence 042.

Weather stand-by. Vessel continuing race track to maintain tidal sequence.

0800 hrs: Wx = 260° at 14 m/s, 2.5 m combined sea and swell.
0905 hrs: Pacific Sword in position.
0940 hrs: Pacific Sword source array soft start.
1000 hrs: Pacific Sword at full volume.
1011 hrs: Abort attempt at sequence 043 due to excessive swell noise. Wx: 230° 14 m/s, 3.0 m combined sea and swell (increasing).
1015 hrs: Vessel out of Spectra steering to move clear of platform Bream 'A'.
1016 hrs: Pacific Sword moving 1 nm clear of Viking2.
1200 hrs: Wx = 180° at 15 m/s, 3.0 m combined sea and swell.
1400 hrs: Wx = 180° at 11 m/s, 3.0 m combined sea and swell.
1423 hrs: Pacific Sword in position.
1428 hrs: Pacific Sword source array soft start.
1443 hrs: Abort attempt at sequence 043 due to excessive swell noise. Wx: 190° 10 m/s, 3.0 m combined sea and swell.
1448 hrs: Vessel out of Spectra steering to move clear of platform Bream 'B'.
1450 hrs: Pacific Sword moving 1 nm clear of Viking2.
1508 hrs: Recover source arrays. Plan to recover streamer 4 during period of inclement weather for preventive maintenance.
1600 hrs: Wx = 170° at 8 m/s, 3.0 m combined sea and swell.
1627 hrs: Source arrays onboard and secure.
1800 hrs: Wx = 180° at 9 m/s, 3.0 m combined sea and swell.
1920 hrs: Recover streamer 4 to active section 22 (noisy channels).
2112 hrs: Replace active section 22.
2152 hrs: Deploy streamer 4.
2350 hrs: Streamer 4 in tow position.
2353 hrs: Deploy source arrays.

On approach to sequence 043 at end of day. Wx: 140° at 10 m/s, 2.5 m combined sea and swell.

5/23/2006

Date	Comments
Vessel	SR/V Veritas Viking2

Weather stand-by. Heading for 'Adverse Weather Loitering Area' at start of day. Pacific Sword clear of Viking2. Wx: 160° at 9 m/s, 4.0 m combined sea and swell.

0015 hrs: Viking2 source arrays onboard and secure.
0100 hrs: Wx = 200° at 10 m/s, 4.0 m combined sea and swell.
0300 hrs: Wx = 180° at 13 m/s, 4.0 m combined sea and swell.
0425 hrs: Enter loitering zone.
0500 hrs: Wx = 200° at 15 m/s, 4.5 m combined sea and swell.
0700 hrs: Wx = 190° at 14 m/s, 4.5 m combined sea and swell.
0740 hrs: Pacific Sword recovering source arrays.
0900 hrs: Wx = 175° at 10 m/s, 4.0 m combined sea and swell.
1100 hrs: Wx = 180° at 5 m/s, 4.0 m combined sea and swell.
1300 hrs: Wx = 175° at 10 m/s, 4.0 m combined sea and swell.
1400 hrs: Undershoot vessel 'M/V Pacific Sword' off station. Released from the program area, enroute to BBT for crew change.
1500 hrs: Wx = 260° at 8 m/s, 4.0 m combined sea and swell.
1700 hrs: Wx = 220° at 11 m/s, 3.5 m combined sea and swell.
1900 hrs: Wx = 200° at 13 m/s, 3.5 m combined sea and swell.
2100 hrs: Wx = 190° at 11 m/s, 3.5 m combined sea and swell.
2300 hrs: Wx = 170° at 10 m/s, 4.0 m combined sea and swell.

Vessel in 'Adverse Weather Loitering Area' at end of day. Streamers in tow position and stable.

5/25/2006

Weather stand-by. Vessel in 'Adverse Weather Loitering Area' at start of day. Streamers in tow position and stable. Wx: 180° at 12 m/s, 3.5 m combined sea and swell.

0200 hrs: Wx = 180° at 09 m/s, 3.5 m combined sea and swell.
0341 hrs: Commence turn back towards the Greater Bream work site.
0400 hrs: Wx = 215° at 10 m/s, 3.5 m combined sea and swell.
0600 hrs: Wx = 190° at 11 m/s, 3.5 m combined sea and swell.
0800 hrs: Wx = 180° at 10 m/s, 3.0 m combined sea and swell.
1000 hrs: Undershoot vessel 'M/V Pacific Sword' back on location. Crew change complete.
1000 hrs: Wx = 180° at 12 m/s, 3.0 m combined sea and swell.
1145 hrs: Viking2 DTN enabled. Radio link established with Pacific Sword.
1200 hrs: Wx = 180° at 12 m/s, 3.0 m combined sea and swell.
1400 hrs: Wx = 160° at 08 m/s, 3.0 m combined sea and swell.
1525 hrs: Pacific Sword deploying source arrays.
1545 hrs: Commence 90 minute pre-soft start cetacean monitoring.
1600 hrs: Wx = 160° at 10 m/s, 3.0 m combined sea and swell.
1608 hrs: Deploy source arrays.
1707 hrs: Source arrays in tow position.
1715 hrs: Pacific Sword source arrays in tow position.
1730 hrs: Pacific Sword source array soft start.
1743 hrs: Abort attempt at sequence 044 due to excessive swell noise break-out.
1748 hrs: Vessel out of Spectra steering to move clear of platform Bream 'B'.
1750 hrs: Pacific Sword moving 1 nm clear of Viking2.
1755 hrs: Vessel continuing race track to maintain tidal sequence.
1800 hrs: Wx = 160° at 08 m/s, 3.0 m combined sea and swell.
2000 hrs: Wx = 145° at 07 m/s, 2.5 m combined sea and swell.
2215 hrs: Pacific Sword source array soft start.
2235 hrs: Pacific Sword at full volume.
2247 hrs: Abort attempt at sequence 044 due to excessive swell noise break-out.
2250 hrs: Vessel out of Spectra steering to move clear of platform Bream 'A'.
2253 hrs: Pacific Sword moving 1 nm clear of Viking2.

Vessel heading for sequence 044 at end of day. Vessel continuing race track to maintain tidal sequence. Wx: 170° at 09 m/s, 2.5 m combined sea and swell.

5/26/2006

Weather stand-by. Vessel heading for sequence 044 at start of day. Wx: 170° at 09 m/s, 2.5 m combined sea and swell.

0200 hrs: Wx = 167° at 07 m/s, 2.5 m combined sea and swell.
0240 hrs: Pacific Sword source array soft start.
0300 hrs: Pacific sword at full volume.

Date	Comments
Vessel	SR/V Veritas Viking2

Weather stand-by.

0303 hrs: Source arrays onboard and secure.
0310 hrs: Recover streamer 5.
0600 hrs: Wx = 180° at 12 m/s, 3.0 m combined sea and swell.
0800 hrs: Wx = 190° at 10 m/s, 3.0 m combined sea and swell.
0935 hrs: Replace active section 12 (leakage pulsing). Run tests.
0953 hrs: New active section 12 proves good. Deploy streamer 5.
1000 hrs: Wx = 200° at 7 m/s, 3.0 m combined sea and swell.
1020 hrs: Replace CMU S5C8 (erratic depth keeping).
1025 hrs: Replace active section 14 (low capacitance). Run tests.
1049 hrs: New active section 14 proves good. Deploy streamer 5.
1127 hrs: Recover streamer 5 to CMU S5C4 due to erratic depth keeping.
1200 hrs: Wx = 200° at 7 m/s, 3.0 m combined sea and swell.
1230 hrs: Relace CMU S5C4 (erratic depth keeping).
1238 hrs: Deploy streamer 5.
1400 hrs: Wx = 230° at 10 m/s, 3.0 m combined sea and swell.
1540 hrs: Streamer 5 in tow position.
1600 hrs: Wx = 200° at 9 m/s, 3.0 m combined sea and swell.
1608 hrs: Recover streamer 4.
1800 hrs: Wx = 170° at 10 m/s, 3.0 m combined sea and swell.
2000 hrs: Wx = 180° at 10 m/s, 3.0 m combined sea and swell.
2015 hrs: Replace active section 11 (low capacitance). Run tests.
2024 hrs: New active section 11 proves good. Deploy streamer 4.
2111 hrs: Black ship - port ME failure. Stbd ME online. Propulsion good.
2115 hrs: Chase/ support vessel 'Swissco 168' instructed to get in position to take-up tow.
2121 hrs: Azimuth thruster locked down and engaged.
2123 hrs: Vessel power restored.
2134 hrs: Port ME back online. Investigation pending for ME failure.
2155 hrs: Continue deploying streamer 4 - HPU back online.
2252 hrs: Azimuth thruster stowed.
2300 hrs: Commence 90 minute pre-soft start cetacean monitoring.
2351 hrs: Deploy source arrays.

Heading for an attempt at sequence 070 at end of day. Wx: 180° at 8 m/s, 3.0 m combined sea and swell.

6/3/2006

Weather stand-by. Heading for an attempt at sequence 070 at start of day. Wx: 200° at 8 m/s, 3.0 m combined sea and swell.

0000 hrs: Supply vessel 'Lady Kari-Ann' on station for FO, stores and equipment transfer. Resupply operations cancelled due to adverse wind and sea conditions. 'Lady Kari-Ann' on stand-by.
0006 hrs: Streamer 4 in tow position.
0037 hrs: Commence 90 minute pre-soft start cetacean monitoring.
0050 hrs: Source arrays in tow position.
0056 hrs: Abort attempt at sequence 070 due to excessive swell noise. Average random noise level = >8 microbars RMS. Continue race track.
0200 hrs: Wx = 230° at 4 m/s, 3.0 m combined sea and swell.
0310 hrs: Recover source arrays to adjust and fine tune cross-line streamer separations.
0350 hrs: Source arrays onboard and secure.
0400 hrs: Wx = 190° at 5 m/s, 3.0 m combined sea and swell.
0600 hrs: Wx = 180° at 6 m/s, 3.0 m combined sea and swell.
0610 hrs: Commence 90 minute pre-soft start cetacean monitoring.
0613 hrs: All streamers in tow position. Cross-line separations prove good.
0620 hrs: Deploy source arrays.
0705 hrs: Source arrays in tow position.
0730 hrs: Abort attempt at sequence 070 due to excessive swell noise. Average random noise level = >8 microbars RMS. Continue race track.
0800 hrs: Wx = 180° at 5 m/s, 3.0 m combined sea and swell.
1000 hrs: Wx = 170° at 10 m/s, 3.0 m combined sea and swell.
1200 hrs: Wx = 175° at 11 m/s, 3.0 m combined sea and swell.
1318 hrs: Abort attempt at sequence 070 due to excessive swell noise. Average random noise level = >9 microbars RMS. Continue race track.
1400 hrs: Wx = 130° at 5 m/s, 3.0 m combined sea and swell.
1600 hrs: Wx = 175° at 5 m/s, 3.0 m combined sea and swell.
1800 hrs: Wx = 170° at 10 m/s, 3.0 m combined sea and swell.
2000 hrs: Wx = 180° at 10 m/s, 3.0 m combined sea and swell.
2200 hrs: Wx = 195° at 6 m/s, 2.5 m combined sea and swell.
2340 hrs: Commence source array soft start and cetacean monitoring.

On approach to sequence 070 at end of day. Wx: 170° at 9 m/s, 2.5 m combined sea and swell.

	Line change prime.
	0102 hrs: Stbd workboat onboard and secure. 0105 hrs: Chase/ support vessel 'Lady Rula' on station. 'Swissco 168' released from the program area for crew change. 0200 hrs: Commence source array soft start and cetacean monitoring. 0220 hrs: Source arrays at full volume.
	Record 1296F1, sequence 081, >191°, progressive infill, volume: 4450/ 4450. FPSP: 1997/ LPSP: 881. Line complete.
	Wx: 300° at 3 m/s, 1.0 m combined sea and swell.
	Line change infill.
	0705 hrs: Commence source array soft start and cetacean monitoring. 0725 hrs: Source arrays at full volume.
	Record 1728F1, sequence 082, >011°, progressive infill, volume: 4450/ 4450. FPSP: 1001/ LPSP: 2117. Line complete.
	Wx: Light airs, 1.0 m combined sea and swell.
	Line change infill.
	1025 hrs: Recover stbd centre sub-array to repair element S-10 (leakage). 1040 hrs: Chase/ support vessel 'Swissco 168' back on station. 'Lady Rula' released from the program area. 1144 hrs: Stbd centre sub-array in tow position. 1225 hrs: Commence source array soft start and cetacean monitoring. 1245 hrs: Source arrays at full volume.
	Record 1152P1, sequence 083, >191°, 16 CMP prime, volume: 4450/ 4450. FPSP: 1997/ LPSP: 881. Line complete.
	Wx: Light airs, 1.0 m combined sea and swell.
	Line change prime.
	1745 hrs: Commence source array soft start and cetacean monitoring. 1805 hrs: Source arrays at full volume.
	Record 1728F2, sequence 084, >011°, progressive infill, volume: 4450/ 4450. FPSP: 1001/ LPSP: 2117. Line complete.
	Wx: 300° at 5 m/s, 1.0 m combined sea and swell.
	Line change infill.
	2110 hrs: Recover stbd centre sub-array to repair element S-10 (erratic). 2319 hrs: Stbd centre sub-array in tow position. 2320 hrs: Commence source array soft start and cetacean monitoring. 2340 hrs: Source arrays at full volume.
	Record 1152F1, sequence 085, >191°, progressive infill, volume: 4450/ 4450. FPSP: 1997/ LPSPD: 1907. Line in progress at end of day.
	Wx: 290° at 5 m/s, 1.0 m combined sea and swell.
6/8/2006	
	Record 1152F1, sequence 085, >191°, progressive infill, volume: 4450/ 4450. FPSPD: 1906/ LPSP: 881. Line complete.
	Wx: 290° at 5 m/s, 1.0 m combined sea and swell.

Date	Comments
Vessel	SR/V Veritas Viking2
	Line change infill.
	0345 hrs: Commence source array soft start and cetacean monitoring. 0405 hrs: Stbd workboat away for inwater front-end geometry inspection. 0410 hrs: Source arrays at full volume. 0417 hrs: Commence energy source output test - sub-arrays 1 and 4 active. 0424 hrs: Output test complete. 0430 hrs: Stbd work boat onboard and secure.
	Record 1424P1, sequence 086, >011°, 16 CMP prime, volume: 4450/ 4450. FPSP: 1001/ LPSP: 2117. Line complete.
	Wx: Light airs, 1.0 m combined sea and swell.
	Line change prime.
	0910 hrs: Commence source array soft start and cetacean monitoring. 0930 hrs: Source arrays at full volume.
	Record 1136P1, sequence 087, >191°, 16 CMP prime, volume: 4450/ 4450. FPSP: 1997/ LPSP: 881. Line complete.
	Wx: Light airs, 1.0 m combined sea and swell.
	Line change prime.
	1225 hrs: Commence energy source output test - sub-arrays 2 and 5 active. 1231 hrs: Output test complete. 1410 hrs: Commence source array soft start and cetacean monitoring. 1430 hrs: Source arrays at full volume.
	Record 1408P1, sequence 088, >011°, 16 CMP prime, volume: 4450/ 4450. FPSP: 1001/ LPSP: 2117. Line complete.
	Wx: Light airs, 0.5 m combined sea and swell.
	Line change prime.
	1915 hrs: Commence source array soft start and cetacean monitoring. 1935 hrs: Source arrays at full volume.
	Record 1120P1, sequence 089, >191°, 16 CMP prime, volume: 4450/ 4450. FPSP: 1997/ LPSP: 881. Line complete.
	Wx: Light airs, 0.5 m combined sea and swell.
	Line change prime.

Date	Comments
Vessel	SR/V Veritas Viking2

6/12/2006

Weather stand-by. Heading for Bream worksite at start of day. Wx: 270° at 14 m/s, 3.0 m combined sea and swell.

0200 hrs: ExxonMobil endorsed 'Safety Stand Down' adjourned - 3 hours complete.
 0230 hrs: Wx = 270° at 13 m/s, 3.0 m combined sea and swell.
 0225 hrs: Abort attempt at prime sequence 098 due to excessive swell noise. Average random noise level = >12 microbars RMS. Continue race track.
 0300 hrs: Recommence ExxonMobil endorsed 'Safety Stand Down'.
 0400 hrs: Wx = 260° at 12 m/s, 3.0 m combined sea and swell.
 0600 hrs: ExxonMobil endorsed 'Safety Stand Down' complete (6 hours total). Safety awareness videos screened and vessel specific JSA's discussed and generated. All seismic crew in attendance.
 0630 hrs: Wx = 260° at 14 m/s, 3.0 m combined sea and swell.
 0800 hrs: Wx = 270° at 13 m/s, 3.0 m combined sea and swell.
 1000 hrs: Wx = 260° at 13 m/s, 3.0 m combined sea and swell.
 1200 hrs: Wx = 285° at 12 m/s, 2.5 m combined sea and swell.
 1400 hrs: Wx = 270° at 12 m/s, 2.5 m combined sea and swell.
 1500 hrs: Weather conditions improving - head for prime sequence 098.
 1600 hrs: Commence 90 minute pre-soft start cetacean monitoring.
 1618 hrs: Deploy source arrays.
 1700 hrs: Wx = 270° at 10 m/s, 2.0 m combined sea and swell.
 1721 hrs: Source arrays in tow position.
 1740 hrs: Commence source array soft start and cetacean monitoring.
 1800 hrs: Source arrays at full volume.

Record 1072P1, sequence 098, >191°, 16 CMP prime, volume: 4450/ 4450.
 FPSP: 1997/ LPSP: 881.
 Random low frequency swell noise break-out visible on streamers.
 Line complete.

Wx: 270° at 11 m/s, 2.0 m combined sea and swell.

Line change prime.

2051 hrs: Recover port source arrays to adjust sub-array separation tether.
 2110 hrs: Port source arrays in tow position.
 2245 hrs: Azimuth thruster locked down and engaged for testing.
 2250 hrs: Commence source array soft start and cetacean monitoring.
 2257 hrs: Recover stbd source arrays to adjust sub-array separation tether.
 2309 hrs: Stbd source arrays in tow position.
 2310 hrs: Source arrays at full volume.
 2314 hrs: Azimuth thruster stowed. Tests complete.

Record 1344F1, sequence 099, >011°, progressive infill, volume: 4450/ 4450.
 FPSP: 1001/ LPSPD: 1212.
 Random low frequency swell noise break-out visible on streamers.
 Line in progress at end of day.

Wx: 290° at 12 m/s, 2.0 m combined sea and swell.

6/13/2006

Record 1344F1, sequence 099, >011°, progressive infill, volume: 4450/ 4450.
 FPSPD: 1213/ LPSP: 2117.
 Random low frequency swell noise break-out visible on streamers.
 Line complete.

Wx: 290° at 12 m/s, 2.0 m combined sea and swell.

Line change infill.

0219 hrs: Recover port source arrays to adjust sub-array separation tether.
 0256 hrs: Port source arrays in tow position.
 0420 hrs: Commence source array soft start and cetacean monitoring.
 0440 hrs: Source arrays at full volume.

Record 1056P1, sequence 100, >191°, 16 CMP prime, volume: 4450/ 4450.
 FPSP: 1997/ LPSP: 881.
 Line rejected due to excessive swell noise. Do Not Process.

Wx: 260° at 16 m/s, 2.0 m combined sea and swell.

Date	Comments
------	----------

Vessel	SR/V Veritas Viking2
--------	----------------------

Line change.

0950 hrs: Commence source array soft start and cetacean monitoring.
1010 hrs: Source arrays at full volume.

Line change extended due to adverse wind and sea conditions. Turn radius increased to 3000 m.

Record 1328P1, sequence 101, >011°, 16 CMP prime, volume: 4450/ 4450.
FPSP: 1001/ LPSP: 2117.
Random low frequency swell noise break-out visible on streamers.
Line complete.

Wx: 290° at 13 m/s, 2.0 m combined sea and swell.

Line change prime.

1308 hrs: Recover port source arrays to repair P-4 (erratic) and adjust sub-array separation tether.
1500 hrs: Commence source array soft start and cetacean monitoring.
1517 hrs: Port source arrays in tow position.
1520 hrs: Source arrays at full volume.

Record 1056P2, sequence 102, >191°, 16 CMP prime, volume: 4450/ 4450.
FSP: 1997/ LSP: 1994.
Line aborted due to poor sub-array separations. Do Not Process.
Continue down sail line while effecting repairs.

Wx: 290° at 12 m/s, 2.0 m combined sea and swell.

1545 hrs: Recover port source arrays to rectify poor sub-array separations.

1605 hrs: Port outboard sub-array tangled in streamer 4 head support float.
1610 hrs: Port outboard sub-array crossed over OTL 4. Make several vessel heading adjustments to make free.
1641 hrs: Heading adjustments not working. Recover OTL 4 and port outboard sub-array together.
1714 hrs: Port outboard sub-array onboard and secure. No damage visible.
1821 hrs: Streamer 4 frontend onboard. Replace CMU S4C18 (lost at sea) and re-secure CMU S4C19 (off collars).
1837 hrs: Deploy streamer 4.
1916 hrs: Streamer 4 back in tow position.
1918 hrs: Deploy port source arrays.
1954 hrs: Port source arrays in tow position.
2100 hrs: Commence 90 minute pre-soft start cetacean monitoring.
2225 hrs: Commence source array soft start and cetacean monitoring.
2245 hrs: Source arrays at full volume.

Record 1328F1, sequence 103, >011°, progressive infill, volume: 4450/ 4450.
FPSP: 1001/ LPSPD: 1530.
Random low frequency swell noise break-out visible on streamers.
Line in progress at end of day.

Wx: 300° at 12 m/s, 2.0 m combined sea and swell.

6/14/2006

Record 1328F1, sequence 103, >011°, progressive infill, volume: 4450/ 4450.
FPSPD: 1531/ LPSP: 2117.
Mild to moderate swell noise energy visible on streamers.
Line complete.

0040 hrs: 'Swissco 168' off station. 'Lady Rula' on station.

Wx: 290° at 12 m/s, 2.0 m combined sea and swell.

Line change infill.

0310 hrs: Commence source array soft start and cetacean monitoring.
0330 hrs: Source arrays at full volume.

Record 1056P3, sequence 104, >191°, 16 CMP prime, volume: 4450/ 4450.
FPSP: 1997/ LPSP: 881.
Mild to moderate swell noise energy visible on streamers.
Prime reshoot of sequence 102 due to poor sub-array separations. Line complete.

Wx: 275° at 12 m/s, 2.0 m combined sea and swell.

 1300 hrs: Wx = 255° at 10 m/s, 2.5 m combined sea and swell.
 1313 hrs: Abort attempt at prime sequence 109 due to excessive swell noise. Average random noise level = >10 microbars RMS. Continue race track.
 1500 hrs: Wx = 230° at 9 m/s, 2.5 m combined sea and swell. Wx improving.
 1630 hrs: Commence 90 minute pre-soft start cetacean monitoring.
 1638 hrs: Deploy source arrays.
 1738 hrs: Source arrays in tow position.
 1900 hrs: Commence source array soft start and cetacean monitoring.
 1920 hrs: Source arrays at full volume.

Record 1040P2, sequence 109, >191°, 16 CMP prime, volume: 4450/ 4450.
 FPSP: 1997/ LPSP: 881.
 Mild to moderate swell noise energy visible on streamers.
 Prime reshoot of sequence 108 due to excessive swell noise. Line complete.

Wx: 250° at 9 m/s, 2.0 m combined sea and swell.

Line change prime.

On approach to progressive infill sequence 110 at end of day.

6/17/2006

Line change prime. On approach to progressive infill sequence 110.

0005 hrs: Commence source array soft start and cetacean monitoring.
 0025 hrs: Source arrays at full volume.

Record 1312F2, sequence 110, >011°, progressive infill, volume: 4450/ 4450.
 FPSP: 1001/ LPSP: 2117.
 Mild to moderate swell noise energy visible on streamers.
 Line complete.

Wx: 260° at 8 m/s, 2.0 m combined sea and swell.

Line change infill.

0500 hrs: Commence source array soft start and cetacean monitoring.
 0520 hrs: Source arrays at full volume.

LINE PRODUCTION LOG

(Sorted by Sequence Number)

Vessel(s) : SR/V Veritas Viking II
 Prospect : Greater Bream 3D
 Client : ExxonMobil
 Dates : 22-Apr-2006 to 13-Jul-2006
 Job # : 20323,20324

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.
 Line shot in 2D mode using Stbd source.
 Gun depths occasionally fluctuating d/t swell, max 6.7m
 SP 1830 - EOL: Screw/ Rig noise H-T @ 30µB (Max) from port side

PROCESSING QC COMMENTS

Negligible swell noise. Low seps S4-5 d/t WSP 3.8kts
 Strum and head wave energy is observed along the line
 Localised noise from starboard side as passing rig loading supply vessel, amplitude ~ 20ubar

SR/V Veritas Viking II

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.
 Line shot in 2D mode using Stbd source.
 SP 1323 Gun S-4 disabled d/t misfires and Spare gun S-3 enabled. Vol still 4450 cu.in
 SP 1486 Gun S-10 disabled d/t flagged autofires and Spare gun S-12 enabled. Vol still 4450 cu.in

PROCESSING QC COMMENTS

Mild swell noise affecting <5% of traces.
 Strum and head wave energy is observed along the line
 Shots flagged with a larger than expected volume error were qc'd, and the amplitude spectra appeared normal, compared to adjacent shots

ONLINE COMMENTS

All gunstrings operating with gun # 4's as Spare
 Mild swell noise visible on RMS Display for all streamers

PROCESSING QC COMMENTS

Mild to moderate swell energy throughout, affecting 10 to 20% traces, occasionally penetrating beyond 3 sec twt.
 Swell energy is getting weaker and data quality improved after SP 1400
 Strum and head wave energy also apparent.

ONLINE COMMENTS

All gunstrings operating with gun # 3's as Spare
 Guns depths fluctuating d/t swell conditions
 Swell noise visible on RMS Display for all streamers

PROCESSING QC COMMENTS

Shots show about 60 % traces affected by moderate swell noise towards end of lines
 Strum and head wave energy also apparent.

SR/V Veritas Viking II

ONLINE COMMENTS

Original line G06A-1040P1-108 DNP'd d/t excessive swell noise
 All gunstrings operating with gun # 3's as Spare
 Random gun depth errors d/t swell conditions
 Gun separations between Port sub arrays occasionally out of spec (High separations)

PROCESSING QC COMMENTS

Moderate swell throughout, affecting 10 to 20% traces, occasionally penetrating beyond 2sec twt.

ONLINE COMMENTS

Original line G06A -1056P1 -100 was DNP'd by client d/t excessive ambient noise
 Original line G06A - 1056P2 - 102 was deemed DNP d/t narrow seperation (4.9m) between port outer and port middle gun string
 All gunstrings operating with gun # 3's as Spare
 Swell noise visible on RMS Display affecting up to 50% of all streamers
 Guns at fluctuating depth d/t Wx

PROCESSING QC COMMENTS

Mild to moderate energy level of swell noise observed on the shots gathers.
 Strum and head wave energy also apparent.

SR/V Veritas Viking II

PROCESSING QC COMMENTS

No discernible swell noise.
 Strum and head wave energy observed.
 Diffraction energy observed midway along line.

ONLINE COMMENTS

PROCESSING QC COMMENTS

Shots free from any discernable swell noise.
 Diffraction observed on shots at 3.5 to 4 sec timegate at the midway of the line.
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

ONLINE COMMENTS

SP 1450, Paying out 2m on Port and Stbd vane to increase separation with S4/S5

PROCESSING QC COMMENTS

No swell noise observed from every 200th shot interval QC samples
 Diffraction observed on shots
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

ONLINE COMMENTS

Random swell noise outbreak seen on QC screens and Plots
 Bird S5C4 running shallow, effecting traces 15 to 50 showing noise on QC screens.

PROCESSING QC COMMENTS

Occasional swell bursts affecting < 10% traces. Off end and broadside diffractons observed. Mild strum noise apparent.
 Work boat's screw noise appeared on the noise analysis map while coming back to vessel. Affecting from starboard streamers at SOL's SP 1997 to SP 1872; accrossing channel 2599 to the stern.

ONLINE COMMENTS

All Gun 3's used as Spare Only

PROCESSING QC COMMENTS

Less than 5% of mild energy swell noise evident on the data.
 Mild strumming and mild screw noise apparent all strms.
 Off end diffraction energy evident for a short period.
 Head wave noise observed along the line.

ONLINE COMMENTS

Random swell noise outbreak seen on QC screens and plots

PROCESSING QC COMMENTS

Moderate swell noise affecting 5-10% traces, occasionally penetrating beyond 2500msec.
 Screw noise and strum noise evident.

ONLINE COMMENTS

Files 79-98 Gun signature tests conducted on Gun S-12
 No gun signature tests conducted on Gun S-13 d/t misfires. Unable to get gun to fire. Gun S-13 spared out for this line
 LGSP 883 @ 21:30 UTC D/T engineers accidentally tripping out compressors
 SP's 882-881 recorded to tape but bad shotpoints D/T pressure errors
 Line Complete

PROCESSING QC COMMENTS

Occasional incidences of mild to moderate swell, affecting <5% traces.
 Out of plane diffraction observed midway along line.

ONLINE COMMENTS

PROCESSING QC COMMENTS

No swell noise observed from every 200th shot interval QC samples
 Out of plane diffraction observed midway along line starting at 3.5 sec.
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

ONLINE COMMENTS

All gunstrings operating with gun # 3's as Spare
 Swell noise visible on RMS Display for all streamers
 Guns at fluctuating depth d/t Wx

PROCESSING QC COMMENTS

Shots show 10 to 15 % traces affected by mild to moderate swell noise.
 Diffraction energy observed midway along line at 4.5 to 5 sec.
 Strum and head wave energy also apparent.

SR/V Veritas Viking II

ONLINE COMMENTS

All gunstrings operating with gun # 3's as Spare
 Guns depths fluctuating d/t swell conditions
 SP 1461 Gun S-10 deactivated d/t misfires. Gun S-12 activated. Stbd Array Volume = 4450 cuin.

PROCESSING QC COMMENTS

Occasional moderate swell bursts, affecting up to 10% traces when apparent. Strum and headwave energy observed, together with a diffraction event midway along libne.

ONLINE COMMENTS

All gunstrings operating with gun # 4's as Spare
 Mild swell noise visible on RMS Display for all streamers
 F2 line d/t acquiring coverage missed during 1312F1-107

PROCESSING QC COMMENTS

Moderate swell throughout, affecting 10 to 20% traces, occasionally penetrating beyond 1sec twt.
 Swell energy is getting weaker and data quality improved after SP 1400
 Diffraction energy observed midway along line at 4.5 to 5 sec.
 Strum and head wave energy also apparent.

ONLINE COMMENTS

F3 line d/t acquiring coverage missed during 1312F1-107 & 1312F2-110
 All gunstrings operating with gun # 4's as Spare
 Mild swell noise visible on RMS Display for all streamers

PROCESSING QC COMMENTS

Moderate swell noise throughout, 10-15% traces affected, occasionally penetrating 2 sec twt.
 Diffraction event midway along line
 Strum and headwave energy apparent.

SR/V Veritas Viking II

ONLINE COMMENTS

All gunstrings operating with gun # 3's as Spare
 Swell noise visible on RMS Display for all streamers
 Guns at fluctuating depth d/t Wx

PROCESSING QC COMMENTS

shots show 10 to 20% traces affected by mild to moderate swell noise. Occasionally these break the water bottom.
 Strum and head wave energy also apparent.

ONLINE COMMENTS

All gunstrings operating with gun # 3's as Spare
 Swell noise visible on RMS display for all streamers
 Guns depths fluctuating d/t sea state and swell conditions

PROCESSING QC COMMENTS

Shots show 15 to 20 % traces affected by mild to moderate swell noise. Occasionally these break the water bottom.
 Diffraction energy observed midway along line at 4.5 to 5 sec.
 Strum and head wave energy also apparent.

ONLINE COMMENTS

All gunstrings operating with gun # 3's as Spare
 Depth errors occurring on guns d/t swell conditions
 Swell noise visible on RMS Display for all streamers
 SP 2006 - Deploy Sr 7 out by 10m d/t inadequate separation between S7 and 8
 SP 2006 - S8C1-4 set to 6.5m and S7C1-4 set to 7.5m

PROCESSING QC COMMENTS

Up to 15% traces affected by moderate swell.
 Strum and head wave energy observed.
 Diffraction midway along line.

SR/V Veritas Viking II

ONLINE COMMENTS**PROCESSING QC COMMENTS**

Shots free from any discernable swell noise.
 Diffraction observed on shots at 3.5 to 4 sec timegate at the midway along the line.
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

SR/V Veritas Viking II

ONLINE COMMENTS

PROCESSING QC COMMENTS

occasional mild swell bursts, verging on negligible.
 Strum and head wave energy apparent.
 Diffraction energy observed midway along line, moving to off end - probably stationary pipeline diffractor source.

ONLINE COMMENTS

PROCESSING QC COMMENTS

No swell noise observed from every 200th shot interval QC samples
 Diffraction observed on shots in reverse move out direction at far offset.
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

ONLINE COMMENTS

Slight swell noise observed on shot displays.

PROCESSING QC COMMENTS

Occasional slight towing strum on streamer 8
 Occasional slight swell bursts affecting < 5% of traces
 Autofire visually checked and looks OK

ONLINE COMMENTS

Undershoot with Pacific Sword - single source (Port)
 Pacific Sword position on Port side of V2
 Swell noise seen from astern on all streamers, approx 15% breakout.

PROCESSING QC COMMENTS

Moderate swell noise affecting majority of shots, up to 20% traces affected. Penetrates beyond 3 sec twt.
 Strum noise evident on most cables.
 Offend diffraction evident toward end of line.

SR/V Veritas Viking II

ONLINE COMMENTS

Swell noise observed on shot records

PROCESSING QC COMMENTS

Swell noise evident throughout line - isolated bursts up to a max amp. Of 75uBars
 Slight strum noise on outer cables only

Streamers - TUS Guardian

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Near field data recorded on aux channels 1-12 first 2000 ms	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

Array separation	37.5 m
Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source

ONLINE COMMENTS

PROCESSING QC COMMENTS

Negligible swell noise on shots.
 Mild screw noise, and strum visible.
 Out of plane energy apparent midway along line - probably rig induced noise.

ONLINE COMMENTS

Occasionally gun depth errors d/t sea state and swell conditions
 Occasional bird depth fluctuation d/t sea state and swell conditions

PROCESSING QC COMMENTS

Moderate swell noise affecting 15-25% traces, occasionally penetrating beyond 3000msec.
 Mild screw noise, and strum visible. Head wave noise observed along the line.
 Out of plane energy apparent midway along line.

ONLINE COMMENTS

Occasional bird depth fluctuation d/t sea state and swell conditions

PROCESSING QC COMMENTS

Moderate swell noise affecting 15-20% traces, occasionally penetrating beyond 3000msec, appear as mild to medium level of swell noise energy. Mild screw noise, and strum visible. Head wave noise observed along the line. Out of plane energy apparent midway along line. Diffraction energy appear at 3.5 sec near the rig.

ONLINE COMMENTS

Original line G06A-1680F1-070 and line G06A-1680F2-071 was deemed DNP by clients d/t excessive swell noise
 Line G06A-1680F3-073 never acquired adequate coverage
 16 CDP Progressive Infill. CDP's 1673-1688
 SP 2030 Gun S-13 deactivated. Stbd array volume = 4120cuin
 SP 2037 Gun S-12 activated. Stbd array volume = 4450cuin

PROCESSING QC COMMENTS

Shots generally free from unwanted noise, but showing occasional moderate swell noise, affecting ~5% traces on those shots affected at all.
 Out of plane diffraction apparent midway along line.
 Strumming evident, all cables.
 Head wave energy visible.

SR/V Veritas Viking II

ONLINE COMMENTS

Files 79-98 Gun signature tests conducted on gun S-13
 SP's 1002-1020 Flagged as volume errors on GCS90 d/t incorrect volume for gun S-13 set in GCS90 software. Read 280cuin. Actual 330cuin
LGSP 1643 @ 01:32 UTC d/t airleak on Stbd middle gunstring
FGSP 1677 @ 01:36 UTC. SP's 1644-1676 bad gun signature. (33 shotpoints)
 Line incomplete d/t airleak on the Stbd middle gunstring.

PROCESSING QC COMMENTS

No swell noise observed.
 Out of plane diffraction observed midway along line at 4.5 to 5 sec timegate.
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

SR/V Veritas Viking II

SOL/EOL Comments

Reshoot of Seq 001 which was DNP'd d/t streamer seps.

Overall Line Observations

STBD gun strings DI's erratic, reading deep.

DNP due to source imbalance (>1.5 dB) on 24th May after extensive quality control.

Birds bad/poll disabled:

Birds deep/shallow:

ONLINE COMMENTS

Original line G06A-1728P1-001 DNP'd d/t streamer separations and line G06A-1728P2-003 DNP'd d/t source imbalance

PROCESSING QC COMMENTS

Negligible swell observed on shots.
 Strum noise and head wave energy evident all strms.
 Out of plane diffraction midway along line.

ONLINE COMMENTS

PROCESSING QC COMMENTS

No swell noise observed from every 200th shot interval QC samples
 Out of plane diffraction observed midway along line starting at 5 sec.
 Mild screw noise, and strum visible. Head wave noise observed along the line due to data is clean due to the calm sea condition

SR/V Veritas Viking II

ONLINE COMMENTS

Original progressive infill pass G06A-1728F1-082 never acquired all necessary coverage
 SP 1443 Gun S-10 deactivated d/t erratic behavior. Gun S-12 activated. Stbd array volume 4450cuin

PROCESSING QC COMMENTS

Negligible swell on shots.
 Strum and head wave energy apparent on shots.
 Diffraction observed on shots - likely stationary object reflector is pipeline.

SR/V Veritas Viking II

ONLINE COMMENTS

All gun strings operating with gun # 3 as spare.
 Seg 1: SPs 1001 - 1215
 Seg 2: SPs 1635 - 1725
 Gun depths fluctuating d/t swell
 Moderate swell noise (max 20µB) affecting 5-10% of traces

PROCESSING QC COMMENTS

Mild swell noise affecting < 5% of traces.
 Diffraction energy appeared on midway of line, at 5 sec to Tmax time gate.
 Strum and head wave energy is observed along the line

ONLINE COMMENTS

SP 1307-1227 noise seen on shot records from Bream platform.
 DNP SP 1389-1239 d/t low pressure

PROCESSING QC COMMENTS

Occasional slight towing strum on streamer 2 and 8
 Out of plane reflections / rig noise between ~ SP 1100 and SP 1230

SR/V Veritas Viking II

ONLINE COMMENTS

Noise seen on shot records from Bream platform.

PROCESSING QC COMMENTS

Very slight cable strum on streamers 7 and 8
 Occasional slight swell burst affecting ~ 2% of traces
 All autofires visually checked and no autofires found

ONLINE COMMENTS

Undershoot with Pacific Sword - single source (Stbd)
 Pacific Sword position on Stbd side of V2

PROCESSING QC COMMENTS

Screw noise visible on shots - probably due to source vessel.
 Occasional moderate swell bursts, affecting <10% traces, and penetrating to 3secs twt.

Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Note: no near field data recorded due to no NF sensors	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

ONLINE COMMENTS

Undershoot with Pacific Sword - single source (Stbd.)
 Pacific Sword positioned on Stbd. side of V2
 Swell noise observed on shot records

PROCESSING QC COMMENTS

Moderate swell bursts affecting ~ 15% - 20% of traces, mostly below 3s, Occasionally upto 180 uBars, but usually below 50 uBars
 Both misfires visually checked and look OK.

Streamers - TUS Guardian

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Near field data recorded on aux channels 1-12 first 2000 ms	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

Array separation	37.5 m
Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source

ONLINE COMMENTS

PROCESSING QC COMMENTS

Slight strum noise evident on outer cables only.
 Noise on strmr 8 due to fluctuating depth while steering for coverage (~10uBars noise uplift in isolated bursts)
 All autofires visually checked and are good shots.

SR/V Veritas Viking II

ONLINE COMMENTS

Undershoot with Pacific Sword - single source
 Pacific Sword position on PORT side of V2
 Sol noise file taken with a WSP of 4.5k, noise value high d/t sea state
 Slight noise breakouts d/t sea state

PROCESSING QC COMMENTS

Slight cable strum on the outer cables
 Slight to moderate swell bursts affecting ~5% - 10% of traces
 Relatively high amplitude screw noise from the P. Sword around SP 1400 (around Bream A)

TOTAL SHOTS

ONLINE COMMENTS

Undershoot with Pacific Sword - single source (Port)
 Pacific Sword position on Port side of V2
 Swell noise observed on shot records
 DNP d/t source air leak

PROCESSING QC COMMENTS

Swell noise throughout line - 30-45uBars
 Slight strum noise evident on outer cables
 DNP - due to air leak

ONLINE COMMENTS

All gunstrings operating with Gun #3 as spare

PROCESSING QC COMMENTS

Shots free from any discernable swell noise at the every 200th shot interval QC samples
 Strum and head wave energy apparent due to good weather and clean data quality.
 Diffraction event observed midway along line.

SOL/EOL Comments

Overall Line Observations

All gun strings operating with gun # 4 as spare.
 Zone 3 and zone 4 Infill

Birds bad/poll disabled:

Birds deep/shallow:

Status of Streamer Traces:

	Traces Failing Today's Daily Test				Suspect traces seen on Shot Plots & RMS Display		
	Low Capacitance	Open Channel	Leakage	Other	Noisy	Spiking	Weak
S1:					340, 360		
S2:				305 (Phase)	305,305, 345		
S3:	290			339 (Phase)	3		
S4:	106, 110, 148, 177				127		
S5:	75				88,326		
S6:	49,116,158,161,307				29,37,91,205		
S7:	89,100,166, 202, 229, 269, 285		360		164		
S8:	198						

Vessel Manager: Morgan McNelly **Observers:** 00:00-12:00 Neil Collinge, Larry Tan, Rashid Anwar

DNP	Do Not Process	GCS90	Gun Controller
D/T	Due To	RN	Reel Number
D/E	Delta Error	SAP	Source Air Pressure
M/F	Misfire	S/I	Seismic Interference
M/O	Moveout	NAVS	Short Nav Header
RTNU	Real Time Navigation Unit	NCN	Navigation Calculation Node

Client: **Esso Australia Pty. Ltd.**Line name: **G06A-1952F2-184**Seq: **184**Dir: **190.5°****Streamers - TUS Guardian**

Number of streamers:	8
Number of channels per streamer:	360
Group length:	12.5 metres
Receivers / Group:	12
Receiver Type:	TS020 PZT ceramic
Number of compasses per streamer:	19 (20 on S1 & S8)
Active streamer length	4500 metres
Nominal separation between streamers:	75 metres
Near channel inline offset:	75 metres
Far channel inline offset:	4563 metres
Nominal streamer depth :	7 metres
Streamer depth fluctuation allowed :	0.5 metres
Total horizontal separation:	525 metres
Total vertical separation:	0 metres
Auxiliary channels:	12
Time break recorded on aux channel 1 from 1000 ms	
Near field data recorded on aux channels 1-12 first 2000 ms	
<i>Streamer designation:</i>	Streamers 1 - 8 = Port - Starboard
<i>Channel designation:</i>	Channel 1 at tail-end of each streamer Channel 360 at head of each streamer

Seismic Recording System - SYNTRAK 960 24-bit

Nominal fold	60
Sample interval:	2 ms
Record length:	6144 ms
Total number of channels (incl. auxiliary):	2892
Streamer 1 :	Recorded as dataset 1 channels 1 - 360
Streamer 2 :	Recorded as dataset 2 channels 1 - 360
Streamer 3 :	Recorded as dataset 3 channels 1 - 360
Streamer 4 :	Recorded as dataset 4 channels 1 - 360
Streamer 5 :	Recorded as dataset 5 channels 1 - 360
Streamer 6 :	Recorded as dataset 6 channels 1 - 360
Streamer 7 :	Recorded as dataset 7 channels 1 - 360
Auxillary:	Recorded as dataset 8 channels 1 - 12
Streamer 8 :	Recorded as dataset 9 channels 1 - 360
Low cut recording filter:	3(12) Hz(dB/oct)
High cut recording filter:	206(276) Hz(dB/oct)
Digital filter delay:	None
Notch filter:	None
QC filter	5(18) Hz(dB/oct)
Recording medium:	3590
Tape format:	SEGD
Recording format	8036
Recording time delay:	0 ms
Comments:	
<i>Hydrophone sensitivity</i>	20 µvolts / µbar
<i>Recording polarity:</i>	Increase in pressure = -ve number on tape

Source Array - Dual Tuned Bolt Airgun Array

Array separation	37.5 m
Source separation fluctuation allowed:	3.75 m
Nominal source depth:	6 m
Source depth fluctuation allowed:	0.5 m
Overall source array width:	16 m
Overall source array length:	16.5 m
Number of source arrays:	2
Number of active elements per array:	9
Number of spare elements per array:	3
Number of sub arrays per source array:	3
Sub array length:	16.5 m
Sub array separation:	8 m
Sub array separation fluctation allowed:	1.5 m
Nominal source array pressure:	2000 psi
Specified minimum array pressure:	1900 psi
Nominal operating volume per array:	4450 cu. in.
Specified minimum operating volume:	NA
Source shotpoint interval:	18.75 m
Individual source shotpoint interval:	37.5 m
Flip-flop acquisition mode, even shotpoints from stbd source, odd shotpoints from port source
